CERTIFICATE OF THE SECRETARY OF ENVIRONMENTAL AFFAIRS

May 7, 1999

CERTIFICATE OF THE SECRETARY OF ENVIRONMENTAL AFFAIRS
ON THE
DRAFT ENVIRONMENTAL IMPACT REPORT

PROJECT NAME : Logan Airside Improvements Planning Project
PROJECT MUNICIPALITY : Boston/Winthrop
PROJECT WATERSHED : Boston Harbor
EOEA NUMBER : 10458
PROJECT PROPONENT : Massachusetts Port Authority (Massport)
DATE NOTICED IN MONITOR : February 23, 1999

The Secretary of Environmental Affairs hereby determines that the Draft Environmental Impact Report (DEIR) submitted on this project **adequately and properly complies** with the Massachusetts Environmental Policy Act (M.G.L. c. 30, ss. 61-62H) and with its implementing regulations (301 C.M.R. 11.00).

MEPA review is an informal process, which does not itself result in any formal adjudicative decision approving or disapproving a project. Section 11.08(8) of the MEPA Regulations requires me to find a DEIR adequate even if certain aspects of the project require additional description or analysis, so long as the DEIR is generally responsive to the requirements of Section 11.07 and the scope. As described in more detail in this Certificate, after examining the document and the written and oral comments, I have found that the DEIR presents enough information on alternatives, impacts, and mitigation to meet that standard and proceed to the stage of a Final EIR. This determination does not mean that I am satisfied with every aspect of the analysis in the DEIR. The Final EIR must address outstanding issues, including additional mitigation measures, and respond to the substantive comments received.

The Federal Aviation Administration (FAA) is reviewing the project as a Draft Environmental Impact Statement (DEIS) under the National Environmental Policy Act (NEPA). This certificate applies to the review of the project under MEPA only, and does not restrict the ability of the federal government to act on those aspects of the project subject to NEPA.

PROJECT DESCRIPTION

As described in the DEIR, the proponent's preferred alternative includes a 5,000 foot unidirectional runway (Runway 14/32); a 9,300 foot taxiway between Runways 4L/22R and 4R/22L (the Centerfield Taxiway); other taxiway improvements; and reduction of runway approach minima. The DEIR evaluates implementation of Peak Period Pricing, but does not include this measure as part of the preferred alternative. Each of the alternatives was studied for its impacts at different projected future passenger levels: a year 1999 estimate of 29 million, and year 2010 estimates of 37.5 and 45 million. Each level was studied for a "high fleet" with relatively more operations and a "low fleet" with fewer operations.

EXECUTIVE SUMMARY

The proposed project (and especially Runway 14/32) has generated an enormous amount of commentary and controversy, both in the MEPA review of the project and in a much broader political context. This review has brought to a head many long standing concerns about the management of growth at Logan Airport, the environmental and community impacts of that growth, and the mitigation of those impacts.

Within this debate, three principal issues have emerged that will shape the preparation and review of the Final EIR for this project. The first is Logan's role within the regional transportation network. Many commenters have argued that the decision on the DEIR should be deferred until there has been further study of the possible diversion of passenger traffic to other facilities -- notably the regional airports at Providence, Manchester, and Worcester, and Amtrak's new high-speed rail link to New York -- as a solution to problems of congestion and delay at Logan. Some commenters have argued that the only solution to Logan's delay problem is the creation of a new second major airport.

Although I strongly agree on the importance of the regional transportation network, I disagree with the contention that Massport's treatment of this subject in the DEIR has been insufficient. The scope issued by then-Secretary Coxe in 1995 did not require the study of a new second airport, and I am not reopening that issue in the context of this review. The DEIR suggests that the existing airports at Worcester, Manchester, and Providence, seen together, may serve as Boston's "second airport." In the Final EIR, Massport must study the planned improvements at those airports in greater detail, to show the effects upon passenger traffic at Logan. The DEIR already estimates a potential diversion of 7.3 million passengers/year from Logan to regional alternatives by the year 2010, suggesting that future passenger levels at Logan are likely to remain at or below the lower projected level of 37.5 million. If true, this could help allay fears about the impacts of "worst case" projections, and it could support Massport's contention that the runway will have long-term benefits in reducing delays. Potential commitments or mitigations relating to regional transportation include: C.1 C.2

- improved ground access to Worcester Airport;
- widening Route 3 to the New Hampshire border, to improve access to Manchester Airport;
- unding construction of a rail station at Providence Airport; and
- implementation of the Urban Ring to improve transit access to Logan.

Delay reductions and environmental benefits at airports can arise out of operational changes, as well as physical improvements. Many commenters have focused on Peak Period Pricing (PPP) as a viable alternative to the runway in reducing delays. The analysis in the DEIR suggests that PPP has independent value in reducing delay, which increases long-term as passenger levels increase. In the

FEIR, I am requiring Massport to enhance its PPP study, including a tightly crafted exemption that will protect greatly affected communities from losing connections to the national air network. C.3

- In the FEIR, I am requiring Massport to seek FAA approval for a PPP program as soon as it begins to yield real benefits. C.4

- In the Generic EIR (see below), I am requiring Massport to develop a system of market-based, revenue-neutral landing fees that would reward cleaner planes with lower charges, on the principle that "the polluter pays." C.5

The third major theme that has sounded in this debate is the cumulative impacts of Logan in its entirety. In previous MEPA filings, Massport has made the commitment "to reduce or minimize, wherever practical, the environmental impacts of the operation of Logan Airport as annual passenger volumes rise in the future." The comment letters and the testimony at the public hearings have demonstrated the burden of noise, air pollution, and traffic impacts that neighboring communities will continue to bear as air traffic increases (whether or not Runway 14/32 is built). I believe that the principle of "environmental justice," which so many comments have raised, is largely an expression of this concern.

Massport has argued that the impacts of the airside improvements project are limited because it does not increase the capacity of the airport, or stimulate future demand. I do not fully accept that contention. In the FEIR, I am specifying a series of enforceable short-term and long-term mitigation measures, all intended to make the neighboring communities quieter, cleaner, and less congested. In addition, Massport must address Logan's cumulative impacts in the Generic EIR (GEIR), a separate MEPA document that is fully revised on a five-year cycle, with annual updates. This fall, Massport must submit its latest Annual Update and a proposed scope for the full GEIR revision, to be submitted next summer. I am requiring Massport to treat all comments received on the DEIR as potentially applicable to the GEIR as well. In the FEIR and/or the GEIR, I have required Massport to:

- work with the MBTA to improve transit access to Logan via the Blue Line and the Airport Intermodal Transit Connection (AITC), C.6

- work with the Federal Aviation Administration (FAA) to limit the use of noisier "hush-kitted" aircraft; C.7

- set numerical targets for converting ground service equipment to clean fuels; C.8

- provide more accountability for FAA compliance with the Preferential Runway Advisory System (PRAS) goals, which are intended to distribute aircraft noise more equitably among affected communities; and C.9

- continue to implement and extend its residential soundproofing program, to ensure full access for all residents who are entitled to its benefits. C.10

PURPOSE AND NEED

According to the DEIR, in 1998 Logan ranked 17th in total passengers (26.5 million) and 11th in operations (507,000), but sixth in total delays (143,000 hours). Approximately 47,000 hours of delay were directly attributable to taxiway congestion or northwest wind conditions. Massport has argued that the preferred alternative is intended solely to alleviate those two categories of delays and maximize operational efficiency as passenger levels increase. In other words, the airside projects will accommodate existing and projected demand, not generate additional demand. On the other hand, many commenters clearly see the preferred alternative as an expansion of Logan Airport ("if you build it, they will come" has appeared in numerous letters).

After reviewing the DEIR, I am not convinced that the preferred alternative is purely a capacity neutral airfield enhancement, as stated by Massport. While the maximum "capacity" of the airport will remain at 120 operations per hour with or without the airside improvements, the construction of Runway 14/32 will allow Logan to operate at or near 120 operations per hour for a greater proportion of the year than it currently does. In addition, if delays represent a problem as critical as that presented in the DEIR, there may well be some latent demand generated by the airside project.

I do not, however, believe that developing airport infrastructure automatically creates demand for air service. As noted in previous certificates, the most productive focus of MEPA reviews for Logan projects is not a discussion of whether a project is accommodating or generating demand per se, but rather whether Massport is operating the airport in a manner which minimizes overall environmental impacts in light of its obligations under MEPA.

There are, however, two major issues relating to delays that need further examination. First, the Final EIR should thoroughly explain and justify Massport's delay modeling, as a response to a number of substantive comments. The Final EIR should explain the differences among Massport, the Federal Aviation Administration, and the federal Department of Transportation methods of calculating delays, and discuss any implication for the environmental analysis. Information on delays should be presented in quantitative terms (e.g., average minutes of delay per flight), and compared over time at least since 1993 for Logan and other major U.S. airports. C.11

Secondly, several commenters have questioned Massport's apparent use of 1993, a very delay prone year at Logan, as a base case year. The Final EIR should clarify the base case year used in the delay analysis (and other areas, such as noise and air emissions). If 1993 was indeed the base year, the FEIR should include a "sensitivity analysis" using a more recent year (or average of several recent years) as a baseline, and evaluate the effect on the report's conclusions. C.12

REGIONAL TRANSPORTATION ISSUES

Regional transportation issues have been a focus of many, if not most, of the comment letters. The scope required Massport to study off-site alternatives: specifically, increased use of existing airports and high speed rail. In response, the DEIR includes a detailed discussion of Logan's role in the regional transportation network, which also includes the rapidly growing regional airports in Providence (4.6 million passengers in 1998, up 11%) and Manchester, NH (1.9 million passengers in 1998, up 44%), the currently underused facility at Worcester (only 77,000 passengers in 1998), (footnote 1) and the three-hour high speed rail service to New York slated to begin later this year. It estimates a potential diversion of 7.3 million passengers/year from Logan to regional alternatives (which also include teleconferencing) by the year 2010, based solely on market forces without any additional intervention by Massport or other state transportation agencies. The DEIR diversion analysis suggests that future passenger levels at Logan in the design year 2010 are likely to remain at or below the lower projected level of 37.5 million, rather than attaining the "worst case" 45 million level.

But if the regional airports at Manchester, Worcester, and Providence, taken together, are to play the role of a second major airport for Boston, then Massport and the other state transportation agencies must show that they are doing all they can to ensure the integration of these facilities with Logan as a regional airport system. Massport has recently agreed to operate Worcester Airport, and the Massachusetts Highway Department (MHD) has committed to studying and constructing better roadway access to the airport. EOTC has committed to help fund the construction of a rail station at T.F. Green Airport at Providence, which could provide a fast and convenient link to the new Route 128 Station, currently under construction (EOEA #11099), and to downtown Boston. The planned widening of Route 3 from Route 128 to the New Hampshire border by MHD (EOEA #5668), coupled with the potential for

improved roadway and rail access in New Hampshire, could increase the accessibility and use of Manchester Airport. Finally, the Massachusetts Bay Transportation Authority (MBTA) has planned a series of improvements in transit access to Logan, including the AITC (EOEA #10235), the Blue Line modernization (EOEA #8772), and the Urban Ring.

In response to the high level of public interest and concern over regional transportation issues, the analysis in the FEIR must significantly expand upon that in the DEIR. First, the FEIR must report on the current status of ground access improvements to all four airports proposed by state transportation agencies in Massachusetts or other states (including but not limited to the projects mentioned above), including projected dates for completion of studies and/or construction. Second, the FEIR must quantify the effects of these measures upon projected passenger levels at each of the airports, including Logan. (footnote 2) The projections for ridership on Amtrak's high speed rail, and potential diversions from Logan, should also be updated to reflect the best current information. (footnote 3) C.13 C.14

The DEIR suggests that the 45 million annual passenger level used by Massport in its planning will not occur by the design year 2010. I believe that it is appropriate to continue to study the 45 million passenger scenario, both to assure consistency with previous planning and to analyze a true "worst case" scenario. However, I caution both Massport and reviewers not to focus on the impacts associated with the 45 million passenger scenario, but rather on the impacts of the 37.5 million passenger scenario (assuming that figure is supported by the FEIR analysis). C.15

With renewed focus on diverting passengers from Logan, it is more important than ever that we understand the environmental impacts of increased use of regional airports. DEP has commented that a regional environmental assessment of airport infrastructure would prove useful in determining whether increased use of the regional airports actually minimizes impacts, and the letter from the Conservation Law Foundation lays out a potential framework for a project-specific regional analysis of transportation alternatives in the context of the airside project review. (My predecessor as Secretary also suggested such a regional study in the Certificate on the last GEIR.) The FEIR must try to evaluate the environmental impacts of these improvements on a regional, as well as a local basis.

C.16

I acknowledge certain difficulties in presenting the cumulative environmental impacts of physically unrelated projects. Because Manchester and Providence airports are in other states, and because the proposed ground access improvements at Worcester are at such a preliminary stage, I am not requiring Massport to perform independent EIR level review of local impacts at those facilities. Rather, Massport should rely upon existing reports to summarize information on the predicted levels of environmental impacts (such as noise contours, air emissions, vehicle miles traveled, and impacts on wetlands and other critical resources) caused by the physical improvements and predicted passenger levels. I also acknowledge that the inclusion of any project as part of this analysis, regardless of its apparent benefits, will not remove the necessity of independent MEPA review if required by statute and regulation.

Many commenters have urged the study of a new second major airport as an alternative to this project. The scope did not require this analysis, and I am not reopening that issue in the context of the airside project review. Many comments have also suggested that commercial service at Hanscom Field in Bedford should be considered as a project alternative. Massport argues that commercial service at Hanscom is not likely to constitute a feasible alternative to Logan in the foreseeable future, and that Hanscom is better suited to remain the region's principal general aviation (GA) airport. (In 1998, there were approximately 183,000 GA operations at Hanscom, compared with 31,000 at Logan.) To back up Massport's contention, the Final EIR should address in qualitative terms the environmental impacts of commercial service at Hanscom; opportunities to divert an even higher share of Logan's GA operations to Hanscom and other regional airports; and any legal impediments to such measures. Finally, New Bedford Airport has been suggested as a reliever airport for cargo traffic. Massport should report upon the status of MEPA review for the proposed expansion of New Bedford Airport (EOEA #10316), which had previously involved the filling of an unprecedented area (over 40 acres) of protected wetlands. C.17 C.18 C.19

The Proposed Section 61 Findings must detail specific steps to be taken by Massport and other state transportation agencies, to ensure that Worcester, Manchester, and Providence airports, together with Logan, will operate jointly as the key elements in an efficient and environmentally balanced regional air network. C.20

PEAK PERIOD PRICING

Of all the elements under consideration as part of the airside program, the only one not contained in the preferred alternative is Peak Period Pricing (PPP): the imposition of a landing fee surcharge, irrespective of aircraft weight, during the peak hours of 2 PM to 8 PM. This kind of financial disincentive can reduce delays by modifying airline scheduling behavior. The PPP proposal derives indirectly from the PACE program, Massport's 1988 imposition of landing fee incentives to prevent delays, which was ultimately overturned in a court decision as contravening Federal laws protecting interstate commerce. I have received many comments from the airline industry and from groups in small markets (notably the Cape and Islands, and northern New England) voicing strong opposition to Peak Period Pricing, even as most of these letters have supported the other airside projects. Conversely, I have received many comments arguing that PPP alone, without Runway 14/32, should be the preferred alternative for solving the delay problems.

The analysis in the DEIR appears to show that under slower growth scenarios (37.5 million passengers, low fleet), Runway 14/32 yields the greatest delay benefits, with a smaller benefit accruing to PPP. As annual operations increase further (37.5 million, high fleet, and 45 million), implementing PPP leads to greater delay reduction benefits equaling or exceeding those of Runway 14/32. The DEIR analysis also shows that at all levels of growth, the combination of Runway 14/32 and PPP produce the greatest delay benefits. I also note that by reducing taxiway delays, PPP helps reduce air pollution and noise.

I understand the concern of small and relatively remote areas regarding the effects of PPP on access to Logan and points beyond. The DEIR appendices document the negative economic impacts of the proposed PPP program on certain areas. However, I find that the DEIR has not provided enough information to discount PPP as a legitimate (and perhaps even necessary) part of the environmental mitigation associated with any airside improvements.

The Final EIR must include a much more refined analysis of Peak Period Pricing, including a full evaluation of positive and negative (footnote 4) environmental impacts. I am concerned that the DEIR analysis applies only a single price formula to operations, and that it assumes that the response to PPP will be either a cancellation of flights or moving "shoulder" flights out of the time period subject to PPP. The analysis should account for potential alterations in flight mix resulting from PPP (i.e., the possibility of flight consolidation to Logan or diversion to other airports), and it should draw upon past PPP analysis, such as the PACE program and the 1993 Strategic Assessment Report. Most importantly, the Final EIR should re-analyze the delay effects of a PPP program that contains a tightly crafted exemption for greatly affected communities, to ensure that they do not lose access, through Logan or other regional airports, to the national air network. C.21

In the Final EIR and the Proposed Section 61 Finding, Massport should commit to regular monitoring of peak-period airline schedules and delays, to be reported in the Generic EIR and its Annual Updates. The Final EIR must also define appropriate conditions at which Massport will begin seeking the necessary federal and state regulatory processes, in order to implement a properly structured PPP program. C.22 C.23

CUMULATIVE IMPACTS AND THE GEIR

I have received numerous comments suggesting that the review of the airside projects has been improperly segmented under MEPA (and NEPA) from the review of airport operations as a whole. The issue of cumulative impacts and segmentation is not new to the review of projects at Logan Airport. As stated in past Certificates, the Generic EIR (EOEA #3247/5146) is expected to provide a "big picture" cumulative analysis of Logan operations, impacts, and mitigation. It complements the project-specific EIR for the airside projects, helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport.

The 1998 Annual Update to the GEIR will undergo MEPA review later this year. The Annual Update will include a Proposed Scope for the 1999 Logan Airport GEIR. The issues that Massport will address in the 1999 GEIR will overlap to a considerable extent with many of the issues highlighted in this Certificate. As a result, I do not see the need to duplicate the GEIR within the context of the airside EIR review. (I note that the federal review process does not include the formal equivalent of the GEIR, so my comments regarding segmentation are necessarily limited only to the state review process.)

Nonetheless, I emphatically agree that the airside DEIR cannot be viewed in isolation from airport operations and impacts as a whole. The GEIR does not replace the project-specific EIR, nor does it relieve Massport of its obligations under MEPA for project specific analysis of impacts and mitigation. Massport's fundamental environmental commitment, as expressed in the 1994/95 GEIR, is to "reduce or minimize, wherever practical, the environmental impacts of the operation of Logan Airport as annual passenger volumes rise in the future." The requirements laid out in this Certificate will require Massport to address certain cumulative impacts within the context of the project-specific airside Final EIR and in the Section 61 Findings, as detailed below.

ENVIRONMENTAL JUSTICE

Many of the comments received have raised the issue of "environmental justice," as defined under Federal Executive Order 12898 and associated guidance materials. Because in the past the legitimate environmental interests of low income and minority areas too often have "flown under the radar" of the environmental review process, application of the principles of environmental justice is intended to ensure that low income and minority populations are accorded the same standard that applies to those in other areas. Under E.O. 12898, Massport must fully analyze the environmental impacts of its proposed actions on low income and minority populations; show that it has avoided, minimized, or mitigated these impacts to the greatest feasible extent; and ensure that its proposed actions do not unduly burden low income or minority areas. To assess whether Massport has adequately analyzed the issue for purposes of MEPA review, the Final EIR should include more detailed demographic data on the affected populations in both tabular and graphic form, analysis of the full range of impacts (including noise impacts within the 60 dB contour), a comparison of the affected population with that of Boston and the other affected municipalities, and a discussion of the community participation process used in preparing the Draft and Final EIRs. C.24

Many of the comments have used the term "environmental justice" more broadly. Rather than focusing on the legal definition of disproportionate impacts to low income or minority populations, such comments question whether neighborhoods in Boston and adjacent communities should bear the brunt of impacts from the region's air travel when many of the people using Logan live outside of Route 128. The comment letters and the testimony at the public hearings have demonstrated the burden of cumulative noise, air pollution, and traffic impacts that neighboring communities will continue to bear as air traffic increases (whether or not Runway 14/32 is built). This broader principle of fairness, and a concern with the cumulative impacts of airport operations, has informed my decisions throughout this Certificate. Therefore, in addition to requiring the further analysis that will satisfy the Executive Order, I have focused on concrete mitigation measures in the FEIR and the GEIR that will maintain or reduce the existing envelope of cumulative environmental impacts from airport operations.

NOISE

No other single issue so dominates the comment letters as the issue of aircraft noise, which has united a diverse cross section of the metropolitan area. The impassioned oral testimony at the public hearings drove home the point that aircraft noise profoundly affects the lives of the people who live underneath flight paths. Article 49 of the Massachusetts Constitution enshrines a right to freedom from "excessive and unnecessary noise." The time has come to address the issue of airport noise clearly and definitively. I am convinced that simply soundproofing the most affected residences and completing the phase-in of quieter Stage 3 aircraft, which is required under Federal law by the end of 1999, cannot be the final answers to the issue of noise mitigation. C.25

The DEIR includes a detailed assessment of the noise impacts of the proposed Runway 14/32 and the other airside projects. The net result of Massport's preferred alternative is to reduce dramatically the number of people modeled to be exposed to the highest (>70 dB DNL) levels of noise. At the same time, the project is projected to produce a relatively small increase in the number of people exposed to noise in the 65-70 dB DNL range, and a somewhat larger increase in the 60-65 dB DNL range. Although not expressly quantified in the DEIR, the implementation of the preferred alternative also redistributes the exposed population. It appears that up to 40% of the people within the 65-70 dB contour will be newly included, while an equal number of people will fall into lower contours. A similar pattern exists for the 60-65 dB contour. The Final EIR should quantify the number of "new" people within each noise contour under the preferred alternative. It should also present information on the 60-65 dB noise contour within the text, and not just in the appendices. C.26

Previous certificates on the GEIR have dwelled at length about the issues of noise impacts and mitigation. At the core of the noise abatement policy stands the commitment in the 1994/95 GEIR to "minimizing nighttime noise and to addressing and responding to noise issues and complaints." Given the extremely high level of concern expressed with noise impacts from Logan in general and from Massport's preferred alternative in particular, it is time to turn these general policy goals into specific noise mitigation commitments. C.27

Soundproofing.

Many comments have pointed out the limitations of residential acoustical treatment (the "soundproofing" program), which only works indoors with closed windows. While I recognize these limitations, the program is and will continue to be an important part of Massport's noise mitigation commitments. The Final EIR and the Proposed Section 61 Finding should contain feasible implementation measures to ensure full access to the soundproofing program for all residents who are entitled to its benefits. C.28

Massport uses the federal criteria of residing within a 65 dB DNL contour for determining soundproofing eligibility. As EPA points out, the modeled noise contours do not exactly match the measured field values, and they appear to somewhat underestimate Day-Night Levels (DNL) of sound. Moreover, as anyone who has ever lived under a flight path can attest, noise from aircraft overflights can create significant environmental impacts even for those who reside outside the 65 dB contour. From the data in the technical appendix, it is clear that thousands of residents are and will be exposed to noise just below 65 dB DNL as a result of airport operations. (A primary purpose of requiring information on the 60 dB noise contour was to document which areas might fall within a zone defined by an appropriate "margin of error" for noise modeling.) Given the number of people who are potentially ineligible for soundproofing because of modeling limitations, in the Final EIR Massport should examine further refinements to its contours that would ensure full access to soundproofing for all affected residents. Also in the Final EIR, Massport must commit to providing soundproofing for all residents currently within the C.29

65 dB contour, even if they would otherwise lose their eligibility as a result of this project.

C.30

The soundproofing program requires that structures within the 65 dB DNL contour meet certain code requirements prior to receiving acoustical treatments. I am concerned that the residences most in need of soundproofing will be in low income areas with relatively high proportions of sub-standard housing. The Final EIR should explain how often such circumstances have occurred in the past. If some (presumably low income) residents are likely to be denied noise mitigation on this grounds, the FEIR and the Proposed Section 61 Finding should consider financial or other programs to ensure equal access to noise mitigation.

Compliance with PRAS Goals

C.31

The Preferential Runway Advisory System (PRAS) goals, initially developed in the 1970s, is a set of voluntary targets for FAA runway assignments, aimed at ensuring a more equitable regional distribution of aircraft noise among all affected communities. The DEIR demonstrates that the implementation of the preferred alternative will significantly improve compliance with PRAS goals. From the discussion it is not clear, however, if compliance with the PRAS goals represent maximum feasible mitigation under MEPA. I note that the PRAS program predates MEPA review of Logan Airport, and the modern focus on environmental justice issues. I am also concerned that changes in land use patterns and residential densities may have altered the validity of the assumptions under which the PRAS program was developed. Although I am not convinced that a wholesale revamping of the PRAS program is appropriate (nor has the CAC suggested that step), the Final EIR should discuss whether any updates of the PRAS goals are contemplated, and detail any mechanisms for ensuring that the program fulfills its objective of creating an equitable noise distribution.

C.32

Several commenters have questioned the level of FAA's adherence to PRAS goals in the past. Massport must show in the FEIR that its prediction of the future effects of the PRAS goals do not over-estimate FAA's ability and willingness to implement them, as based on past experience. In addition, the FEIR and the Proposed Section 61 Finding must include protocols for monitoring adherence to the PRAS goals, and periodic disclosure of the monitoring results (I suggest quarterly reports to the CAC, plus annual statements in the GEIR update).

C.33

C.34

Upon implementation of the preferred alternative, Runway 27 is projected to see an increase in use, potentially leading to further increases in aircraft overflights over portions of Roxbury, Jamaica Plain, and Brookline. From the comments received, it appears that the compliance with the new flight procedures has been incomplete. It also appears that the new Runway 27 corridor tends to narrow the geographical area of overflights, thus concentrating noise in certain areas. The Final EIR should discuss the relationship between the airside program and the recently-completed Runway 27 EIS, (footnote 5) describe any cumulative impacts on the corridor, and analyze the consistency of the noise impacts with the PRAS goals.

Restricting Night-time Flights and Hush-kitted Aircraft.

In the near term, the phasing out of stage 2 aircraft by the end of 1999 will produce a decline in the total annual noise produced by Logan aircraft. In the longer term, however, both total annual noise and night-time noise are projected to increase as the number of flights in an all Stage 3 fleet rises. Moreover, many of the aircraft currently operating at Logan are actually stage 2 aircraft that have received mechanical alterations ("hush-kits") to meet the minimum requirements for stage 3 aircraft. These planes are significantly noisier than new aircraft specifically designed to meet stage 3 requirements.

As an initial step, I note that the PRAS goals seek to route all night-time flights over the water between 12 PM and 6 AM. In the FEIR, Massport should report on the feasibility of extending this preferential night-time period to the hours of 10 PM to 7 AM, and the effect of this change on noise levels and contours. C.35

Federal law allows the Federal Aviation Administration (FAA) to grant a waiver (under FAR Part 161) to an airport operator to restrict the number or schedule of Stage 3 aircraft. Massport should begin discussions now with FAA, with the goal of instituting restrictions, either locally or nationally, on hush-kitted stage 3 aircraft. The GEIR should report on the status of those consultations and discuss the specific types of information needed to pursue a Part 161 waiver. Since developing limitations on Stage 3 operations will necessarily involve the federal government, I urge the members of the Congressional delegation to help pursue this issue further with FAA. C.36

AIR QUALITY

The DEIR argues that the preferred alternative will lead to air quality improvements by increasing the operating efficiency of the airport, thereby better accommodating existing demand. (footnote 6) As stated above, I am not convinced that Massport's preferred alternative is capacity neutral, although I disagree with those commenters who have suggested that the addition of a sixth runway will be the primary factor in drawing additional air traffic to Logan Airport.

Even accepting Massport's arguments about the air quality benefits of its preferred alternative, the airside project raises issues of cumulative air quality that Massport must address. Logan Airport currently ranks as the sixth largest source of NO_x emissions in the Commonwealth, and by 2010 it is likely to become one of the three largest such sources. Currently, aircraft emissions are the only mobile air pollution sources included in the State Implementation Plan (SIP) emissions inventory that are not slated for meaningful near- or long-term emissions reductions. Nationally, pollution emissions from aircraft and airports represent the largest uncontrolled sources of air pollution. NO_x is an ozone precursor. Although Eastern Massachusetts has fared well in meeting one-hour standards for ozone over the past few years, recently there were 65 exceedences of the more stringent 8-hour standard adopted by the federal Environmental Protection Agency (EPA), over 12 days, at 14 different monitoring stations. It is quite likely that additional emissions reduction beyond those already in the SIP will prove necessary for Massachusetts to meet the 8-hour standard.

As previous certificates have stressed, it is the total air pollution from the airport -- whether from planes, the ground fleet servicing these aircraft, or the vehicles carrying passengers and employees -- which requires mitigation. Previous GEIRs have done a thorough job of documenting emissions from Logan Airport and in predicting trends based on various passenger level forecasts. Now it is time to implement the broad goal of maintaining or reducing Logan's overall environmental impacts, even as annual passenger volumes rise in the future. C.37

To make this commitment more effective, in the GEIR Massport must examine the feasibility of a system of market-based, revenue-neutral landing fees that reward cleaner planes with lower charges, on the principle that "the polluter pays." Airports in Europe, notably Zurich, are beginning to institute programs of this kind. In the GEIR, I am directing Massport to develop and model a system of emissions-based landing fees. If it is effective, practicable, and consistent with Federal law, then Massport will begin the necessary regulatory process for implementing the program by a date certain, to be defined in the GEIR scope. As an initial step toward reducing emissions, Massport should set numerical annual targets in the GEIR for the conversion of its tenants' ground service equipment to clean fuels, and for providing electric power to aircraft at all gates. C.38

GROUND TRANSPORTATION

Numerous comments argue that the DEIR should have included a detailed analysis of ground transportation issues, because of the cumulative impacts of landside and airside operations at Logan Airport. The issue of ground transportation is clearly relevant to any discussion of cumulative impacts, and is an important component of any cumulative air quality analysis. However, the GEIR includes a substantial body of analysis on ground transportation issues, and the Section 61 Finding for the West Garage project includes enforceable commitments for ground transportation mitigation. Because Massport is dealing with this issue in other documents, I will not require a detailed analysis of Massport's ground transportation strategy within the Final EIR, but rather focus on the following issues.

One of the cornerstones of Massport's ground access strategy is a commitment to a 35.2% mode share for High Occupancy Vehicles (HOV) when passenger volumes reach 37.5 million annually. As previous certificates have pointed out on numerous occasions, although this goal translates into an increase in HOV mode shares from the present, it also represents a substantial increase in the absolute number of non-HOV trips to the airport, due to the large increase in total number of passengers. Massport has not shown how these non-HOV trips will be accommodated under the parking freeze. C.39

Massport should consider a higher target percentage for HOV at 37.5 million annual passengers, and discuss the issue in the GEIR. Massport should also consider enforcement mechanisms for whatever HOV percentage emerges (for example, committing to set aside a sliding scale of funding for HOV/transit promotion and improvements if HOV goals do not reach the levels to which Massport has committed). In the GEIR, Massport should also consider the consolidation of rental car lots and the courtesy vehicles serving them. I understand that this form of air quality mitigation is in practice at other airports in the United States. C.40 C.41

Finally, the Final EIR and the analysis in the next GEIR should reflect proposed MBTA improvements in transit access to Logan, including the AITC, the Blue Line modernization, and the Urban Ring. In particular, the Urban Ring project, shortly scheduled to conclude its major investment study and begin MEPA review, promises not only to improve transit access to Logan, but also to enhance mobility, economic development, and the quality of life in many of the communities most affected by the airport -- East Boston, South Boston, Roxbury, Cambridge, Somerville, Everett, and Chelsea. C.42

UNIDIRECTIONALITY OF RUNWAY 14/32

C.43

The DEIR analyzes only the environmental impacts of a unidirectional Runway 14/32, with both take offs and landings following an easterly flight path largely over water. Any proposal to use the runway in a bidirectional manner would need additional MEPA review, including the scoping, preparation, and review of an entirely new EIR document. Ever since the Airside Improvements project was first proposed, Massport has publicly committed to keeping Runway 14/32 as a unidirectional runway. The Proposed Section 61 Findings in the Final EIR should include this enforceable commitment to unidirectionality. The Final EIR should also document any other legal or administrative processes, or any operational or environmental constraints, that can assure unidirectionality. In particular, Massport should detail how the modified court injunction can assure unidirectional use of Runway 14/32, how any FAA regulations may affect use of the runway, and whether any physical constraints (e.g., the Hyatt Hotel) would preclude or restrict the possible bidirectional use of Runway 14/32. C.44

CONSTRUCTION PERIOD

C.45

The Final EIR should include a detailed construction management plan that quantifies the number of daily and total truck trips. The Final EIR should also address the cumulative impacts of those

C.46

construction activities for the airside projects occurring simultaneously with Central Artery/Tunnel construction in East Boston, other projects at Logan Airport, and any other major construction activities planned to occur in East Boston. The Final EIR should also disclose the full impacts of any nighttime construction, and include an analysis of nighttime construction noise in residential areas potentially affected. C.47

The Final EIR and the GEIR should also discuss the feasibility of Massport's participation in the Clean Air Construction Initiative, both with respect to this project and other construction projects at the airport. This program involves retrofitting existing heavy construction equipment with emissions control technology. (The Central Artery/Tunnel project is already participating in this program, and the Department of Environmental Protection is actively discussing an expansion of the program with several other public agencies.) The Proposed Section 61 Findings should include appropriate commitments for construction period mitigation, in particular for the traffic, air quality, and noise impacts discussed above. C.48

Massport's preferred alternative involves a substantial amount of soil excavation. The Department of Environmental Protection has raised several issues regarding excavate classification and management, to which the Final EIR should respond in detail. C.49

OPEN SPACE/PARKLAND

The Boston area is fortunate to have large areas of open space, such as the Emerald Necklace, Arnold Arboretum, Franklin Park, and the Harbor Islands, that provide a refuge from busy urban life. Noise from passing aircraft can clearly impact the quality of these open spaces, and reduce their value for recreation or quiet contemplation. Although the legislation that created the Harbor Islands National Recreation Area relieved Massport and the FAA of Federal section 4(f) requirements for this project, it did not exempt impacts on the Harbor Islands from environmental review under MEPA. The Final EIR should analyze the environmental impacts of the airside projects (including cumulative impacts with other airport operations) on the Harbor Islands, Arnold Arboretum, Franklin Park, and the Emerald Necklace. I understand the desire to direct flight corridors over the least densely populated areas, and recognize that in the final analysis, such policies may be justifiable. However, that analysis must take place, to fully evaluate impacts and develop maximum feasible mitigation. C.50

RARE SPECIES

Massport's preferred alternative will impact the nesting and feeding habitat of the state endangered Upland Sandpiper (*Bartramia longicauda*) and will constitute the "taking" of a state-protected species under the Massachusetts Endangered Species Act. The DEIR commits to both on-site and off-site mitigation for rare species impacts. The discussion of on-site mitigation in the DEIR is generally adequate. However, the Final EIR should provide greater detail on the proposed off-site mitigation, including the specifics of the habitat restoration proposed at the Massachusetts Military Reservation. The Final EIR should also include sufficient information for the Natural Heritage Program to evaluate the merits of a Conservation Permit. The Proposed Section 61 Finding should include all on-site and off-site mitigation for impacts to rare species. C.51

NOTICE OF PROJECT CHANGE

At the time the DEIR was filed, Massport also filed a Notice of Project Change, based upon the three-year lapse in time since the filing of the ENF, and it requested a determination that no further review was required for the change. I deferred a decision on this request until the conclusion of the DEIR review period. Several commenters have argued that a Supplemental DEIR should be required based solely upon the lapse of time. I find, however, after considering the documents and the comments in light of the factors set forth in Section 11.10(6) of the MEPA Regulations, that any issues arising out

of the lapse of time can be adequately addressed in the FEIR or the GEIR, as the case may be.

SECTION 61 FINDINGS

C.52

The Final EIR should include Proposed Section 61 Findings for each area of impact associated with Massport's preferred alternative. I remind Massport of the importance of the Section 61 Findings as a mechanism for formalizing the mitigation commitments that emerge from the EIR process, and I expect that the Section 61 Findings will commit to appropriate mitigation.

COMMENTS

C.53

The Final EIR should include a copy of this Certificate and copies of all comments received, and it should respond to all substantive comments received. In particular, I wish to highlight the comments received from the United States Environmental Protection Agency, the Massachusetts Department of Environmental Protection, the Community Advisory Committee to Massport (and individual CAC members), the Conservation Law Foundation, the various New England state transportation agencies, the City of Boston Environmental Services Division, the La Salle Partnership, and the letters received from elected public officials. Together, these comment letters summarize most of the major substantive environmental issues raised by opponents, proponents, and neutral reviewers.

CIRCULATION

C.54

For those who submitted form letters for which addresses are available, Massport should send a Notice of Availability of the Final EIR and include information on comment deadlines and the time-sensitive nature of the review process. For those who submitted individual comment letters, Massport should circulate an Executive Summary of the Final EIR. The Executive Summary should include a cover letter with information on comment deadlines (including the time-sensitive nature of the documents under review), and information on where to obtain a full copy of the Final EIR. Massport should circulate the full Final EIR to its standard distribution list of agencies and community groups, as well as any additional parties specified in Section 11.16 of the MEPA regulations. Massport should Circulate a full copy of the Final EIR to the municipal libraries (including branch libraries) of Boston, Winthrop, Everett, Revere, Nahant, Malden, Medford, Melrose, Somerville, Cambridge, Chelsea, Brookline, Dedham, Milton, Quincy, Braintree, Weymouth, Hingham, Hull, Provincetown, Edgartown, and Nantucket. Massport should promptly furnish a full copy of the EIR to any party who requests a copy.

FOOTNOTES

- **Footnote 1.** The DEIR reports passenger emplanements in Table 2 4-1. These are only 50% of total passengers.
- **Footnote 2.** I suggest that the estimated impacts of teleconferencing should be discounted in this analysis, unless Massport can make a compelling case why this would affect Logan differently from other regional airports.
- **Footnote 3.** I also note the importance of maintaining South Station as the gateway to Amtrak's high speed rail link to New York, while the City of Boston pursues air rights development over the tracks. The EIR currently being prepared for that project (EOEA #9131) must contain a detailed construction mitigation program to ensure the smooth functioning of the station.
- **Footnote 4.** I note the potential for increased reliance on early morning and late evening flights as one potentially negative impact from PPP.
- **Footnote 5.** The review of the Runway 27 flight path was conducted at the federal level only.
- **Footnote 6.** The comment from the Environmental Protection Agency (among others) has raised several concerns with the assumptions used in the air quality analysis. The Final EIR should address these fully, to justify the conclusion that Massport's preferred alternative is associated with the lowest level of air quality impacts.

Dated: May 7, 1999

Certificate of the Secretary of Environmental Affairs on the Logan Airside Improvements Planning Project Draft EIR

Code	Topic 1	Topic 2	Comment	Response
C.1	Regional Transportation	Regional Airports	Although I strongly agree on the importance of the regional transportation network, I disagree with the contention that Massport's treatment of this subject in the DEIR has been insufficient. The scope issued by then-Secretary Coxe in 1995 did not require the study of a new second airport, and I am not reopening that issue in the context of this review.	Comment noted.
C.2	Regional Transportation	Regional Airports	The DEIR suggests that the existing airports at Worcester, Manchester, and Providence, seen together, may serve as Boston's "second airport." In the Final EIR, Massport must study the planned improvements at those airports in greater detail, to show the effects upon passenger traffic at Logan...Potential commitments or mitigation relating to regional transportation include: ■ improved ground access to Worcester Airport; ■ widening Route 3 to the New Hampshire border, to improve access to Manchester Airport; ■ funding construction of a rail station at Providence Airport; and ■ implementation of the Urban Ring to improve transit access to Logan.	An expanded and updated discussion of the regional alternatives is presented in Chapter 2 of the Supplemental DEIS/FEIR. Massport supports all the planned improvement projects that will enhance the attractiveness of the regional airports as alternatives to Logan Airport. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a description of the upcoming New England Airports System Study.
C.3	Alternatives	Peak Period Pricing	...I am requiring Massport to enhance its PPP study, including a tightly crafted exemption that will protect greatly affected communities from losing connections to the national air network.	Refer to Section 4.5 of the Supplemental DEIS/FEIR for an expanded discussion of PPP. An exemption program designed to protect services to small communities most reliant on Boston for access to the national air transport system is described in Section 4.5.3 of the Supplemental DEIS/FEIR. The section provides an illustrative exemption program and its impact on the delay reduction potential of PPP.
C.4	Alternatives	Peak Period Pricing	I am requiring Massport to seek FAA approval for a PPP program as soon as it begins to yield real benefits.	Massport will take all steps necessary to implement PPP with an appropriate exemption program when such a program is appropriate. No formall FAA approval of PPP is required. Also, refer to response to Comment C.21.
C.5	Air Quality	Emission-Based Landing Fees	In the Generic EIR (see below), I am requiring Massport to develop a system of market-based, revenue-neutral landing fees that would reward cleaner planes with lower charges on the principle that "the polluter pays."	The EOEA May 7, 1999 Certificate on the Airside Project Draft EIS/EIR requested that Massport undertake a feasibility study of implementing measures to reduce Nox emissions at Logan. This study is currently underway and will be presented to MEPA by the end of March 2001.
C.6	Ground Transportation	Access To Logan	In the FEIR and/or the GEIR, I have required Massport to work with the MBTA to improve transit access to Logan via the Blue Line and the Airport Intermodal Transit Connection (AITC);	Massport is working with the MBTA to improve transit access to Logan Airport via the Blue Line and the Airport Intermodal Transit Connector (AITC). Section 2.7 of the Supplemental DEIS/FEIR discusses the proposed MBTA improvements in transit access to Logan Airport. The *Logan Airport 1999 ESPR* (previously GEIR), reports on the status of these ground transit improvement projects.

Code	Topic 1	Topic 2	Comment	Response
C.7	Noise	Hushkitted Aircraft	In the FEIR and/or the GEIR, I have required Massport to work with the Federal Aviation Administration (FAA) to limit the use of noisier "hush-kitted" aircraft;	Massport's initial efforts have been to focus discussion with Logan Airport carriers to encourage substitution of full Stage 3 certified aircraft for hushkitted aircraft where feasible. Both the Supplemental DEIS/FEIR and the *Logan Airport 1999 ESPR* (previously GEIR) discuss the status of and potential for reducing the use of hushkitted Stage 3 aircraft. Refer to Section 8.4 of the Supplemental DEIS/FEIR.
C.8	Air Quality	Alternative Fuels	In the FEIR and/or the GEIR, I have required Massport to set numerical targets for converting ground service equipment to clean fuels;	The *Logan Airport 1999 ESPR* (previously GEIR) reports on Massport's Alternative Fuels Vehicle program and on Massport's efforts to encourage the use of alternative fuel vehicles.
C.9	Noise	PRAS	In the FEIR and/or the GEIR, I have required Massport to provide more accountability for FAA compliance with the Preferential Runway Advisory System (PRAS) goals, which are intended to distribute aircraft noise more equitably among affected communities.	Massport has developed PRAS goals to which the FAA attempts to achieve given weather and safety conditions. Section 4.3 of the Supplemental DEIS/FEIR provides an evaluation of existing measures for monitoring PRAS achievement and demonstrates that the FAA has improved its performance relative to the PRAS goals. The Preferred Alternative mitigation program includes additional reporting requirements recommended to enhance the Massport monitoring effort.
C.10	Noise	Soundproofing	In the FEIR and/or the GEIR, I have required Massport to continue to implement and extend its residential soundproofing program, to ensure full access for all residents who are entitled to its benefits.	Section 8.5 of the Supplemental DEIS/FEIR describes the sound insulation proposed for the affected residences that fall within the 65 dB DNL contour for the Preferred Alternative as defined by the 29M Low Fleet scenario. Massport reported on progress on its existing sound insulation program in the *Logan Airport 1999 ESPR* (previously GEIR). In addition sound insulation will be provided for affected residences impacted by the Preferred Alternative as discussed in Section 6.8 of the Supplemental DEIS/FEIR.
C.11	Delay	Model	...[T]he Final EIR should thoroughly explain and justify Massport's delay modeling, as a response to a number of substantive comments. The Final EIR should explain the differences among Massport, the Federal Aviation Administration, and the Federal Department of Transportation methods of calculating delays, and discuss any implication for the environmental analysis. Information on delays should be presented in quantitative terms (e.g., average minutes of delay per flight), and compared over time at least since 1993 for Logan and other major U.S. airports.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports.
C.12	Delay	Model	...The Final EIR should clarify the base case year used in the delay analysis (and other areas, such as noise and air emissions). If 1993 was indeed the base year, the FEIR should include a "sensitivity analysis" using a more recent year (or average of several recent years) as a baseline, and evaluate the effect on the report's conclusions.	Using 1993 had the benefit of representing a worst case scenario for both noise impacts and delays due to over-scheduling. The Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. The No Action Alternative is the appropriate "base" comparison for assessing future year conditions and the effectiveness of the Airside Project. The Supplemental DEIS/FEIR expands upon the discussion between current and historical conditions and can be found in Section 4.2 of the Supplemental DEIS/FEIR.
C.13	Regional Transportation	Regional Airports	...[T]he FEIR must report on the current status of ground access improvements to all four airports proposed by state transportation agencies in Massachusetts or other states ... including projected dates for completion of studies and/or construction.	Chapter 2 of the Supplemental DEIS/FEIR discusses the impact of planned ground access improvement projects at Logan Airport and the regional airports on passenger traffic levels and high-speed rail passenger diversion estimates.

Code	Topic 1	Topic 2	Comment	Response
C.14	Regional Transportation	Regional Airports	...[T]he FEIR must quantify the effects of these measures upon projected passenger levels at each of the airports, including Logan. The projections for ridership on Amtrak's high-speed rail, and potential diversions from Logan, should also be updated to reflect the best current information.	Section 2.8 of the Supplemental DEIS/FEIR discusses passenger and activity growth at the regional airports and their effect on Logan Airport's projected passenger and activity levels. With regard to ridership projections on Amtrak's high-speed rail, the Airside Project Draft EIS/EIR described in detail the best current information. No updated projections are available. Refer to Appendix B of the Supplemental DEIS/FEIR for Amtrak's letter stating that no revised ridership estimates are available.
C.15	Regional Transportation	Regional Airports	...I caution both Massport and reviewers not to focus on the impacts associated with the 45 million passenger scenario, but rather on the impacts of the 37.5 million passenger scenario	Extensive analysis of impacts of the 37.5 million scenario is discussed in detail in Chapters 5 and 6 of the Supplemental DEIS/FEIR.
C.16	Regional Transportation	Regional Airports	...[I]t is more important than ever that we understand the environmental impacts of increased use of regional airports...The FEIR must try to evaluate the environmental impacts of these improvements on a regional, as well as a local basis...Because Manchester and Providence airports are in other states, and because the proposed ground access improvements at Worcester are at such a preliminary stage, I am not requiring Massport to perform independent EIR level review of local impacts at those facilities. Rather, Massport should rely upon existing reports to summarize information on the predicted levels of environmental impacts (such as noise contours, air emissions, vehicle miles traveled, and impacts on wetlands and other critical resources) caused by the physical improvements and predicted passenger levels...	Appendix B of the Supplemental DEIS/FEIR describes available environmental documents for the regional airports (T.F. Green/Providence, Manchester, Worcester Regional and Hanscom Field airports) and summarizes predicted levels of environmental impacts of proposed improvement projects and forecast activity levels.
C.17	Regional Transportation	Regional Airports	Many commenters have urged the study of a new second major airport as an alternative to this project. The scope did not require this analysis, and I am not reopening that issue in the context of the airside project review.	Comment noted.

Code	Topic 1	Topic 2	Comment	Response
C.18	Regional Transportation	Regional Airports	Many comments have also suggested that commercial service at Hanscom Field in Bedford should be considered as a project alternative. Massport argues that commercial service at Hanscom is not likely to constitute a feasible alternative to Logan in the foreseeable future...[T]o back up Massport's contention, the Final EIR should address in qualitative terms the environmental impacts of commercial service at Hanscom; opportunities to divert an even higher share of Logan's GA operations to Hanscom and other regional airports and any legal impediments to such measures.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.
C.19	Regional Transportation	Regional Airports	New Bedford Airport has been suggested as a reliever airport for cargo traffic. Massport should report upon the status of MEPA review for the proposed expansion of New Bedford Airport (EOEA #10316), which had previously involved the filling of an unprecedented area (over 40 acres) of protected wetlands.	Massport reports on the status of the New Bedford Airport Project in Section 2.6 of the Supplemental DEIS/FEIR.
C.20	Regional Transportation	Regional Airports	The Proposed Section 61 Findings must detail specific steps to be taken by Massport and other state transportation agencies, to ensure that Worcester, Manchester, and Providence airports, together with Logan, will operate jointly as the key elements in an efficient and environmentally balanced regional air network.	Refer to Chapter 2 of the Supplemental DEIS/FEIR. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
C.21	Alternatives	Peak Period Pricing	I find that the DEIR has not provided enough information to discount PPP as a legitimate (and perhaps even necessary) part of the environmental mitigation associated with any airside improvements. The Final EIR must include a much more refined analysis of Peak Period Pricing, including a full evaluation of positive and negative environmental impacts... The analysis should account for potential alterations in flight mix resulting from PPP (*i.e.*, the possibility of flight consolidation to Logan or diversion to other airports), and it should draw upon past PPP analysis, such as the PACE program and the 1993 Strategic Assessment Report. Most importantly, the Final EIR should re-analyze the delay effects of a PPP program that contains a tightly crafted exemption for greatly affected communities, to ensure that they do not lose access, through Logan or other regional airports, to the national air network.	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. In the current environment, airline over-scheduling is not a significant contributor to Logan Airport delays and, therefore, PPP was not recommended for immediate implementation. In addition, PPP imposes significant costs on regional airlines and is expected to restrict access to certain markets. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program.

Code	Topic 1	Topic 2	Comment	Response
C.22	Alternatives	Peak Period Pricing	In the Final EIR and the Proposed Section 61 Findings, Massport should commit to regular monitoring of peak-period airline schedules and delays, to be reported in the Generic EIR and its Annual Updates.	Refer to Section 4.5.4 of the Supplemental DEIS/FEIR for a discussion of the proposed PPP Monitoring Program, which is designed to identify the conditions when airline overscheduling will become a significant contributor of delay. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
C.23	Alternatives	Peak Period Pricing	The Final EIR must also define appropriate conditions at which Massport will begin seeking the necessary federal and state regulatory processes, in order to implement a properly structured PPP program.	Refer to Section 4.5.4 of the Supplemental DEIS/FEIR.
C.24	Environmental Review Process	Public Process	...the Final EIR should include more detailed demographic data on the affected populations in both tabular and graphic form, analysis of the full range of impacts (including noise impacts within the 60 dB contour), a comparison of the affected population with that of Boston and the other affected municipalities, and a discussion of the community participation process used in preparing the Draft and Final EIRs.	More detailed graphics showing affected population and land uses are set out in Chapters 5 and 6 of the Supplemental DEIS/FEIR. Also, data on noise-affected population have been added or made clearer in tables in the Supplemental DEIS/FEIR. There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
C.25	Noise	Mitigation	I am convinced that simply soundproofing the most affected residences and completing the phase-in of quieter Stage 3 aircraft, which is required under Federal law by the end of 1999, cannot be the final answers to the issue of noise mitigation.	Massport's Noise Rules and FAA-approved sound insulation program have been only two elements of its overall noise abatement program. An expanded discussion of Massport's Noise Abatement Program is included in Chapter 8 of the Supplemental DEIS/FEIR. Massport is currently supporting FAA's effort to improve conformance to the new Runway 27 flight corridor and explored means of extending its sound insulation program through innovative investigation of hill effects on sound propagation as discussed in the *Logan Airport 1999 ESPR*. Massport is also actively involved in encouraging growth at Worcester Regional Airport and other alternative airports, and is committed to monitoring and improving the PRAS.
C.26	Noise	Impacts	... The Final EIR should quantify the number of "new" people within each noise contour under the preferred alternative. It should also present information on the 60-65 dB noise contour within the text, and not just in the appendices.	Refer to Tables 5.2-3 and 6.2-3 through 6.2-5 of the Supplemental DEIS/FEIR for population data down to DNL values of 60 dB. Also, refer to newly included and newly excluded populations attributable to the Preferred Alternative in Tables 6.2-6 through 6.2-7 of the Supplemental DEIS/FEIR.
C.27	Noise	Nighttime Noise	At the core of the noise abatement policy stands the commitment in the 1994/95 GEIR to "minimizing nighttime noise and to addressing and responding to noise issues and complaints." ...it is time to turn these general policy goals into specific noise mitigation commitments.	Refer to response to Comment C.7. Massport is committed to a comprehensive noise abatement program, including addressing nighttime noise, as set out in response to Comment C.25.
C.28	Noise	Soundproofing	The Final EIR and the Proposed Section 61 Finding should contain feasible implementation measures to ensure full access to the soundproofing program for all residents who are entitled to its benefits.	Massport is committed to ensuring access to sound insulation for all eligible dwelling units. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
C.29	Noise	Mitigation	Given the number of people who are potentially ineligible for soundproofing because of modeling limitations, in the Final EIR Massport should examine further refinements to its contours that would ensure full access to soundproofing for all affected residents. Also in the Final EIR, Massport must commit to providing soundproofing for all residents currently within the 65 dB contour, even if they would otherwise lose their eligibility as a result of this project.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update)*. In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements.

Code	Topic 1	Topic 2	Comment	Response
C.30	Noise	Soundproofing	I am concerned that the residences most in need of soundproofing will be in low income areas with relatively high proportions of sub-standard housing. The Final EIR should explain how often such circumstances have occurred in the past. If some (presumably low income) residents are likely to be denied noise mitigation on this grounds, the FEIR and the Proposed Section 61 Finding should consider financial or other programs to ensure equal access to noise mitigation.	Federal requirements typically exclude the FAA from any responsibility to bring a building up to code when the structure is sub-standard but otherwise qualifies to participate in an airport sponsored sound insulation program. However, to address impacts in particular projects such as the proposed Airside Project, FAA has discretion to use grant funds to bring buildings up to code as part of the mitigation program to the extent such improvements are required to proceed with the sound insulation work. The mitigation program for the Airside Project includes use of grant funds for such purposes. For the eligible residences, the FAA will fund building code improvements, to the extent necessary, to implement effective sound insulation treatment. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
C.31	Noise	PRAS	...the Final EIR should discuss whether any updates of the PRAS goals are contemplated, and detail any mechanisms for ensuring that the program fulfills its objective of creating an equitable noise distribution.	Section 4.3 of the Supplemental DEIS/FEIR demonstrates that there have been no significant demographic changes to warrant an update of the PRAS goals. The Preferred Alternative mitigation program includes additional reporting requirements recommended to enhance the PRAS monitoring effort. Section 6.2 of the Supplemental DEIS/FEIR addresses the reductions in numbers of most highly exposed people that benefit from improved PRAS achievement under the Preferred Alternative. These reductions are consistent with the PRAS goals.
C.32	Noise	PRAS	Massport must show in the FEIR that its prediction of the future effects of the PRAS goals do not over-estimate FAA's ability and willingness to implement them, as based on past experience.	Section 4.3 of the Supplemental DEIS/FEIR demonstrates that the FAA has improved its performance in achieving the PRAS goals since the enhanced PRAS was installed. The Preferred Alternative mitigation program includes several new elements for an expanded PRAS monitoring and reporting system to encourage FAA controllers. The unidirectional Runway 14/32 would enable FAA controllers to significantly improve achievement of PRAS goals.
C.33	Noise	PRAS	...the FEIR and the Proposed Section 61 Finding must include protocols for monitoring adherence to the PRAS goals, and periodic disclosure of the monitoring results...	Refer to Section 4.3.5 on PRAS monitoring and Section 8.5 of the Supplemental DEIS/FEIR regarding Massport's continued commitment to improve PRAS monitoring and periodic disclosure. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
C.34	Noise	PRAS	The Final EIR should discuss the relationship between the airside program and the recently completed Runway 27 EIS, describe any cumulative impacts on the corridor, and analyze the consistency of the noise impacts with the PRAS goals.	Section 5.2.3 of the Supplemental DEIS/FEIR addresses differences in flight tracks between the Supplemental DEIS/FEIR, the Runway 27 EIS, and the *Logan Airport 1997 and 1998 Annual Updates.* Updates of the noise contours from operations on all runways, including for Runway 27, is discussed in Section 6.2 of the Supplemental DEIS/FEIR.
C.35	Noise	Nighttime Noise	...the PRAS goals seek to route all nighttime flights over the water between 12PM and 6AM. In the FEIR, Massport should report on the feasibility of extending this preferential nighttime period to the hours of 10 PM to 7 AM, and the effect of this change on noise levels and contours.	Section 4.3.6 of the Supplemental DEIS/FEIR provides an analysis of extending the preferential nighttime period from 10 PM to 7 AM.

Code	Topic 1	Topic 2	Comment	Response
C.36	Noise	Hushkitted Aircraft	Massport should begin discussions now with FAA, with the goal of instituting restrictions, either locally or nationally, on hushkitted Stage 3 aircraft.	Massport commits to continue discussions with airlines with the goal of reducing use of hushkitted Stage 3 aircraft at Logan Airport.
C.37	Air Quality	Emissions-Based Landing Fees	Now is the time to implement the broad goal of maintaining or reducing Logan's overall environmental impacts, even as annual passenger volumes rise in the future. To make this commitment more effective, in the GEIR Massport must examine the feasibility of a system of market-based, revenue-neutral landing fees that reward cleaner planes with lower charges, on the principle that "the polluter pays." ... In the GEIR, I am directing Massport to develop and model a system of emissions-based landing fees.	Refer to response to Comment C.5.
C.38	Air Quality	Alternative Fuels	As an initial step toward reducing emissions, Massport should set numerical annual targets in the GEIR for the conversion of its tenants' ground service equipment to clean fuels, and for providing electric power to aircraft at all gates.	As specified in the *Logan Airport 1999 ESPR*, Massport will use the results of its alternative fuel survey to evaluate the feasibility of setting alternative fuel targets for tenant ground service equipment and vehicles.
C.39	Ground Transportation	Access To Logan	One of the cornerstones of Massport's ground access strategy is a commitment to a 35.2% mode share for High Occupancy Vehicles (HOV) when passenger volumes reach 37.5 million annually. ...[A]lthough this goal translates into an increase in HOV mode shares from the present, it also represents a substantial increase in the absolute number of non-HOV trips to the airport, due to the large increase in total number of passengers. Massport has not shown how these non-HOV trips will be accommodated under the parking freeze. Massport should consider a higher target percentage for HOV at 37.5 million annual passengers, and discuss the issue in the GEIR.	The *Logan Airport 1999 ESPR* (formerly the GEIR) which was filed on December 15, 2000, examines the feasibility of a higher target percentage for air passenger HOV ridership than 35.2 percent and discusses parking demand and management.
C.40	Ground Transportation	Access To Logan	Massport should also consider enforcement mechanisms for whatever HOV percentage emerges...	Refer to response to Comment C.39.
C.41	Ground Transportation	Mitigation	In the GEIR, Massport should also consider the consolidation of rental car lots and the courtesy vehicles serving them.	The *Logan Airport 1999 ESPR* (previously GEIR), which was filed on December 15, 2000, discusses the benefits of consolidating rental car lots and the courtesy vehicles serving them.
C.42	Ground Transportation	Access To Logan	...[T]he Final EIR and the analysis in the next GEIR should reflect proposed MBTA improvements in transit access to Logan, including the AITC, the Blue Line modernization, and the Urban Ring.	Refer to response to Comment C.6.
C.43	Alternatives	Runway 14/32	Any proposal to use Runway 14/32 in a bidirectional manner would need additional MEPA review, including the scoping, preparation, and review of an entirely new EIR document.	Massport agrees with this comment. The projected unidirectional use of Runway 14/32 is based upon operational, efficiency and safety concerns, as well as environmental considerations. Moreover, the environmental analyses developed for the Supplemental DEIS/FEIR are based upon the proposed runway being used in a unidirectional manner (*i.e.*, it will be available only for arrivals and departures conducted over Boston Harbor). The unidirectional limitation is inherent to the Runway 14/32 concept that is the subject of the Federal and state environmental review processes.
C.44	Environmental Review Process	MEPA	The Proposed Section 61 Findings in the Final EIR should include this enforceable commitment to unidirectionality. The Final EIR should also document any other legal or administrative processes, or any operational or environmental constraints that can assure unidirectionality.	Draft Section 61 Findings are in Section 8.7 of the Supplemental DEIS/FEIR. Refer to the discussion of unidirectionality in Section 8.5 of the Supplemental DEIS/FEIR.
C.45	Construction	Mitigation	The Final EIR should include a detailed construction management plan that quantifies the number of daily and total truck trips.	A discussion of the construction phasing, truck trips, and mitigation measures to be employed during construction of the Preferred Alternative is presented in Section 6.9 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
C.46	Construction	Impacts	The Final EIR should also address the cumulative impacts of those construction activities for the airside projects occurring simultaneously with Central Artery/Tunnel construction in East Boston, other projects at Logan Airport, and any other major construction activities planned to occur in East Boston.	The cumulative construction impacts associated with the airside projects occurring simultaneously with the Central Artery/Tunnel (CA/T) construction and other projects at Logan Airport and in East Boston are not anticipated to be significant because of project coordination and mitigation programs that will reduce construction period impacts. The peak cumulative construction traffic would occur in 2003, mostly as a result of concurrent CA/T construction on the airport. Truck traffic associated with construction decreases significantly after 2003 as CA/T construction on the airport is completed. Refer to Section 7.5 of the Supplemental DEIS/FEIR for a discussion of cumulative construction impacts.
C.47	Construction	Impacts	The Final EIR should also disclose the full impacts of any nighttime construction, and include an analysis of nighttime construction noise in residential areas potentially affected.	Section 6.9 of the Supplemental DEIS/FEIR includes an analysis of nighttime construction noise in potentially affected residential areas. There is no significant impact.
C.48	Construction	Air Quality	The Final EIR and the GEIR should also discuss the feasibility of Massport's participation in the Clean Air Construction Initiative, both with respect to this project and other construction projects at the airport. The Proposed Section 61 Findings should include appropriate commitments for construction period mitigation, in particular for the traffic, air quality, and noise impacts discussed above.	As stated in Section 6.9 of the Supplemental DEIS/FEIR, Massport is committed to implementing the Clean Air Construction Initiative in cooperation with MADEP and Northeast States for Coordinated Air Use Management (NESCAUM). Furthermore, construction will conform to FAA AC 150/5370-10A, *Standards for Specifying Construction of Airports*. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
C.49	Soil/Sediment	Reuse/Disposal	Massport's preferred alternative involves a substantial amount of soil excavation. The Department of Environmental Protection has raised several issues regarding excavate classification and management, to which the Final EIR should respond in detail.	The Airside Project Draft EIS/EIR presented language to provide context for Governors Island soil classification that was initially conducted before the current Massachusetts Contingency Plan (MCP) was implemented. The volume of excavate has been reduced as a result of the on-going removal of stockpiled Central Artery/Tunnel soil material from Governors Island, and the findings of a subsurface investigation program show that much of the existing soil material on the airport is suitable for construction and therefore does not have to be removed. The Supplemental DEIS/FEIR has been revised to incorporate DEP comments and to minimize confusion between the two classification terminologies.
C.50	Noise	Open Space/ Parkland	The Final EIR should analyze the environmental impacts of the airside projects (including cumulative impacts with other airport operations) on the Harbor Islands, Arnold Arboretum, Franklin Park, and the Emerald Necklace.	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands. See also 49 U.S.C. Section 47101 (h) (2) which provides that Logan Airport operations are not deemed to constitute use of the Boston Harbor Islands.

Code	Topic 1	Topic 2	Comment	Response
C.51	Ecosystem	Rare Species	The discussion of on-site mitigation [for rare species impacts] in the DEIR is generally adequate. The Final EIR should provide greater detail on the proposed off-site mitigation, including the specifics of the habitat restoration proposed at the Massachusetts Military Reservation. The Final EIR should also include sufficient information for the Natural Heritage Program to evaluate the merits of a Conservation Permit. The Proposed Section 61 Finding should include all on-site and off-site mitigation for impacts to rare species.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.
C.52	Environmental Review Process	MEPA	The Final EIR should include Proposed Section 61 Findings for each area of impact associated with Massport's preferred alternative. I remind Massport of the importance of the Section 61 Findings as a mechanism for formalizing the mitigation commitments that emerge from the EIR process, and I expect that the Section 61 Findings will commit to appropriate mitigation.	Draft Section 61 Findings are in Section 8.7 of the Supplemental DEIS/FEIR.
C.53	Environmental Review Process	MEPA	The Final EIR should include a copy of this Certificate and copies of all comments received, and it should respond to all substantive comments received.	The Final EIR includes a copy of the MEPA Certificate and copies of all comments received. The Final EIR also includes responses to all substantive comments.
C.54	Environmental Review Process	FAA/NEPA	For those who submitted form letters for which addresses are available, Massport should send a Notice of Availability of the Final EIR and include information on comment deadlines and the time-sensitive nature of the review process. For those who submitted individual comment letters, Massport should circulate an Executive Summary of the Final EIR. ... Massport should circulate the full Final EIR to its standard distribution list of agencies and community groups, as well as to any additional parties specified in Section 11.16 of the MEPA regulations....[Massport should] furnish a full copy of the EIR to any party who requests a copy.	A Notice of Availability of the Supplemental DEIS/FEIR has been sent to those who submitted form letters for which addresses are available. The Notice includes information on comment deadlines. An Executive Summary of the Supplemental DEIS/FEIR has been circulated to those who submitted individual comment letters. A Supplemental DEIS/FEIR has been sent to Massport's standard distribution list of agencies and community groups as well as to additional parties specified in Section 11.16 of the MEPA regulations. A Supplemental DEIS/FEIR will be furnished to any party who requests a copy.

LETTER 1

Ms. Jane Garvey
Administrator
Federal Aviation Administration
800 Independence Ave, SW
Washington, DC 20591

Dear Administrator Garvey,

I write to express my deep and continuing concern regarding the Massachusetts Port Authority's proposal to construct Runway 14/32 at Logan International Airport and to urge that you advise against further action to develop the runway.

Logan has reached capacity. Though the airport may technically have the physical capability to accommodate further increases in traffic, the human and social costs are prohibitively high. Moreover, expansion of the airport is at this time, absent a more thorough and comprehensive plan and firm timetable to implement such plan, an insufficent response to Logan's traffic problems. With or without construction of a new runway, estimates of the increase in Logan's air traffic over the next ten years alone are as high as seventy percent – and some projections indicate more than double today's air traffic by the middle of the next century. 1.1

For more than twenty years, state officials, in cooperation with other agencies, community groups, and businesses, have advocated a regional approach. Unfortunately, no clear mission has been developed and little action has been taken to address the problem in a thoughtful and forward-looking way. Today, the state is making great progress toward improving the terminals and other land-side facilities at Logan, but it has promoted Runway 14/32 as its *only* proposal to improve the region's air traffic configuration. A more comprehensive, regional approach has gone unaddressed. 1.2

A full consideration of alternatives is needed before a piecemeal response is approved. Some proposals not yet thoroughly considered include immediate implementation of incentive "peak-pricing," diversion of small aircraft to alternate airports, and more effective use of underutilized regional airports such as Hanscom Airfield (only a few minutes drive from Boston's downtown), the Municipal Airport in Worcester, Massachusetts, Weymouth Airport in Weymouth, Massachusetts, T. F. Green Airport in Providence, Rhode Island, Manchester Airport in Manchester, New Hampshire, and Pease Airport in Portsmouth, New Hampshire. 1.3 1.4

I urge the FAA to demand full consideration of a comprehensive plan for air traffic in Eastern Massachusetts *before* proceeding with patchwork projects that only provide short-term solutions for a long-term problem. Before any major action is taken, a comprehensive plan and a definitive schedule for implementation must be in place, and adequate funding must be secured.

Thank you for your attention to this matter of great importance to our regional economy, and to the health and welfare of the people of Eastern Massachusetts.

Sincerely,

Michael E. Capuano

Michael Capuano
Member of Congress

Letter 1
US Congressman Michael Capuano

Code	Topic 1	Topic 2	Comment	Response
1.1	Purpose and Need	Economic Costs	Though the airport may technically have the physical capability to accommodate further increases in traffic, the human and social costs are prohibitively high.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
1.2	Regional Transportation	Regional Airports	For more than twenty years, state officials, in cooperation with other agencies, community groups, and businesses, have advocated a regional approach. Unfortunately, no clear mission has been developed and little action has been taken to address the problem in a thoughtful and forward-looking way. ... A more comprehensive, regional approach has gone unaddressed.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
1.3	Alternatives	Peak Period Pricing	Some proposals not yet thoroughly considered include immediate implementation of incentive "peak-pricing"	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption program. Previous attempts at differential landing fee programs at Logan Airport and the analysis presented in the *1993 Strategic Assessment Report* are described in Section 3.5 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
1.4	Regional Transportation	Regional Airports	Some proposals not yet thoroughly considered include diversion of small aircraft to alternate airports, and more effective use of underutilized regional airports such as Hanscom Airfield, the Municipal Airport in Worcester, Weymouth Airport, T.F. Green Airport, Manchester Airport, and Pease Airport.	Although prioritizing takeoffs based on aircraft size might reduce delays, the air traffic control system of the United States, which the FAA operates, is based on a first-come, first-serve policy under most circumstances. Any change in this policy would require a major federal decision and would involve a massive overhaul of the entire air traffic control system, including procedures, manuals, software, controller/pilot training, etc. Changing the policy for a single airport would be nearly impossible for administrative reasons and would create serious safety issues with non-standard procedures. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.

LETTER 2

John P. DeVillars, Regional Administrator
United States Environmental Protection Agency
Region One
One Congress Street, Suite 1100
Boston, Massachusetts 02114-2023

Dear Mr. DeVillars:

I am writing to express my opposition to the proposed expansion of Logan International Airport, including the planned construction of Runway 14/32. The construction of this new runway would expand Logan's capacity for operations and increase its current potential for future growth. But there are several reasons why the Environmental Protection Agency should advise the Federal Aviation Administration against the implementation of Runway 14/32. These include the resulting increase in noise pollution and other adverse environmental impacts, Runway 14/32's ineffectiveness in alleviating delays, and the lack of a comprehensive, progressive regional plan to best utilize New England's regional airports. 2.1

Alternative 1A, the state proposal described by the Massachusetts Port Authority in its Draft Environmental Impact Statement/Report (DEIS/DEIR), details the agency's plan to expand and improve Logan. This alternative consists of the construction of Runway 14/32, as well as the construction of a new Centerfield Taxiway and the reduction of the approach minimums on Runways 22L, 27, 15R, and 33L. I am urging you to join me in opposition to the implementation of this alternative.

According to the aforementioned document, the primary reason for implementation of Runway 14/32 is to alleviate delays caused by the use of a less-than-three runway configuration when Logan is burdened by winds coming from the northwest. The operation of Runway 14/32 may alleviate some of these pressures of delay. However, this will only be true in Low Fleet conditions, when commuter aircraft represent a smaller share of the fleet serving Logan. In High Fleet scenarios, in which more planes are used and overscheduling becomes a factor in delays during peak times, Runway 14/32 becomes more of a hindrance than an assistance. 2.2

Massport projects that in a 37.5 million High Fleet passenger scenario, there will be approximately 250,000 annual hours of delay with the implementation of Alternative 1A. If Alternative 2 were implemented, which omits the construction of 14/32 but includes Peak Period Pricing, delays would amount to approximately 205,000 hours. The execution of Alternative 3, which consists of no infrastructure changes but requires the implementation of Peak Period Pricing and the reduction in the approach minimums on Runways 22L, 27, 15R, and 33L, results in 210,000 hours of delay. Under the 45 Million High Fleet scenario, similar percentages in the total annual hours of delay are present. As you can understand by these projections, if a High Fleet develops at Logan and overscheduling becomes a factor, Runway 14/32 is no longer effective without additional mitigating measures.

For decades, communities surrounding Logan International Airport have been adversely affected by hostile environmental conditions, including noise pollution, air pollution and ground traffic. Noise pollution has steadily increased over the years in Logan's neighboring communities such as Revere, Winthrop, and East Boston. Residents of these areas have battled consistently without much success in attempting to decrease existing levels of air traffic

over their communities. The operation of Runway 14/32 will cause a shift in the flight tracks over the Greater Boston Area and the volume of flights traveling over specific communities. The DEIR claims those communities that have experienced the heaviest volume of overflights, like Winthrop and East Boston, will endure less air traffic while other fringe communities, such as Everett, will bear a much greater number of overflights.

Although the runway will assist in lessening the intensity of noise in some affected areas, the implementation of 14/32 will widen the overall scope of communities exposed to noise levels greater or equal to 65 dB by 2%. Based on testing for Alternative 1A, Massport estimates that in a 29 Million Passenger Low Fleet scenario for 1999, the total population exposed to noise levels greater or equal to 65 dB is 17,909. However, the totals for Alternative 2 and 3 (16,892) and Alternative 4 (17,531), representing the continuation of present conditions at the airport, affect a smaller amount of residents in the Greater Boston area. This pattern is also apparent in the 1999 High Fleet and the 2010 noise levels for both the 37.5 Million Low and High Fleets.

I am firmly convinced that we must examine closely the status of our regional aviation transportation system before we implement any new structural changes at Logan International Airport. It is projected that the Route 128 and I-495 corridors will experience this commonwealth's greatest population increases as we approach the new millennium. It is the responsibility of both the federal and state governments to devise a strategy that ensures that some of the burden at Logan is relieved by those regional commercial airports that would welcome increases in regularly-scheduled passenger service. I agree with Boston Mayor Tom Menino that a "blue ribbon panel" should be established to devise such a regional aviation transportation strategy. 2.3 2.4

We must consider the adverse environmental impacts on those communities surrounding this airport. The primary goal for its construction is to alleviate delays caused when Logan is burdened by heavy Northwest winds. In some future scenarios, this short-term solution will serve its intended purpose. However, without a plan for the optimal use of our regional airports to alleviate these pressures from Logan, I cannot support the implementation of a new runway or any additional expansion of Logan Airport.

Thank you in advance for your consideration. I look forward to reviewing the EPA's response to these concerns. If you have any questions or would like to further discuss this matter, please feel free to reach me by contacting my Medford District Office at (781)396-2900.

Sincerely,

Edward J. Markey

Code	Topic 1	Topic 2	Comment	Response
2.1	Alternatives	Runway 14/32	The construction of this new runway would expand Logan's capacity for operations and increase its current potential for future growth.	The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in future passenger and aircraft activity at Logan Airport. The environmental impacts associated with these alternative forecasts have been evaluated in the Logan Airport Airside analysis and GEIRs.
2.2	Alternatives	Runway 14/32	In High Fleet scenarios, in which more planes are used and over scheduling becomes a factor in delays during peak times, Runway 14/32 becomes more of a hindrance [in reducing delays] than an assistance.	In the current environment, airline overscheduling is not a significant contributor to Logan Airport delays. Proposed Runway 14/32 and all other proposed projects would reduce current and future delays and enhance safety. The sooner that these improvements are implemented, the more long-term delay benefits will be realized.

Code	Topic 1	Topic 2	Comment	Response
2.3	Regional Transportation	Regional Airports	We must examine closely the status of our regional aviation transportation system before we implement any new structural changes at Logan International Airport. It is the responsibility of both the federal and state governments to devise a strategy that ensures that some of the burden at Logan is relieved by those regional commercial airports that would welcome increases in regularly scheduled passenger service.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of regional alternatives to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of regional alternatives to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
2.4	Environmental Review Process	Blue Ribbon Panel	A "blue ribbon panel" should be established to devise such a regional aviation transportation strategy.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies have concluded that The Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high-speed rail are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of regional transportation alternatives to Logan Airport and steps Massport has taken to foster increased use of these alternatives. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999, attendance at a second summit in December 2000, and its assumption of operating responsibility for the Worcester Regional Airport in January 2000.

LETTER 3

April 22, 1999

The Honorable Robert Durand
Secretary of Environmental Affairs
Executive Office of Environmental Affairs
Commonwealth of Massachusetts
Attention MEPA Office, EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Dear Secretary Durand:

As United States Representative for the 9th Congressional District, I am submitting the attached letter to be included as part of the official public comment on the Draft Environmental Impact Statement and Draft Environmental Impact Report ("Draft EIS/EIR") for the Logan Airside Improvements Planning Project.

Please find attached a letter that I wrote to Federal Aviation Administrator Jane Garvey on March 29, 1999, which outlines my concerns with the Draft EIS/EIR in detail. It is my belief that the Draft EIS/EIR contains such serious deficiencies that the proposal should be withdrawn immediately.

The unfair negative environmental impact of proposed Runway 14/32 is simply too severe given the very limited and short term nature of its delay reduction benefits. Under no circumstances, should this proposal be approved. Instead, it is critical that this deeply flawed Draft EIS/EIR be replaced with a comprehensive, long term solution that fairly and effectively addresses our region's air transportation needs.

Thank you for your attention to this critical issue.

Sincerely,

John Joseph Moakley
Member of Congress

March 29, 1999

Mrs. Jane Garvey
Administrator
Federal Aviation Administration
800 Independence Avenue, SW
Washington, DC 20591

Dear Administrator Garvey:

I am writing to express my serious concern with deficiencies in the Draft Environmental Impact Statement (EIS) on the Logan Airside Project, particularly as they pertain to the new proposed Runway 14/32. This document proposes to substantially expand Logan International Airport without adequately examining the significant environmental impact on communities surrounding the airport or the alternatives to Logan's expansion. These deficiencies are so substantial that the Federal Aviation Administration should withdraw support from the current document and re-evaluate solutions to Logan's delay issue.

Specifically, the EIS does not adequately comply with President Clinton's Executive Order on Environmental Justice of February 11, 1994. This order directs all federal agencies to identify and address all disproportionately high and adverse environmental effects of its programs, policies and activities on low-income and minority populations. This document ignores the basic requirement of identifying minority and low-income populations affected by proposals contained within the EIS, despite the fact that the document predicts substantial increases in air traffic over portions of the Boston neighborhoods of Jamaica Plain, Roxbury, South Boston, East Boston, the South End and the City of Chelsea. While these communities contain significant minority and low income populations, no effort is made within the EIS to identify these populations or to adequately address the disproportionately high environmental impact that Logan's expansion will have on these residents. 3.1

What is even more disturbing is that the EIS proposes this disproportionate environmental impact on the low income and minority residents in communities surrounding Logan Airport without fully examining a reasonable range of alternatives to Logan's expansion. At no point does the EIS analysis address the potential of increased utilization of Hanscom Field, a facility owned and operated by the Massachusetts Port Authority (Massport) that is in close proximity to the Boston. With a potential capacity of 320,000 operations annually and ready access to Boston via Route 128, Hanscom Field must be explored as should the prospect of building a second major airport. The EIS is also deficient in not treating increased utilization of existing regional airports including Manchester, T.F. Green (Providence) and Worcester as alternatives to Logan 3.2

expansion.

The EIS also fails in addressing a badly needed peak period management program for Logan Airport. Peak Period Pricing has been identified by analysts as an administrative option that offers significant delay reduction benefits. By only exploring the impact of Peak Period Pricing during favorable weather conditions based upon 110 operations per hour, the EIS fails to accurately reflect the benefits of this option during adverse weather conditions when delays are most problematic. The scope of analysis must be expanded to show the impact of this option when a variety of conditions dictate that Logan operate at 75, 85, 95, 105 and up to 115 movements per hour. 3.3

The EIS further fails to identify any reasonable maximum limit on activity that Logan Airport can accommodate. While the stated purpose of the proposed Runway 14/32 is to reduce delays at Logan Airport, Massport forecasts such a significant increase in the number of aircraft operations that delays will reach current levels within five years after the proposed runway is built. The negative environmental impact of proposed Runway 14/32 is simply too severe given the limited and short term nature of its delay reduction benefits. A clear and reasonable ceiling on operations at Logan must be established before any environmentally sound proposal to alleviate delay can be considered. 3.4

For these reasons, the current Draft Environmental Impact Statement for the Logan Airside Project is deficient and should be replaced with a study that is much broader in scope. This study must fully explore all possible alternatives to Logan expansion and place particular emphasis on environmental justice for the communities impacted by the airport. The Federal Aviation Administration should withdraw support for the proposal containing Runway 14/32 and work to replace it with a comprehensive, long term solution that effectively and fairly addresses our region's air transportation needs.

I greatly appreciate your outstanding leadership in planning and developing a safe and efficient national airports system and I look forward to working with you on this important issue.

Sincerely,

John Joseph Moakley
Member of Congress

Letter 3
US Congressman J. Joseph Moakley

Code	Topic 1	Topic 2	Comment	Response
3.1	Environmental Justice	Demographic Data	Specifically, the EIS does not adequately comply with President Clinton's Executive Order on Environmental Justice of February 11, 1994. This document ignores the basic requirement of identifying minority and low income populations affected by proposals contained within the EIS, despite the fact that the document predicts substantial increases in air traffic over portions of the Boston neighborhoods of Jamaica Plain, Roxbury, South Boston, East Boston, the South End and the City of Chelsea. While these communities contain significant minority and low income populations, no effort is made within the EIS to identify these populations or to adequately address the disproportionately high environmental impact that Logan's expansion will have on these residents.	The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
3.2	Regional Transportation	Regional Airports	The EIS proposes this disproportionate environmental impact without fully examining a reasonable range of alternatives to Logan's expansion. At no point does the EIS analysis address the potential of increased utilization of Hanscom Field. The EIS is also deficient in not treating increased utilization of existing regional airports including Manchester, T.F. Green (Providence) and Worcester as alternatives to Logan expansion.	The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR contain analysis on an appropriate range of alternatives as required by Federal and state scoping directives issued under NEPA and MEPA irrespectively. Further analysis in these environmental review documents indicates that there is no disproportionate environmental impact associated with the Preferred Alternative. The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR provide an evaluation of the regional airports at T. F. Green/Providence, Manchester, and Worcester and their potential impacts on Logan Airport. Hanscom Field is the region's premier general aviation facility and accommodated over 180,000 aircraft operations in 1998. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to the growth pressures at Logan Airport. Nevertheless, the proposed Logan Airport Airside Project is necessary and provides clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. The FAA will be an active participant in the upcoming New England Airports System Study which will evaluate the impact of recent regional airport developments on Logan Airport, identify constraints to regional airports growth and highlight strategies for optimizing New England's regional aviation system. Refer to Section 2.9 of the Supplemental DEIS/FEIR.
3.3	Alternatives	Peak Period Pricing	The EIS also fails in addressing a badly needed peak period management program for Logan. The scope of analysis must be expanded to show the impact of this option....	The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR contain analysis of PPP as a demand management alternative at Logan Airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
3.4	Alternatives	Operational Restrictions	The EIS further fails to identify any reasonable maximum limit on activity that Logan Airport can accommodate. A clear and reasonable ceiling on operations at Logan must be established before any environmentally sound proposal to alleviate delay can be considered.	The Airside Project will not change Logan Airport's airfield capacity of approximately 120 aircraft operations per hour. Regarding caps on airport operations, federal constitutional provisions (preemption, commerce clauses, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. Massport has undertaken a comprehensive mitigation program, such as Logan Airport Noise Rules, for those areas that fall within its powers as proprietor of Logan Airport, which are not preempted under federal law.

MEMORANDUM FOR: Susan B. Fruchter
Acting NEPA Coordinator

FROM: Charles W. Challstrom
Acting Director, National Geodetic Survey

SUBJECT: DEIS-9902-04-Logan Airside Improvements Planning Project
Boston, Massachusetts

The subject statement has been reviewed within the areas of the National Geodetic Survey's (NGS) responsibility and expertise and in terms of the impact of the proposed actions on NGS activities and projects.

All available geodetic control information about horizontal and vertical geodetic control monuments in the subject area is contained on the NGS home page at the following Internet World Wide Web address: http://www.ngs.noaa.gov. After entering the NGS home page, please access the topic "Products and Services" and then access the menu item "Data Sheet." This menu item will allow you to directly access geodetic control monument information from the NGS data base for the subject area project. This information should be reviewed for identifying the location and designation of any geodetic control monuments that may be affected by the proposed project.

If there are any planned activities which will disturb or destroy these monuments, NGS requires not less than 90 days' notification in advance of such activities in order to plan for their relocation. NGS recommends that funding for this project includes the cost of any relocation(s) required. 4.1

For further information about these monuments, please contact Rick Yorczyk; SSMC3, NOAA, N/NGS; 1315 East West Highway; Silver Spring, Maryland 20910; telephone: 301-713-3230 x142; fax: 301-713-4175.

NGS recommends that funding for this project includes the cost of any relocation(s) required.	The Preferred Alternative will not result in any disruption, destruction, or relocation of any horizontal or vertical geodetic control monuments. NGS will be notified prior to construction if any NGS monuments are identified.

LETTER 5

United States Department of the Interior

OFFICE OF THE SECRETARY
Washington, D.C. 20240

ER-99/193

Mr. Robert S. Bartanowicz
Regional Administrator
New England Region
Federal Aviation Administration
12 New England Executive Park
Burlington, Massachusetts 01803

Dear Mr. Bartanowicz:

This is in response to the request for the Department of the Interior's comments on the Draft Environmental Impact Statement/Section 4(f) Evaluation for the Logan Airside Improvements Planning Project, Logan International Airport, Boston, Suffolk County, Massachusetts.

We concur that there is no prudent and feasible alternative to the proposed project, if project objectives are to be met. We also concur with the proposed measures to minimize harm to Section 4(f) resources. However, we recommend continued cooperation and coordination with the State Historic Preservation Officer in order to determine whether a Memorandum of Agreement (MOA) is needed to avoid and/or minimize harm to cultural resources which may be affected by the proposed project, in compliance with Section 106 of the National Historic Preservation Act of 1966, as amended. A signed copy of the MOA should be included in the Final Section 4(f) Evaluation, if one is prepared. 5.1 5.2

The Department of the Interior has no objection to Section 4(f) approval of this project by the Department of Transportation.

We appreciate the opportunity to provide these comments.

Sincerely,

Willie R. Taylor
Director, Office of Environmental
Policy and Compliance

cc: Ms. Trudy Coxe, Secretary
Executive Office of Environmental Affairs

OFFICE OF THE
GIONAL ADMINISTRATOR

April 22, 1999

John Silva
Manager, Environmental Programs
Airports Division, ANE-600
Federal Aviation Administration
New England Regional
12 New England Executive Park
Burlington, Massachusetts 01803

RE: Draft Environmental Impact Statement/Report Logan Airside Improvements Planning Project dated February, 1999 (EPA ERP Number D-FAA-B51017-MA)

Dear Mr. Silva:

In accordance with EPA's responsibilities under the National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act, we have reviewed the Draft Environmental Impact Statement (DEIS) prepared by the Federal Aviation Administration (FAA) and the Massachusetts Port Authority (Massport) for proposed airside improvements at Logan Airport in Boston, Massachusetts.

The project includes construction of a new runway (runway 14/32), new taxiways and taxiway alignments, and reductions in approach minimums on runways 22L, 27, 15R and 33L. In addition to the no-build alternative, the DEIS analyzes four sets of alternatives and evaluates the relative effectiveness of each in enhancing operational safety and reducing current and future aircraft delay at Logan caused by northwest wind and weather conditions. Airport delays are presented in the context of forecasts for the year 2010 that predict between 37.5 to 45 million passengers a year using Logan, a number substantially greater than Logan's 26.5 million passengers in 1998. The range of alternatives in the DEIS focuses solely on "airside" improvements as a means of eliminating delay.

EPA has long opposed efforts to expand the capacity of Logan Airport without first (1) adequately mitigating noise and pollution impacts to surrounding communities and the region from existing operations, and (2) adopting a comprehensive, multi-modal regional transportation strategy. EPA has raised these concerns each time Massport has proposed improvements to Logan, including in our scoping comments for this EIS in November, 1995. Regrettably, the

proposed project and the EIS fail to adequately address either of these concerns. Therefore, when considered in the context of the already significant burden on surrounding communities from existing airport operations and the absence of an underlying regional transportation strategy, I believe the project cannot be justified.

Specifically, my objections are as follows:

- **The significant community impacts of current Logan operations must be fully addressed and mitigated before any expansion of operations is considered.** The burden borne by the communities near Logan is already enormous, and the efforts to mitigate this burden currently fall short of the mark. The soundproofing of homes now exposed to high levels of aircraft noise, while of limited value (given that it only reduces noise exposure for people when they are inside buildings with shut windows and is not effective in homes exposed to higher than 70 dBA), is nevertheless an essential commitment whose implementation is as yet not completed. Valid concerns have been raised about the computer model used to identify homes eligible for soundproofing. Thus, while the DEIS promises as mitigation the soundproofing of all homes newly exposed to high levels of aircraft noise as a result of the proposed project, there remains uncertainty as to whether the mitigation covers enough homes, and whether Massport and FAA will have adequate funding to carry out this commitment. EPA is especially concerned that FAA has historically not fully funded its share of the soundproofing program for Logan. 6.1

  In addition, commitments for improvements to the Blue Line Station at Logan, which were to provide same-level platform connections between the subway and shuttle buses and thereby improve transit access and reduce traffic, have not been kept. Given the impacts currently felt by affected communities and the inadequacy of previously promised relief, it is not reasonable to ask these communities to accept the impacts of further expansion at Logan unless and until current impacts are fully mitigated. 6.2

- **The DEIS fails to consider adequately environmental justice issues, specifically whether there are disproportionate environmental impacts to low-income and minority populations.** The environmental justice analysis in the DEIS does not meet federal obligations concerning environmental justice. This is especially problematic in light of the fact that the proposed project will result in a threefold increase in aircraft overflights in East Boston, Chelsea, Roxbury, and other communities with large populations of low-income and minority people. The brief and narrowly focused discussion of this important subject falls short in several ways. First, FAA's and Massport's conclusion that minority and low-income communities do not experience disproportionately high impacts does not appear to be credible. The analytic basis for the conclusion is insufficient since critical demographic and other relevant health data are missing. Moreover, the DEIS does not compare the demographics of communities served by this project to the demographics of communities bearing the burden of the project's impacts. Second, the environmental justice analysis in the DEIS focuses solely on noise and ignores credible public comments identifying air quality, odor, traffic and other 6.3 6.4 6.5

impacts that cumulatively burden surrounding communities with high percentages of low-income and minority populations. For all of the above reasons, the cursory attention to environmental justice issues in the DEIS is not acceptable.

- **The DEIS does not reflect a regional, long-term strategy for New England's transportation infrastructure.** Massport and the FAA cannot look solely to airside improvements to address its flight delay problems. The DEIS thoroughly describes the positive steps that Massport and the FAA have taken to contribute to regional transportation planning, including their support for use of regional airports. But the core of the analysis nevertheless simply assumes that Logan's flight operations will grow unchecked over the next decade regardless of successful development of alternatives, and does not include in its analysis broader options to manage Logan's growth and the resulting delays. In order to manage growth so that it reduces rather than increases environmental impacts on nearby communities, Massport and the FAA must pursue even more aggressively a long-term, multi-modal regional transportation strategy.

  Our challenge is a transportation challenge, not simply an aviation challenge, and thus requires the full and active investment of time and resources by not only Massport and the FAA but also other state and federal transportation agencies such as the Executive Office of Transportation and Construction, Amtrak, and the U. S. Department of Transportation. The goals should be 1) to increase alternatives to air travel through Logan, not only through use of T. F. Green in Rhode Island, Worcester Airport in Massachusetts, Manchester Airport in New Hampshire and other regional airports, but also through intercity high-speed rail connections supported by a North-South Station link; 2) to establish efficient mass transit access to and between the regional airports; and 3) to reduce Logan's traffic impacts on surrounding communities by such measures as a free shuttle service between South Station and Logan, an intermodal terminal at Route 128, and the Urban Ring. 6.6 6.7 6.8 6.9

  In addition, Massport should reduce the small plane mix from Logan's peak traffic hours through a peak period pricing strategy, implemented with appropriate sensitivity to the needs of communities served exclusively by smaller aircraft. Additional analysis is critical to determine whether the imposition of peak period pricing now would help send the necessary market signals to ensure that airlines' plans result in the most efficient use of Logan Airport (including smarter use of other regional airports, and, for smaller carriers, the use of planes capable of handling more passengers). Absent a comprehensive plan, the DEIS projects that within five years of project completion, delays at Logan will exceed current levels. This forecast suggests that unchecked growth cannot be a responsible planning assumption for this airport. The efforts of Massport and other regional transportation officials should be aimed first at developing a comprehensive plan, not a narrowly-focused airside improvement project with only short-term effects on delays at Logan. 6.10 6.11

- **The DEIS's analysis of noise impacts rests on questionable model inputs and precepts.** The affected communities have raised serious and credible concerns about the

ability of the computer modeling relied upon in the DEIS to accurately reflect noise levels associated with Logan operations and to select homes eligible for soundproofing. These concerns are based on in situ noise monitoring which appears to demonstrate that computer modeling underestimates actual noise levels, at least in some neighborhoods. The DEIS does not properly address this deficiency and thus does not adequately represent the likely actual noise impacts. Furthermore, the noise increases to neighborhoods that fall outside the FAA's 65-dBA contour remain inadequately acknowledged and addressed, as do the very high noise levels that occur each time aircraft fly over or by neighborhoods. The DEIS does not fully disclose the sleep disruption and other impacts that occur in these instances, nor does it address cumulative noise impacts to account for all noise, not just modeled aircraft noise, as is required under NEPA. In addition, the use of 1993 is not appropriate as the base year for analysis as it does not represent existing conditions and may minimize the relative noise impacts from the preferred alternative when compared with what appears to have been an especially noisy base year.

6.12

6.13

6.14

6.15

- **The DEIS analyses ignore the critical question of whether the improvements will spur additional growth at the airport.** In comparing the alternatives, both the noise and air quality analyses assume that the future passenger/flight operations growth at Logan will remain constant regardless of whether or not the runway 14/32 is constructed. The analysis thereby avoids any serious consideration of what appears to be one of the most critical questions posed by this project-- whether the proposed improvements, especially when combined with landside improvements, cumulatively facilitate future growth in flight operations and passenger traffic with corresponding increases in noise, traffic, and air pollution impacts.

6.16

Efficient operations at Logan are clearly important to the New England economy. However, efficiency gains through proposed infrastructure improvements should only be advanced if they can be achieved without sacrificing the well-being of the communities around the airport and the region at large. Smart growth requires efficient transportation, but it also requires that we preserve and enhance the livability of established, urban communities. A comprehensive transportation strategy that looks beyond quick fixes at Logan can meet both goals. As discussed in this letter and in the attachment, the current DEIS presents a project with serious impacts in an analysis that lacks adequate consideration of alternate strategies to achieve project goals. I request that Massport and FAA withdraw the DEIS and instead focus on developing a more comprehensive regional approach to transportation in New England. I would be pleased to work with Massport, the FAA, and the affected communities in the region to that end.

Despite the concerns expressed in this letter and the attached analysis, I want to acknowledge the professional and fully cooperative spirit of Massport and the FAA in their work with us since the DEIS was published. Peter Blute, Betty Desrosiers, and their team have demonstrated a total commitment to honest, open dialogue with EPA. They have advanced their arguments professionally and forcefully and without fail have responded thoughtfully to our questions. For this we owe them our appreciation and respect.

Please feel free to contact me or Elizabeth Higgins of my staff at 617/918-1051 if you wish to discuss these comments further.

Sincerely,

John P. DeVillars
Regional Administrator

Attachment to EPA's Comment Letter on Logan Airside Improvements Planning Project

The Draft Environmental Impact Statement (DEIS) for the proposed airside improvements at Logan Airport fails to provide an adequate review of the environmental impacts and the full range of alternatives to the project. The preceding cover letter summarizes the primary conclusions from EPA's review of the DEIS. This attachment provides support for those conclusions and raises some additional technical concerns.

Narrow Scope of DEIS Analysis and Alternatives

Failure to Address EPA's EIS Scoping Comments: The DEIS fails to address fundamental issues raised in EPA's 1995 scoping letter. Most importantly, the scope of the DEIS, with its focus on construction of proposed runway 14/32 and the taxiway improvements, is too limited and fails to seriously consider regional improvements as alternatives to the Logan runway project. The limited scope of analysis represents a missed opportunity for a comprehensive analysis and merely compounds difficult decision making surrounding changes to Logan's operations. As EPA indicated in its previous comments, the DEIS should have identified a targeted regional strategy including both existing and potential capacity, as well as regional pricing and marketing to enhance the capacity and efficiency of, and access to, all New England airports. The FAA, as the federal agency responsible for our nation's air travel, has a responsibility to maximize the regional efficiency of the airport network in New England. In this case, EPA would expect the FAA to coordinate the efforts of Massport and the other regional airports, but also to actively involve other federal counterparts at the Federal Transit Administration and the U. S. DOT to explore regional strategies to increase the availability of other airports as an alternative to Logan. Further, Massport has a responsibility to work closely with the appropriate state and federal agencies to develop such a regional strategy. 6.17

As EPA indicated in comments on the DEIS scope, the airside and landside projects are functionally linked, and as such, they should be evaluated together in a comprehensive EIS. The current analysis focuses entirely in airside issues with no real analysis of opportunities for Massport to integrate landside and airside planning to enable Logan to improve operations and handle the substantially greater numbers of passengers anticipated for the coming decades. In response to our scoping comments, the DEIS explains that the analysis is based on background planning information provided in the state Generic Environmental Impact Report (GEIR) and that the DEIS is based on the FAA scope which was developed through a public comment process. Unfortunately, our comments on the appropriate scope of analysis for the EIS were largely discounted, and the GEIR, a document prepared under the rules of state law, does not meet the requirements of NEPA. Thus, reliance on the GEIR to satisfy NEPA's requirements for a cumulative impact analysis is not appropriate. 6.18

Need to Focus on Regional, Multi-Modal Transportation Plan: EPA recommends that, rather than proceeding with the environmental review of the taxiway and runway improvements, Massport and FAA focus instead on establishing a strategy to make Logan Airport a more efficient transportation center with less impact on surrounding communities, by improving mass transit access to the Airport and preventing growth in the number of flight operations. 6.19

One means to reduce the growth pressures on Logan Airport is to enhance the current intercity transportation options. The DEIS does reflect the fine and successful work by both private enterprise and regional transportation officials to encourage greater use of Green and Manchester Airports and to complete the high-speed rail link with New York. Without question, these efforts will improve travel options for New Englanders and better manage growth at Logan Airport. However, Massport, in cooperation with EOTC, U. S. DOT, Amtrak, and other transportation agencies, should take active measures to promote high speed rail as one of the best alternatives to air travel that could help to reduce demands on Logan. These efforts should not be limited to high speed rail but should also encourage and market the use of other regional airports to the benefit of Logan and surrounding communities. Moreover, we believe the EIS should clearly identify mitigation commitments by Massport to improve mass transit to those airports and to solidify transit links among the regional airports similar to the bus links available between Dulles and National or LaGuardia and JFK. 6.20 6.21

In addition, the implementation of peak period pricing should be a piece of the regional transportation strategy. Peak period pricing, implemented with sensitivity to the needs of New England communities served by smaller airports that rely principally on smaller aircraft, could serve to reduce flight operations during peak hours and increase the proportional share of larger aircraft, thereby making the airport more efficient in handling a large volume of passengers with fewer aircraft operations. The DEIS clearly demonstrates that peak period pricing would serve to lessen delays substantially in the high growth future scenarios (e.g., 45 million passengers/high fleet, 45 million passengers/low fleet or 37.5 million passengers/high fleet). However, the DEIS concludes that peak period pricing is not warranted because current flight operations do not exceed 120 operations per hour. Under current conditions approximately 40 percent of the operations at Logan serve approximately 10 percent of the passengers in regional aircraft. If 22 percent of the operations were to handle the same number of passengers, Logan could operate comfortably at 95-100 movements an hour. Additional analysis is critical to determine whether the imposition of peak period pricing now would help send the necessary market signals to ensure that airlines' plans result in the most efficient use of Logan Airport (including smarter use of other regional airports and, for smaller carriers, the use of planes capable of handling more passengers). Massport shares this responsibility with the airlines. Such an evaluation should include an appropriate sensitivity analysis to help determine the operations/hour level where peak period pricing becomes effective. 6.22

According to the DEIS, Massport appears willing to consider peak period pricing only when Logan actually experiences over scheduling. For this measure, Massport is prepared to wait and see if peak period pricing is necessary. On the other hand, the DEIS details Massport's argument that it needs a new runway now, despite the exponential growth in passenger traffic through Green and Manchester. Following such logic, EPA questions why Massport doesn't wait on its 6.23

decision to construct a new runway until it is clear whether the region really needs an expanded Logan, thereby giving the regional airports a chance to capture more traffic, consistent with the impressive gains made at Manchester and Green.

Additional delay reduction benefits may be obtained from managing/prioritizing takeoffs so that large planes with more passengers are given preference over smaller planes during peak periods of delay. Such a change may help to shift the market to fewer larger planes making fewer flights or scheduling changes by smaller planes to avoid periods of peak operation prone to delay. 6.24

Finally, the proposed project offers only short term relief (five years) for delay problems it is intended to resolve. Massport should extend the planning horizon for the analysis (currently only at ten years) as part of supplemental efforts to investigate longer term solutions. The solutions should actively integrate Logan operations with regional transportation planning (airside and landside integration). 6.25

Air Quality Analysis

General: Because of the substantial growth in operations at Logan Airport, the DEIS generally reflects no significant improvements in air quality attributable to the Airport. Under the future scenarios for the year 2010 evaluated in the DEIS, the number of passengers are forecast to increase from 1998's 26.5 million passengers to 37.5 or 45 million passengers. More significantly, aircraft operations are forecasted to increase from 1998's 507,000 to between 543,000 and 656,000 operations. Increases in aircraft operations projected in the DEIS will result in additional air pollution, offsetting the anticipated benefits of lower-emitting aircraft and other airport-related vehicles. Despite reductions in emissions from individual aircraft, ground vehicles, and passenger cars as a result of tighter emission standards and fleet turnover, the DEIS finds that emissions of nitrogen oxides (NO_X), volatile organic compounds (VOC) and carbon monoxide (CO) will remain roughly the same or increase slightly by 2010. Because of the increase in aircraft operations, the affected communities will not share in the full benefits of lower emission levels from many of the individual sources of pollution.

The DEIS's conclusion that the preferred alternative will have the least negative air quality impacts is a result of certain questionable assumptions. The DEIS finds that the preferred alternative (taxiway improvements and Runway 14/32) will result in lower emissions of the pollutants CO, VOCs, and NO_X than any of the other alternatives, including the no action alternative. The air quality analysis assumes that the airport-related motor vehicle emissions and the number of flight operations will be identical for all the alternatives. The only variables among the alternatives are emissions attributable to airside delays. Consequently, the preferred alternative, which results in the least delays, inevitably has fewer emissions. 6.26

Unfortunately, these assumptions underlying the air quality analysis ignore the possibility that certain alternatives may result in more passengers or more flight operations. If the airport increases its airside efficiency and reduces delays, it is plausible that airlines will choose to increase flights to Logan (as opposed to regional airports such as Manchester, Green or Worcester). Without an analysis of whether an additional runway will affect future growth of

flight operations, the validity of the air quality conclusions (that Runway 14/32 and taxiway improvements will result in fewer emissions than the alternatives) are questionable. The DEIS should have analyzed whether increased airside efficiency affects the number of flight operations in the future. If the answer is yes, the air quality analysis should be structured in a way to discern the true comparative impacts of each alternative.

Additional Technical Air Analysis Comments:

National Ambient Air Quality Standard (NAAQS) for Fine Particulate Matter: Table 5.3-1 reflects the current NAAQS for criteria pollutants. However, the table contains the incorrect 24-hour NAAQS for fine particulate matter. Rather than 50 ug/m, the standard is 65 ug/m. (Note: While EPA proposed a 24-hour standard of 50, the final standard was set at 65 ug/m.) 6.27

Use of Revised Ozone Standard: In Section 5.3.1.2 (page 5-41 and 42), the Draft EIS/R reflects ambient levels of criteria air pollutants measured at the three closest Massachusetts DEP monitoring stations. These levels are reflected in Table 5.3-2. The Draft EIS/R compares these ambient levels with the one-hour ground-level ozone standard of 0.12 part per million (ppm). In July 1997, EPA revised its ozone standard to an eight-hour standard of 0.08 ppm. The DEIS should use this more stringent standard as the point of comparison. 6.28

Environmental Justice

Federal Environmental Justice Policy

The DEIS does not satisfy either the stated intent or the specific directives of the federal environmental justice policy. The obligations of the FAA to address environmental justice issues are grounded in at least three separate mandates: 1. Executive Order 12898 Federal Actions to Address Environmental Justice in Minority Populations and Low-income Populations; 2. Department of Transportation Order on Actions to Address Environmental Justice in Minority Populations and Low-income Populations; and 3. Environmental Justice Guidance under the National Environmental Policy Act issued by the Council on Environmental Quality. In developing a DEIS, these documents direct FAA to

- collect and analyze data relevant to environmental justice issues,
- analyze adverse impacts,
- explore issues of cumulative exposure,
- examine public health issues,
- look broadly at interrelated social, cultural, and economic effects, and
- develop strategies for meaningful public participation.

The Executive Order: Under the Executive Order, Federal agencies should identify and address disproportionately high and adverse human health or environmental effects of their activities on minority and low-income populations, and provide meaningful public participation in meeting that objective. The Executive Order articulates two requirements regarding the need to develop data that can be used to perform relevant analysis in the NEPA context. First, each federal

agency should collect, maintain, and analyze information assessing and comparing environmental and human health risks borne by populations identified by race, national origin, or income. An agency then should use that information to determine whether its programs, policies, and activities have disproportionately high and adverse human health or environmental effects on minority and low-income populations. Second, each federal agency should collect, maintain, and analyze information on the race, national origin, and income level for areas surrounding facilities expected to have substantial environmental, human health, or economic effects on the surrounding populations.

The DOT Order: Under the DOT Order, activities – including planning activities – with the *potential* to have disproportionately high and adverse effects[1] on human health or the environment are sufficient to trigger the need to consider effects on minority and low-income populations.

Further, the DOT Order explicitly addresses the issue of preventing disproportional and high adverse impacts. In that context, it directs DOT to administer its programs in a manner consistent with requirements under NEPA so as to identify the risk of discrimination early in the program or policy development process. In implementing the requirements under NEPA, the Agency is directed to obtain the following information:

- population served and/or affected by race, color or national origin, and income level;
- proposed steps to guard against disproportionately high and adverse effects on the basis of race, color, or national origin; and
- present and proposed membership by race, color, or national origin in any

---

[1]The DOT Order defines adverse effects very broadly. Adverse effects are the totality of significant individual or cumulative human health or environmental effects including interrelated social and economic effects which may include but are not limited to

- bodily impairment, infirmity, illness or death
- air, noise, and water pollution and soil contamination
- destruction or disruption of man-made or natural resources
- destruction or diminution of aesthetic values
- destruction or disruption of community cohesion or a community's economic vitality
- destruction or disruption of the availability of public and private facilities and services
- vibration
- adverse employment effects
- displacement of persons, businesses, farms, or nonprofit organizations
- increased traffic congestion, isolation, exclusion or separation of minority or low-income individuals within a given community or from the broader community
- denial of, reduction in, or significant delay in the receipt of benefits of DOT programs, policies, or activities

planning or advisory body.

In addition, the DOT Order identifies actions to address disproportionately high and adverse effects. DOT agencies are directed to ensure that programs and policies having disproportionately high and adverse effects on minority or low-income populations will only be carried out if further mitigation measures or alternatives avoiding or reducing those effects are not practicable. In determining practicability, the social, economic, and environmental effects of the mitigation will be taken into account.

Finally, the DOT Order contemplates meaningful opportunities for public involvement by minority and low-income communities during the planning and development of DOT activities. Specifically, the agency is to provide the public information addressing the concerns of minority and low-income populations regarding health and environmental impacts.

CEQ Guidance: The CEQ guidance defines key terms in Executive Order 12898.[2] CEQ recommends that the additional guidance be applied with flexibility and that its defined terms be considered "a point of departure rather than conclusive direction in applying the terms of the Executive Order."

The CEQ guidance clearly states that environmental justice principles are "wholly consistent with the purposes and policies of NEPA." Although there is no standard formula for identifying environmental justice issues in NEPA reviews, agencies are expected to address the issues in a clear, concise, and comprehensible manner. In particular, agencies should consider

- public health data and industry data concerning the *potential for multiple or cumulative exposure* to health or environmental hazards in the affected population *even if the effects of such exposure are not within the control or subject to the discretion of the agency proposing the action*,
- historical patterns of exposure to environmental hazards, and
- interrelated cultural, social, occupational, historical, or economic factors that may amplify natural and physical environmental effects (such factors should include the physical sensitivity of the community to particular impacts, the effect of any disruption on community structure, and the nature and degree of the impact on the physical and social structure of the community).

Because environmental justice issues may arise at any point in the NEPA process, CEQ encourages agencies to consider those issues "at each and every step of the process."

---

[2]The defined terms include: low-income population, minority, minority population, disproportionately high and adverse human health effects, disproportionately high and adverse environmental effects.

At the outset, in the scoping phase of the NEPA process, agencies should determine the demographics of the affected area.

In the alternatives phase, if the agency has concluded that a disproportionately high and adverse health or environmental impact on minority or low-income populations will result from the proposed action or alternatives, CEQ directs the agency to consider the distribution as well as the magnitude of the disproportionate impacts. In weighing that factor, the agency should consider input from the affected community as well as the magnitude of the impacts associated with alternatives having less disproportionate adverse effects on minority or low-income populations.

In the analysis phase, after identifying a disproportionately high and adverse health or environmental effect on a minority or low-income population, CEQ directs agencies to analyze how such effects are distributed within the affected community. CEQ recommends that any available data be displayed spatially so that the public can see the distribution of health and environmental impacts among the demographic population groups. The display should be modified to reflect any additional qualitative or quantitative information obtained through the public participation process.

If an agency has identified potential environmental justice issues, the agency is directed to state clearly and concisely in the DEIS whether a disproportionately high and adverse health or environmental impact on minority and low-income populations is likely to result from the proposed action. The Agency should cite specific information so that the public can understand the rationale for the agency's conclusion.

Agencies also are directed to develop effective public participation strategies including active outreach to affected groups and to assure meaningful community representation as early as possible at all stages of the process.

FAA Compliance with Federal Environmental Justice Policy

As stated previously, the DEIS does not satisfy either the intent or the specific directives of the federal government's environmental justice policy as expressed in the Executive Order, the DOT Order, and the CEQ Guidance. The DEIS does not demonstrate an effort to implement that policy proactively. Despite CEQ's statement that its guidance should be applied with flexibility, the DEIS uses extremely narrow definitions of low-income and minority populations. Use of such narrow definitions allows the FAA to conclude that there are no environmental justice issues because so few people fall within the narrowly defined categories. Major deficiencies in the DEIS are identified below. 6.29

<u>Data Collection and Analysis</u>: The DEIS presents no detailed demographic data for the communities surrounding Logan Airport nor does it identify the impacted community with any geographic precision . The impacted community is only identified by noise contours presented on a very small-scale map. There is no expianation regarding the issues considered in identifying the study area. There is no map clearly indicating the location of the study area. 6.30

Although required by the DOT Final Order, the DEIS does not define the populations served or affected by race, color, national origin, and income level. Table 8.7-1 is the only table presented in the environmental justice analysis. That table does not clearly indicate where the noise-exposed population is located, nor does it provide any detail in describing the demographics of that population. It is impossible for any individual citizen to tell from the table whether he or she is in the noise exposed population. In addition, none of the information is mapped so that the public can see the distribution of health and environmental impacts across population groups. 6.31

Adverse Impacts: Contrary to the requirements of the Executive Order and the DOT Order, the DEIS presents little data and analysis on a broad range of potential adverse impacts. Because the environmental justice analysis in the report is brief and provides little basis for its conclusion that noise is the only adverse impact, especially in the context of cumulative impacts, it is impossible to review the rationale or data used in reaching that conclusion. Ironically, that is just the circumstance that federal environmental justice policy is intended to remedy. 6.32

Cumulative Exposure: The CEQ Guidance directs agencies to consider the potential for multiple or cumulative exposure to health and environmental hazards even if the effects of the cumulative exposure are not within the control of the agency action. The DEIS offers no information regarding the health of the communities surrounding Logan. There is no mention of historical patterns of exposure to environmental hazards. There is no meaningful discussion of multiple or cumulative exposure. And there is no opportunity to review the conclusions regarding cumulative exposure in the DEIS since there is no detailed description of other sources to which low-income and minority communities surrounding Logan are exposed. EPA understands that, for purposes of determining eligibility of homes for soundproofing, FAA may only rely on noise generated by aircraft operations. However, in preparing the environmental justice portion of the DEIS, the cumulative noise impacts from all sources in affected neighborhoods is a critical consideration. 6.33

Health Issues: Despite the requirement in the Executive Order, the DOT Order, and the CEQ Guidance that public health issues be examined, there is no discussion of the public health issues often raised by minority and low-income communities, such as asthma, respiratory distress, or attention deficit disorder. Most remarkably, there is no discussion of hearing loss, an obvious health concern to any population exposed to excessive noise. Without any discussion of baseline health conditions, it is impossible to evaluate the incremental impacts or risk associated with the proposed agency action. 6.34

Social, Cultural, and Economic Factors: Although it is required by the CEQ Guidance, there is no discussion of interrelated social, cultural, occupational, historical, and economic factors that may increase the environmental effects of the proposed action. The DEIS does not address factors seemingly relevant at Logan Airport, including the physical sensitivity of the community to specific impacts, the effect of any disruption on community structure, and the nature of the impact on the physical and social structure of the community. For example, the DEIS appears to assume that soundproofing completely addresses noise impacts in a neighborhood. There is no mention that over-flights impair residents' use of their porches or yards. Double-pane windows cannot protect the conversations on the street and front stoop that bind a community together. 6.35

Public Participation: Rather than responding directly to community concerns, the FAA instead often focuses on its compliance with process requirements. Many substantive issues were raised in comments on the scoping document. Often the response to those comments merely noted the public participation process without responding substantively in a manner indicating that the comment was considered carefully. EPA understands that Massport did have a series of meetings several years ago on these airside improvements. However, several community groups and members of Logan's Citizens Advisory Council complained to EPA that Massport and FAA failed to respond to specific requests made from October 1997 to late 1998 to engage in a concrete discussion with the community about plans for air side improvements at Logan, and that when the consultation did resume, it was just before release of the DEIS. Community input during this final decision-making period would have been particularly appropriate. 6.36

Noise Analysis

General Comments: It remains unclear how Massport and the FAA will be able to comprehensively "guarantee" unidirectional use (over the harbor only) of Runway 14/32. Without such a guarantee, it is uncertain whether assumptions about noise impacts from runway 14/32 accurately characterize future conditions. The EIS argues that the proposed new runway will help Logan to attain PRAS goals. There are two problems with this premise. First, based on the recent public debate concerning PRAS goals, it is not evident that these goals reflect current community interests. Second, the focus on PRAS goals as a benefit of the proposed runway inappropriately shifts the focus away from consideration of alternatives to reduce use of Logan (or air travel for that matter) as a means to eliminate delay. Asserting that the FAA will be able to distribute noise impacts more flexibly across impacted communities does nothing to address the question of whether those noise impacts are necessary or adequately mitigated. 6.37 6.38

Technical Comments

1. Use of 1993 as Base Year: The use of 1993 as the base year is not appropriate. In general, the normal airport analysis starts with a base year that represents the current situation. Clearly, the use of 1993 data does not provide the reader with the current situation, particularly as it relates to aircraft type, aircraft operations, population and residences. While it maybe true that the1993 noise impacts were a "worst case" due to the large number of stage 2 aircraft, we do not believe that it represents the current situation. Moreover, the comparison of the alternatives with a particularly high noise year may serve to minimize what might otherwise be significant changes from the current 1999 level of noise experienced by nearby community residents. For historic purposes it may be of some use, but it should not replace the current (base) situation. Since the EIS references the fact that newer information exists (see page 5-32, "1997 Annual Update for 1997 contours"), it is unclear why at the very least 1997 was not used as the base/current year. 6.39

In addition, the EIS indicates that the noise model used 1990 Census Tiger Files to predict the populations levels in the noise contours for the 1993 noise contours. We recommend that the document provide appropriate justification that 1990 population data is appropriate for use in 6.40

1993 without the use of any adjustment. It is also not clear what census data was used for modeling 1999 and 2010 years.

2. **Use of 1999 as Operational Year:** The use of 1999 as the runway operational year is not appropriate since the new runway will not be operational this year. Therefore, we recommend that FAA provide additional new runway operational year modeling. 6.41

3. **Noise Contour Maps:** Various maps in the noise analysis need to be supplemented. Specifically:

- While the "satellite view" contour maps are useful, there is a need for contour maps that have far greater detail. The contour maps in appendix L are better, but even those are not of the scale that we expect to see in FAA NEPA documents. It is likely that these maps will need to be of the fold out variety in order to show the appropriate scale; 6.42
- Detailed land use maps in color with noise contour overlays should also be provided. The actual land use as it relates to local zoning should be discussed in the appropriate sections of the document. These maps should be of the same scale as the as the new contour map requested above;
- To enhance the discussion related to reduction of the 70 and 75 dBA contour areas and the slight increase the 65 dBA contour, we recommend supplemental maps be provided (with possible use of color) that clearly highlight were these changes occur.

4. **Airport Layout Map:** Since the basic FAA action is the approval of the modified Airport Layout Plan, the document should contain a copy of both the existing and proposed Airport Layout Plan (an appropriate scale will probably require the use of a fold out maps). 6.43

5. **Greater Detail in Operation and Fleet Mix Information:** Detailed operation and fleet mix tables need to be provided for all modeled years. These tables should show: aircraft type, average daily operations, arrivals day, arrivals night, departure day and departure night. These data should match the input data used in the INN. The new tables should be sub-classed by commercial, commuter/air taxi, military and general aviation operations. 6.44

6. **Discussion of 60 dBA Contours:** Although the 60 dBA contours in the technical appendices do provide additional information, this information should be provided in the main volume of the EIS. We recommend that FAA show and discuss any areas within the 60 dBA contour that would experience a 3 dBA increase in accordance with the 1992 FICON guidance. 6.45

7. **Detailed Grid Point SEL Data:** While the noise analysis does provide some Lmax data, we recommend that this information be supplemented with detailed grid point SEL data for selected representative sites. 6.46

Construction Mitigation

The DEIS identifies several construction period mitigation measures, including the suppression of fugitive dust. Massport should commit to mitigative measures to control emissions from the heavy-duty engine construction equipment involved in any airport improvements. An excellent model for such mitigation is the Central Artery/Tunnel's Clean Air Construction project, a project spearheaded jointly by EPA-New England, several Massachusetts state offices, the Northeast States for Coordinated Air Use Management (NESCAUM) and the Manufacturers of Emission Control Association. Under the Clean Air Construction project, seventy construction machines (including front end loaders, backhoes, excavators, cranes and air compressors) have been retrofitted with pollution control devices (oxidation catalysts or particulate filters) in order to reduce particulate matter, hydrocarbons, carbon monoxide and toxics. In its construction contracts, Massport should require contractors to participate in this program of retrofitting construction equipment. More information on this construction initiative can be found at NESCAUM's website www.nescaum.org. 6.47

Rating

For the reasons discussed above, EPA has rated this EIS "Environmental Objections; Insufficient Information" in accordance with EPA's national rating system, a description of which is attached.

DEFINITIONS AND FOLLOW-UP ACTION

Environmental Impact of the Action

LO--Lack of Objections
The EPA review has not identified any potential impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC--Environmental Concerns
The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

EO--Environmental Objections
The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU--Environmentally Unsatisfactory
The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

Adequacy of the Impact Statement

Category 1--Adequate
EPA believes that draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2--Insufficient Information
The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category 3--Inadequate
EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Letter 6
US Environmental Protection Agency, Region 1
John P. DeVillars, Regional Administrator

Code	Topic 1	Topic 2	Comment	Response
6.1	Noise	Soundproofing	...while the DEIS promises as mitigation the soundproofing of all homes newly exposed to high levels of aircraft noise as a result of the proposed project, there remains uncertainty as to whether the mitigation covers enough homes, and whether Massport and FAA will have adequate funding to carry out this commitment.	The mitigation program will include all residences impacted through implementation of the Preferred Alternative. Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country that received FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences.
6.2	Ground Transportation	Mitigation	...commitments for improvements to the Blue Line Station at Logan...have not been kept.	The MBTA is developing a new Logan Airport Station to be located about 400 feet north of the existing Logan Airport Station. Massport is consulting with the MBTA on the project's design and operational elements. The new Logan Airport Station will include modern passenger amenities such as wide escalators, oversized elevators, and real-time flight information displays in the station lobby. It will also provide a convenient at-grade connection to the neighborhood, AITC Blue Route and Logan Airport, and may become a stop on the MBTA's proposed Circumferential Transit (Urban Ring) service. The Airport Station project has been the subject of EIS review and is proceeding as approved in the FHWA-CA/T review process.

Code	Topic 1	Topic 2	Comment	Response
6.3	Environmental Justice	Demographic Data	The analytic basis for...[FAA's and Massport's conclusion that minority and low-income communities do not experience disproportionately high impacts] is insufficient since critical demographic and other relevant health data are missing.	The Supplemental DEIS/FEIR provides detailed analysis of environmental justice requirements. Refer to Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population in the 65 dB DNL and above contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.
6.4	Environmental Justice	Demographic Data	...the DEIS does not compare the demographics of communities served by this project to the demographics of communities bearing the burden of the project's impacts.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a detailed discussion of the Environmental Justice analysis. The analysis provides for an appropriate comparison of the alternatives. The analysis covers all the requirements of Executive Order 12898, U.S. DOT implementing regulations, and FAA policy. The Environmental Justice analyzes the demographics of those that bear the impact within the 65 DNL contour to the population that gets the benefit of the project, which is Suffolk County.
6.5	Environmental Justice	Impacts	...the environmental justice analysis in the DEIS focuses solely on noise and ignore credible public comments identifying air quality, odor, traffic and other impacts that cumulatively burden surrounding communities with high percentage of low-income and minority populations.	Noise was identified as the only off-airport impact associated with the Preferred Alternative with the potential for impacts to environmental justice populations. Because of improved airfield efficiency and shorter delay periods, the Preferred Alternative is projected to slightly reduce emissions of air pollutants when compared to the No Action Alternative. Construction will be managed to minimize air, noise and other impacts to the adjacent communities. All construction vehicles will be required to use designated truck routes and to avoid local streets. Because of the perceived importance of cumulative impacts, Chapter 7 of the Supplemental DEIS/FEIR addresses cumulative impacts.

Code	Topic 1	Topic 2	Comment	Response
6.6	Regional Transportation	Regional Airports	...[T]o increase alternatives to air travel through Logan...[a regional, long-term transportation goal should be to use] T.F. Green in Rhode Island, Worcester Airport in Massachusetts, Manchester Airport in New Hampshire and other regional airports....	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. In addition, FAA AIP funds have been provided since the early 1990s to initiate development of these regional airports. Massport has actively encouraged the development of regional airports and full use of other regional alternatives, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a description of the upcoming New England Airports System Study.
6.7	Regional Transportation	Passenger Rail	[Another regional, long-term transportation goal should be to provide] through intercity high-speed rail connections supported by a North-South Station link.	Massport has actively encouraged regional transportation alternatives to Logan Airport, including rail. Massport supports intercity rail planning through its membership in the Boston Metropolitan Planning Organization (MPO). The MPO is a cooperative planning board whose membership also includes MassHighway, Metropolitan Area Planning Council; MBTA, and MBTA Advisory Board. As members of the MPO, Massport and these agencies are responsible for preparing the *Boston Transportation Improvement Program (TIP)* and the *Transportation Plan for the Boston Region.* In this capacity, Massport influences regional transportation plans for intercity rail. Massport also holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic.
6.8	Ground Transportation	Regional Airports	[Massport, FAA, and other federal and state transportation agencies should] establish efficient mass transit access to and between the regional airports....	Massport supports improved ground access to Worcester Regional, T.F. Green/Providence, Manchester and Logan airports. These projects are discussed in Section 2.9 of the Supplemental DEIS/FEIR.
6.9	Ground Transportation	Access to Logan Airport	[Massport, FAA, and other federal and state transportation agencies should] reduce Logan's traffic impacts on surrounding communities by such measures as a free shuttle service between South Station and Logan, an intermodal terminal at Route 128, and the Urban Ring.	Massport has a comprehensive ground access strategy in place including consideration of promoting HOV use and alternative modes of transportation to Logan Airport. The status of the South Station and Logan Airport link (the Airport Intermodal Transit Connector), an intermodal terminal at Route 128, and the Urban Ring were documented in the *Logan Airport 1999 ESPR* (previously GEIR).

Code	Topic 1	Topic 2	Comment	Response
6.10	Alternatives	Peak Period Pricing	In addition, Massport should reduce the small plane mix from Logan's peak traffic hours through a peak period pricing strategy, implemented with appropriate sensitivity to the needs of communities served exclusively by smaller aircraft.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
6.11	Alternatives	Peak Period Pricing	Additional analysis is critical to determine whether the imposition of peak period pricing now would help send the necessary market signals to ensure that airlines' plans result in the most efficient use of Logan Airport (including smarter use of other regional airports, and, for smaller carriers, the use of planes capable of handling more passengers.	Elements of the PPP monitoring system include periodic review of advance airline schedules, comparisons of projected activity levels to airfield capacity, analysis of resultant levels of delay, discussions with major Logan Airport carriers to allow for voluntary schedule adjustments, and development of an action plan, as described in Section 4.5 of the Supplemental DEIS/FEIR, which would be put into place if overscheduling conditions are not corrected. Results of the monitoring system were reported in filings on an ongoing basis. The Peak Period Monitoring System is described in Section 4.5.4 of the Supplemental DEIS/FEIR.
6.12	Noise	Soundproofing	The affected communities have raised serious and credible concerns about the ability of the computer modeling relied upon in the DEIS to accurately reflect noise levels associated with Logan operations and to select homes eligible for soundproofing. These concerns are based on *in situ* noise monitoring which appears to demonstrate that computer modeling underestimates actual noise levels, at least in some neighborhoods. The DEIS does not properly address this deficiency and thus does not adequately represent the likely actual noise impacts.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Using results from a special study of Terrain Modeling analysis ("hill effects") in Orient Heights and Jeffries Point, Massport applied for and received approval to apply a correction to 1999 contours to account for increased levels in Orient Heights.
6.13	Noise	Impacts	Furthermore, the noise increases to neighborhoods that fall outside the FAA's 65-dBA contour remain inadequately acknowledged and addressed, as do the very high noise levels that occur each time aircraft fly over or by neighborhoods.	Noise exposure is now reported down to DNL values of 60 dB, and expected changes in exposure are reported for several new communities outside the 60 dB DNL contour. For example, refer to Tables 6.2-8 and 6.2-9 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
6.14	Noise	Impacts	The DEIS does not fully disclose the sleep disruption and other impacts that occur in these instances, nor does it address cumulative noise impacts to account for all noise, not just modeled aircraft noise, as is required under NEPA.	The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Tables 6.2.17 and 6.2.18 of the Supplemental DEIS/FEIR report these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4.1 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts.
6.15	Analysis Assumptions/ Methodologies	Base Year	In addition, the use of 1993 is not appropriate as the base year for analysis as it does not represent existing conditions and may minimize the relative noise impacts from the Preferred Alternative when compared with what appears to have been an especially noisy base year.	The Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. The No Action Alternative is the appropriate "base" comparison for assessing future year conditions and the effectiveness of the Airside Project. The Supplemental DEIS/FEIR expands upon the discussion between current and historical conditions and can be found in Section 4.2 of the Supplemental DEIS/FEIR.
6.16	Analysis Assumptions/ Methodologies	Passenger Forecasts	The DEIS analyses ignore the critical question of whether the improvements will spur additional growth at the airport. In comparing the alternatives, both the noise and air quality analyses assume that the future passenger/flight operations growth at Logan will remain constant regardless of whether or not the runway 14/32 is constructed. The analysis thereby avoids any serious consideration of what appears to be one of the most critical questions posed by this project-whether the proposed improvements, especially when combined with landside improvements, cumulatively facilitate future growth in flight operations and passenger traffic with corresponding increases in noise, traffic, and air pollution impacts.	The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in future passenger and aircraft activity at Logan Airport. The environmental impacts associated with these alternative forecasts have been evaluated in the Logan Airport Airside analysis and GEIR/ESPRs. Section 4.2 of the Supplemental DEIS/FEIR includes more detailed discussion.

Code	Topic 1	Topic 2	Comment	Response
6.17	Regional Transportation	Regional Airports	...the scope of the DEIS, with its focus on construction of proposed runway 14/32 and the taxiway improvements, is too limited and fails to seriously consider regional improvements as alternatives to the Logan runway project. As EPA indicated in its previous comments, the DEIS should have identified a targeted regional strategy including both existing and potential capacity, as well as regional pricing and marketing to enhance the capacity and efficiency of, and access to, all New England airports.	The alternatives in the Supplemental DEIS/FEIR respond to state and Federal scoping directives. Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Massport now expects that Logan Airport will not achieve the 37.5 million passenger forecasts until 2015, rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
6.18	Environmental Review Process	FAA/NEPA, MEPA	As EPA indicated in comments on the DEIS scope, the airside and landside projects are functionally linked, and as such, they should be evaluated together in a comprehensive EIS. The current analysis focuses entirely in airside issues with no real analysis of opportunities for Massport to integrate landside and airside planning to enable Logan to improve operations and handle the substantially greater numbers of passenger anticipated for the coming decades. In response to our scoping comments, the DEIS explains that the analysis is based on background planning information provided in the state Generic Environmental Impact Report (GEIR) and that the DEIS is based on the FAA scope which was developed through a public comment process. Unfortunately, our comments on the appropriate scope of analysis for the EIS were largely discounted, and the GEIR, a document prepared under the rules of state law, does not meet the requirements of NEPA. Thus, reliance on the GEIR to satisfy NEPA's requirements for a cumulative impact analysis is not appropriate.	The proposed improvements analyzed in the Supplemental DEIS/FEIR involve both construction and administrative actions that will facilitate aircraft operations (landings, takeoffs and taxiing). None of the improvements involve landside facility improvements (*e.g.*, terminals and roadways) or related operations. The Supplemental DEIS/FEIR analyzes in detail the impacts from aircraft operations, including analysis of noise and air quality impacts during the years 1993, 1998 and under future forecast scenarios as well as environmental benefits from certain of the improvement concepts under review. In this respect, the Supplemental DEIS/FEIR conforms with scoping directives from the lead federal agency (the FAA) and with applicable FAA environmental orders, all issued in accordance with NEPA, and with directives from EOEA issued under MEPA. The various GEIR documents, including the *Logan Airport 1998 Annual Update* and the *1999 Environmental Status and Progress Report* (previously GEIR), provide additional analytic context by examining cumulative impacts from airside (*i.e.*, aircraft) operations and landside (*e.g.*, vehicular traffic, terminal service vehicles) operations at Logan Airport as well as Massport's comprehensive mitigation program. The ESPR/GEIR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR as a background document. Each GEIR/ESPR submission is subject to public review and comment. The *Logan Airport 1998 Annual Update* and the *1999 ESPR* analysis is based on the same forecast levels used in the Supplemental DEIS/FEIR. The GEIR/ESPR informs Massport's planning process for all the improvements at Logan Airport, including the improvements under review in the Supplemental DEIS/FEIR. Consistent with past practice, Massport expects that the FAA will take the GEIR/ESPR analysis into account during its deliberations and ultimate decision on the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
6.19	Ground Transportation	Access to Logan	EPA recommends that, rather than proceeding with the environmental review of the taxiway and runway improvements, Massport and FAA focus instead on establishing a strategy to make Logan Airport a more efficient transportation center with less impact on surrounding communities, by improving mass transit access to the Airport and preventing growth in the number of flight operations.	Massport is constantly striving to make Logan Airport a more efficient airport with less impact on surrounding communities. These efforts include improving mass transit access to Logan Airport. The Airside Project makes Logan Airport more efficient and will not affect vehicle traffic, transit systems or major roadway intersections. The Supplemental DEIS/FEIR discusses all the environmental impacts from the Airside Project. The ESPR/GEIR and its Annual Updates discuss Massport's efforts to lessen Logan Airport's total environmental footprint, especially impacts from ground access. However, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
6.20	Regional Transportation	Passenger Rail	One means to reduce the growth pressures on Logan Airport is to enhance the current intercity transportation options...Massport, in cooperation with EOTC, U.S. DOT, Amtrak, and other transportation agencies, should take active measures to promote high speed rail....	Chapter 2 of the Supplemental DEIS/FEIR provides discussion of the entire region's air transportation system and includes a discussion of alternative modes, specifically, high-speed rail and the extent of Massport's active involvement in this area. Refer to response to Comments 6.6 and 6.7.
6.21	Regional Transportation	Regional Airports	These efforts should not be limited to high speed rail but should also encourage and market the use of other regional airports to the benefit of Logan and surrounding communities.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional alternatives, and steps Massport has taken to foster increased use of these alternatives. Refer to response to Comments 6.6 and 6.7.
6.22	Alternatives	Peak Period Pricing	...the implementation of peak period pricing should be a piece of the regional transportation strategy. The DEIS clearly demonstrates that peak period pricing would serve to lessen delays substantially in the high growth future scenarios... Additional analysis is critical to determine whether the imposition of peak period pricing now would help send the necessary market signals to ensure that airlines' plans result in the most efficient use of Logan Airport...Such an evaluation should include an appropriate sensitivity analysis to help determine the operations/hour level where peak period pricing becomes effective.	Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport. Refer to responses to Comment 6.10 and 6.11.
6.23	Alternatives	Peak Period Pricing	According to the DEIS, Massport appears willing to consider peak period pricing only when Logan actually experiences over scheduling. For this measure, Massport is prepared to wait and see if peak period pricing is necessary. On the other hand, the DEIS details Massport's argument that it needs a new runway now, despite the exponential growth in passenger traffic through Green and Manchester. Following such logic, EPA questions why Massport doesn't wait on its decision to construct a new runway until it is clear whether the region really needs an expanded Logan, thereby giving the regional airports a chance to capture more traffic, consistent with the impressive gains made at Manchester and Green.	Additional analysis of PPP is set out in Section 4.5 the Supplemental DEIS/FEIR The regional airports at Manchester and T.F. Green/Providence have experienced exceptional traffic growth over the past several years. Massport estimates that in 1999 regional airports diverted 2.4 million passengers from Logan Airport. In the future, continued development at the regional airports should relieve some of the traffic growth pressures at Logan Airport, resulting in a reduced rate of traffic growth. Nevertheless, regional alternatives do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Refer to response to Comment 6.17.
6.24	Alternatives	Other Non-Construction Alternatives	Additional delay reduction benefits may be obtained from managing/prioritizing takeoffs so the large planes with more passengers are given preference over smaller planes during peak periods of delay.	Although prioritizing takeoffs based on aircraft size might reduce delays, the air traffic control system of the United States, which the FAA operates, is based on a first-come, first-serve policy under most circumstances. Any change in this policy would require a major federal decision and would involve significant implications within the entire air traffic control system.

Code	Topic 1	Topic 2	Comment	Response
6.25	Analysis Assumptions/ Methodologies	Planning Period	...the proposed project offers only short term relief (five years) for delay problems it is intended to resolve. Massport should extend the planning horizon for the analysis (currently only at ten years) as part of supplemental efforts to investigate longer term solutions. The solutions should actively integrate Logan operations with regional transportation planning (airside and landside integration).	The airside analysis demonstrates that the delay reduction benefits of proposed Runway 14/32 and the other recommended airside improvements increase in the future, from 43,000 annual hours of delay reduction under the 29 M Low Fleet scenario up to 78,000 hours under the 37.5 M passenger Low Fleet scenario. Delay and environmental impacts of the Airside Project were evaluated under a broad range of future operating conditions at Logan Airport. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Airside Project Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Chapter 2 of the Supplemental DEIS/FEIR addresses the integration of the Airside Project and regional transportation.
6.26	Air Quality	Model	The DEIS's conclusion that the Preferred Alternative will have the least negative air quality impacts is a result of certain questionable assumptions. The air quality analysis assumes that the airport-related motor vehicle emissions and the number of flight operations will be identical for all the alternatives. Unfortunately, these assumptions underlying the air quality analysis ignore the possibility that certain alternatives may result in more passengers or more flight operations. Without an analysis of whether an additional runway will affect future growth of flight operations, the validity of the air quality conclusions...are questionable. The DEIS should have analyzed whether increased airside efficiency affects the number of flight operations in the future. If the answer is yes, the air quality analysis should be structured in a way to discern the true comparative impacts of each alternative.	Refer to first paragraph in response to Comment 6.16. The air quality analysis was based on facts, findings, and assumptions that best characterize operational conditions at Logan Airport under future alternative growth and development scenarios. The basis for these scenarios and corresponding conditions is presented in Section 5.4 of the Supplemental DEIS/FEIR.
6.27	Air Quality	NAAQS	Table 5.3-1 reflects the current NAAQS for criteria pollutants. However, the table contains the incorrect 24-hour NAAQS for fine particulate matter. Rather than 50 ug/m, the standard is 65 ug/m.	Table 5.4-2 of the Supplemental DEIS/FEIR has been corrected to indicate that the 24 hour standard for fine particulate matter is 65 micrograms per cubic meter.
6.28	Air Quality	NAAQS	In Section 5.3.1.2 (page 5-41 and 42), the Draft EIS/R reflects ambient levels of criteria air pollutants measured at the three closest Massachusetts DEP monitoring stations. These levels are reflected in Table 5.3-2. The Draft EIS/R compares these ambient levels with the one-hour ground-level ozone standard of 0.12 parts per million (ppm). In July 1997, EPA revised its ozone standard to an eight-hour standard of 0.08 ppm. The DEIS should use this more stringent standard as the point of comparison.	During the time that the analysis was conducted for the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR no definitive standard was in affect because of court challenges. The one-hour standard was applied in the Airside Project Draft EIS/EIR analysis. The available monitoring data for ozone eight-hour averages are now included in Section 5.4 of the Supplemental DEIS/FEIR. The eight-hour data are unavailable for years before 1995.

Code	Topic 1	Topic 2	Comment	Response
6.29	Environmental Justice	Demographic Data	...the DEIS does not satisfy either the intent or the specific directives of the federal government's environmental justice policy as expressed in the Executive Order, the DOT Order, and the CEQ Guidance. Despite CEQs statement that its guidance should be applied with flexibility, the DEIS uses extremely narrow definitions of low-income and minority populations. Use of such narrow definitions allows the FAA to conclude that there are no environmental justice issues because so few people fall within the narrowly defined categories.	Low income and minority populations were defined in accordance with Federal Executive Order 12898, the United States DOT Final Order, the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively.
6.30	Environmental Justice	Demographic Data	The DEIS presents no detailed demographic data for the communities surrounding Logan Airport nor does it identify the impacted community with any geographic precision. The impacted community is only identified by noise contours presented on a very small-scale map. There is no map clearly indicating the location of the study area.	Refer to new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
6.31	Environmental Justice	Demographic Data	Although required by the DOT Final Order, the DEIS does not define the populations served or affected by race, color, national origin, and income level. Table 8.7-1 is the only table presented in the environmental justice analysis. That table does not clearly indicate where the noise-exposed population is located, nor does it provide any detail in describing the demographics of that population. It is impossible for *any* individual citizen to tell from the table whether he or she is in the noise-exposed population. In addition, none of the information is mapped so that the public can see the distribution of health and environmental impacts across population groups.	The estimated population within the 65 dB and 60 dB DNL noise contours for the No Action and Preferred Alternatives is presented for each of the communities within the study area in Tables 6.8-6 through 6.8-10 of the Supplemental DEIS/FEIR. Figures 6.8.1 and 6.8.2 of the Supplemental DEIS/FEIR provide information on the distribution of median household income and minority populations within the study area. Refer to new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
6.32	Environmental Justice	Impacts	...DEIS presents little data and analysis on a broad range of potential adverse impacts. Because the environmental justice analysis in the report is brief and provides little basis for its conclusion that noise is the only adverse impact, especially in the context of cumulative impacts, it is impossible to review the rationale or data used in reaching that conclusion. Ironically, that is just the circumstance that federal environmental justice policy is intended to remedy.	The Supplemental DEIS/FEIR contains an expanded analysis of Environmental Justice considerations. Noise was identified as the only off-airport impact from the Preferred Alternative with the potential for environmental justice impacts. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. However, because the area added to the 65 dB DNL contour is primarily within the City of Chelsea, other environmental and health issues were also considered in an effort to assess other cumulative or multiple adverse exposures. Refer to Section 6.8.6 of the Supplemental DEIS/FEIR for additional information.
6.33	Environmental Justice	Impacts	The CEQ Guidance directs agencies to consider the potential for multiple or cumulative exposure to health and environmental hazards even if the effects of the cumulative exposure are not within the control of the agency action. The DEIS offers no information regarding the health of the communities surrounding Logan. EPA understands that, for purposes of determining eligibility of homes for soundproofing, FAA may only rely on noise, generated by aircraft operations. However, in preparing the environmental justice portion of the DEIS, the cumulative noise impacts from all sources in affected neighborhoods is a critical consideration.	The Environmental Justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. The analysis showed some increase in population within the 65 dB contours primarily in the City of Chelsea if the Preferred Alternative is implemented. Environmental and health issues within the City of Chelsea were considered in an effort to assess other cumulative or multiple adverse exposures. Refer to Section 6.8.6 of the Supplemental DEIS/FEIR for additional information. Available public health studies for Boston, Winthrop and Revere were also reviewed and are presented in Section 6.8.7 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
6.34	Environmental Justice	Impacts	...there is no discussion of the public health issues often raised by minority and low-income communities, such as asthma, respiratory distress, or attention deficit disorder. Most remarkably, there is no discussion of hearing loss, an obvious health concern to any population exposed to excessive noise. Without any discussion of baseline health conditions, it is impossible to evaluate the incremental impacts or risk associated with the proposed agency action.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
6.35	Environmental Justice	Impacts	...there is no discussion of interrelated social, cultural, occupational, historical, and economic factors that may increase the environmental effects of the proposed action. For example, the DEIS appears to assume that soundproofing completely addresses noise impacts in a neighborhood. There is no mention that over-flights impair residents" use of their porches or yards. Double-pane windows cannot protect the conversations on the street and front stoop that bind a community together.	Environmental and health studies relating to the City of Chelsea were reviewed to assess the potential for other cumulative or multiple adverse exposures, since the increase in population within the 65 dB DNL contour associated with the Preferred Alternative is primarily within this community. While it is true that sound insulation does not alleviate noise exposure outside, it is an effective technique that has been implemented effectively, not only at Logan Airport, but also at numerous other airports throughout the United States.
6.36	Environmental Review Process	Public Participation	Rather than responding directly to community concerns, the FAA instead often focuses on its compliance with process requirements...several community groups and members of Logan's Citizens Advisory Council complained to EPA that Massport and FAA failed to respond to specific requests made from October 1997 to late 1998 to engage in a concrete discussion with the community about plans for air side improvements at Logan, and that when the consultation did resume, it was just before release of the DEIS.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
6.37	Alternatives	Runway 14/32	It remains unclear how Massport and the FAA will be able to comprehensively "guarantee" unidirectional use (over the harbor only) of Runway 14/32.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32. Refer to Section 8.5 of the Supplemental DEIS/FEIR for a discussion of enforcement of the unidirectional limitation.
6.38	Noise	PRAS	...based on the recent public debate concerning PRAS goals, it is not evident that these goals reflect current community interests...the focus on PRAS goals as a benefit of the proposed runway inappropriately shifts the focus away from consideration of alternatives to reduce use of Logan (or air travel for that matter) as a means to eliminate delay. Asserting that the FAA will be able to distribute noise impacts more flexibly across impacted communities does nothing to address the question of whether those noise impacts are necessary or adequately mitigated.	The Supplemental DEIS/FEIR demonstrates that there have been no significant demographic changes to warrant an update of the PRAS goals. Massport does not have control of air travel demand, and continued economic prosperity will inevitably produce more demand for air travel. The Preferred Alternative mitigation program includes several new elements, including sound insulation, an expanded PRAS monitoring and reporting system, and implementation of an expanded PPP monitoring system. Construction of Runway 14/32 would allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.

Code	Topic 1	Topic 2	Comment	Response
6.39	Analysis Assumptions/ Methodologies	Base Year	The use of 1993 as the base year is not appropriate. While it may be true that the 1993 noise impacts were a "worst case" due to the large number of Stage 2 aircraft, we do not believe that it represents the current situation. Moreover, the comparison of the alternatives with a particularly high noise year may serve to minimize what might otherwise be significant, changes from the current 1999 level of noise experienced by nearby community residents. Since the EIS references the fact that newer information exists (see page 5-32, " 1997 Annual Update for 1997 contours"), it is unclear why at the very least 1997 was not used as the base/current year.	Refer to response to Comment 6.15.
6.40	Analysis Assumptions/ Methodologies	Base Year	...the EIS indicates that the noise model used 1990 Census Tiger Files to predict the populations levels in the noise contours for the 1993 noise contours. We recommend that the document provide appropriate justification that 1990 population data is appropriate for use in 1993 without the use of any adjustment. It is also not clear what census data was used for modeling 1999 and 2010 years.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR used 1990 federal census data at the "block" level for all analysis years, which represents the most recent, detailed level of population data available. Estimates of 1995 population for the municipalities adjacent to Logan Airport, developed by the Massachusetts Institute for Social Research, indicate that the population is relatively stable. The 1995 population estimates are not available at a block group level. Refer to Section 6.8.3 of the Supplemental DEIS/FEIR for additional discussion.
6.41	Analysis Assumptions/ Methodologies	Base Year	The use of 1999 as the runway operational year is not appropriate since the new runway will not be operational this year. Therefore, we recommend that FAA provide additional new runway operational year modeling.	Massport and the FAA examined a wide range of future forecast levels in the Airside Project analysis. Logan Airport's rate of growth has slowed partially because of the emerging role of the alternative airports in serving the region's air travel demand. Logan Airport is not expected to reach the traffic level associated with the 29 million passenger scenario until 2003, about the time the runway will be operational. Thus, the runway operational analyses for the 29 million passenger scenario are valid.
6.42	Noise	Studies	Various maps in the noise analysis need to be supplemented. Specifically: While the "satellite view" contour maps are useful, there is a need for contour maps that have far greater detail. The contour maps in appendix L are better, but even those are not of the scale that we expect to see in FAA NEPA documents. It is likely that these maps will need to be of the fold out variety in order to show the appropriate scale; Detailed land use maps in color with noise contour overlays should also be provided. The actual land use as it relates to local zoning should *be* discussed in the appropriate sections of the document. These maps should be of the same scale as the as the new contour map requested...To enhance the discussion related to reduction of the 70 and 75 dBA contour areas and the slight increase the 65 dBA contour, we recommend supplemental maps be provided (with possible use of color) that clearly highlight were these changes occur.	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
6.43	Environmental Review Process	FAA/NEPA	Since the basic FAA action is the approval of the modified Airport Layout Plan, the document should contain a copy of both the existing and proposed Airport Layout Plan....	Figures 3.1-1 and 3.1-2 of the Supplemental DEIS/FEIR show the existing and proposed airside features. The cover of the Airside Project Draft EIS/EIR also presents the existing and proposed layout. Modifications to the Airport Layout Plan are effective upon FAA approval.
6.44	Noise	Model	Detailed operation and fleet mix tables need to be provided for all modeled years. These tables should show: aircraft type, average daily operations, arrivals day, arrivals night, departure day and departure night. These data should match the input data used in the INM. The new tables should be sub-classed by commercial, commuter/air taxi, military and general aviation operations.	Detailed data on each of the fleet mixes that were under consideration may be found in Volume 3, Appendices E and H of the DEIS/EIR. Additional tables in Appendix E of the Supplemental DEIS/FEIR provide data on operations and runway usage used in the analyses of the High Regional Jet Fleet.

Code	Topic 1	Topic 2	Comment	Response
6.45	Noise	Impacts	Although the 60 dBA contours in the technical appendices do provide additional information, this information should be provided in the main volume of the EIS. We recommend that FAA show and discuss any areas within the 60 dBA contour that would experience a 3 dBA increase in accordance with the 1992 FICON guidance.	Refer to Section 6.2.3 and Tables 6.2-6 through 6.2-10 of the Supplemental DEIS/FEIR.
6.46	Noise	Impacts	While the noise analysis does provide some Lmax data, we recommend that this information be supplemented with detailed grid point SEL data for selected representative sites.	SEL and L_{max} are both indicators of noise from a single event and are directly correlated with each other, SELs being approximately 10 dB higher in value for a given aircraft overflight. This is because the SEL is integrated over time while L_{max} is an instantaneous sound level. Because of this relationship, tabulating SELs provides no additional information with which to compare alternatives. For example, in Table 6.2-18 in the Draft EIS/EIR, the first line of data reported for Site 1 on Andrews Street in South Boston shows no difference between Alternatives 1 and 1A, regardless which fleet is considered. SELs would also show no difference. At Site 3, where the L_{max} decreases between Alternatives 1 and 1A, a comparable table of SELs would show a decrease of almost identical magnitude. As the Airside Project Draft EIS/EIR indicates, "these L_{max} [or SEL] values are not as useful for assessing the relative noise among various locations and fleets as are the cumulative metrics such as DNL because they represent extreme values...and they do not consider how often the noise events occur."
6.47	Construction	Mitigation	Massport should commit to mitigative measures to control emissions from the heavy-duty engine construction equipment involved in any airport improvements. In its construction contracts, Massport should require contractors to participate in this program of retrofitting construction equipment.	Massport will require contractors to retrofit their heavy construction equipment with advanced pollution control devices in accordance with DEP's Clean Air Construction Initiative. Contractor owned equipment, such as front-end loaders, backhoes, cranes and excavators, will be retrofitted with oxidation catalysts to filter and break down hydrocarbons, particulate matter and carbon dioxide from diesel emissions. Refer to Section 6.9 and Chapter 8 of the Supplemental DEIS/FEIR for additional discussion of air quality mitigation measures during the construction period.

Dear Mr. Pugsley:

The Hispanic-American Chamber of Commerce, an organization of businesses, individuals, and institutions active in the Spanish and Portuguese speaking markets in the Northeast United States and abroad, supports the Logan Modernization Project and a greater emphasis on regional alternatives for upgrading our transportation infrastructure, including high speed rail and upgrading of the Worcester airport. 7.1

Our organization conducts outreach and information activities on behalf of nearly 10,000 small and disadvantaged businesses in New England which stand to benefit from the above initiatives as potential contractors to transportation agencies.

In addition, we are advocates for the Hispanic community which comprises much of the population around Logan Airport and which stands to benefit directly in terms of jobs and economical transportation from modernization of the airport.

Cordially,

Bruce Young Candelaria
Executive Director/
LOSP Director, Regions I & II

LETTER 8

Executive Office of Environmental Affairs
Attention: MEPA
Mr. Arthur Pugsley
EOEA 10458
100 Cambridge Street, 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

I have provided verbal testimony to you earlier in my capacity as Executive Director of the Massachusetts Aeronautics Commission, as did our Chairman, Sherman W. "Whip" Saltmarsh, Jr. I also a cosigned the letter from the six state aviation directors to MEPA supporting the airside improvements to Logan International Airport and opposing peak period pricing. On this, the final day of the comment period, I wanted to share two other comments with you.

First, in your review of the EIS/EIR, I respectfully recommend that you do so with an eye toward all of the previous planning and environmental analyses that precede this EIS/EIR including, but not limited to, the Second Major Airport Study, the Strategic Assessment Report, the New England Regional Air Service Study, Logan's GEIR. In many ways, this EIS/EIR represents the next logical process in that long chain of credible planning and environmental analyses. 8.1

Second, I would hope that Massachusetts Environmental Policy Act Unit and the Federal Aviation Administration will review the data before them in light of existing and applicable federal and state laws, regulations and policies. I have come to have a great respect for process. It would be a shame to divert attention to issues which are outside of the process at hand. For example, some would argue that certain procedures or methodologies were wrong or inaccurate and some even argue that MEPA and the FAA should adopt new procedures or methodologies. I submit that such discussion would be more appropriate in a process related to proposed rulemaking. I believe that Massport employed appropriate procedures and methodologies and the integrity of the process has been maintained. 8.2

Thank you for your time and consideration of these comments.

Sincerely,

Stephen R. Muench, Executive Director
Massachusetts Aeronautics Commission
Ten Park Plaza, Room 6620
Boston, MA 02116

Boston, MA 02202

RE: Boston/Winthrop
Logan Airside Improvements
DEIR/EOEA #10458

Attn: MEPA Unit

Dear Secretary Durand:

The Department of Environmental Protection Northeast Regional Office has reviewed the Draft Environmental Impact Statement/ Report (DEIS/R) submitted by the Massachusetts Port Authority (Massport) for the identification and review of operational and environmental implications of alternatives for reducing current and projected levels of aircraft delay at Boston-Logan International Airport (EOEA #10458).

Air Quality:

Summary

The air quality analysis presented in the DEIS/R includes both an emissions inventory and dispersion modeling. The emissions inventory analysis compares the emissions burden of the alternatives and concludes that Alternative 1 will generate the least amount of carbon monoxide (CO), volatile organic compounds (VOC), oxides of nitrogen (NOx) and particulate matter (PM_{10}). The dispersion modeling results conclude that the highest predicted levels of CO, nitrogen dioxide (NO_2) and PM_{10} are below state and federal standards.

The DEIS/R makes the statement that "Air quality will improve due to

improved airfield efficiency and shorter delay periods attributable to each of the capital improvements." The project is being proposed by Massport to reduce aircraft delays and the associated costs of such delays during certain wind and weather conditions. Massport argues that the project is not designed to provide additional capacity for increased operations at Logan Airport. While DEP agrees that the project, and runway 14/32 in particular, will not be the primary factor that will draw additional air traffic to Logan, air travel and passenger demand is projected to increase dramatically. The air pollution impacts of this additional air traffic are substantial and merit the implementation of all feasible mitigation measures including, but not limited to, the strategies described below. 9.1

Massport's past and future commitments to mitigation measures through the environmental review process should be binding and a funding plan should be prepared to ensure their implementation. DEP recommends that Massport prepare and include this plan in the Final EIS/R. 9.2

Logan Airport Air Pollution Emissions Trends

Over the past several years, DEP has commented on the GEIR for Logan Airport that emissions trends for Logan Airport after 1999 are a large concern. In summary, long-term emissions projections indicate that NOx and CO emissions will increase in 1999 and in 2010 for total airport emissions. VOC emissions decreased from 1990-1997 due to a change in aircraft fleet mix and controls on motor vehicles, but have increased since 1997. The increases in emissions are directly attributable to increases in aircraft operations due to increased passenger demand. The majority of emissions are generated by aircraft operations and ground service equipment as illustrated by the following tables:

Total Airport Emissions (kg/day)			
Year	1997	1999	2010
VOC	3183	3269	3207
NOx	5726	6670	8343
CO	14640	14470	16686

Aircraft Emissions (kg/day)			
Year	1997	1999	2010
VOC	1959	1883	1490
NOx	4592	5365	6666
CO	6636	6096	9144

Ground Service Equipment (kg/day)			
Year	1997	1999	2010
VOC	530	596	786
NOx	622	693	934
CO	6098	6953	9144

Airport and aircraft emissions represent the largest uncontrolled source of air pollution nationwide and in Massachusetts. In fact, aircraft emissions are the only mobile source of air pollution in the Massachusetts State Implementation Plan (SIP) emissions inventory that have not been controlled or slated for near- or long-term emissions reductions. 9.3

DEP is particularly concerned about the projected increase in NOx emissions. For comparison purposes, airport NOx emissions are equivalent

to emissions from major stationary sources including power plants. For the 1999 summer ozone season (153 days from May 1st through September 30), total emissions from Logan Airport rank as the sixth largest source of NOx emissions when compared to the 37 sources regulated under 310 CMR 7.27, the NOx Allowance Program. In 2010, after implementation of further NOx reductions pursuant to EPA's NOx SIP Call, Logan Airport will most likely rank as one of the highest sources of NOx when compared to these same sources.

Aircraft Emissions Reduction Measures and Strategies

DEP's past comments on the GEIR have recommended measures and strategies to reduce emissions from Logan Airport. The recommendations include both specific measures as well as policies that could be initiated to ensure that future emissions from Logan Airport do not exceed existing 1999 levels. For example, DEP has commented that emissions at Logan Airport should be capped at 1999 levels. The basis for this recommendation is that Massachusetts is a serious nonattainment area for ozone and is required under the Clean Air Act Amendments of 1990 to meet health-based clean air standards by 1999 and to maintain these standards thereafter. In addition, EPA adopted a more stringent 8-hour ozone standard in 1997 after a lengthy scientific review process. EPA determined that a more stringent standard was needed to protect public health. It is likely that additional emissions reductions beyond those already planned for will be needed for Massachusetts to meet the 8-hour standard for ozone.

DEP is encouraged by Massport's willingness to explore opportunities to mitigate expected emissions due to increased activity at Logan. In response to the Secretary's Certificate on the 1997 Annual Update, DEP met with Massport on March 30, 1999. As a result of this meeting Massport has agreed to assist DEP by providing data to assess the potential emissions reductions from implementing emissions-based landing fees. In addition, Massport indicated that they are conducting a survey and inventory of ground service equipment (GSE). DEP believes this inventory will provide important data to target and plan for the conversion of GSE to less-polluting alternatives. DEP recommends the following strategies and measures as air pollution mitigation for Logan Airport. 9.4

Airport Emissions Caps

McGuire Air Force Base in New Jersey has established an emissions budget under the federal General Conformity Rule, 40 CFR Parts 6, 51, and 53 as part of a proposal for base realignment.[1] This emissions budget creates a level of emissions for 1996 and 1999 that this airport may not exceed for these years or in the future without creating emissions offsets or requesting a SIP revision. The budget includes thirty source categories of emissions on the base. Another example of a cap approach is John Wayne Airport in Orange County California where the number of gate operations is limited to a certain number.

---

[1] An emissions budget is defined as the portion of a State Implementation Plan's projected emissions inventory that describe the levels of emissions (mobile, stationary, area, etc.) that provide for meeting reasonable further progress milestones, attainment, and/or maintenance for any criteria pollutant or its precursors.

As mentioned above, DEP suggests that emissions for Logan Airport be capped at 1999 levels and believes that McGuire Air Force Base and John Wayne Airport provide examples that this strategy is workable. 9.5

Economic Incentives for Cleaner Aircraft Engines

European airports have adopted policies where aircraft landing fees are established based on the emission characteristics of the aircraft. An example of a results-oriented emissions charge program is in Sweden where an aircraft emission charge for NOx and hydrocarbons (HC) was adopted in 1989. Two years later, HC emissions had declined by 62%, in part due to a decision by the domestic airline industry to modify the F28 fleet. Zurich Airport adopted an emissions charge in September of 1997 derived by decreasing landing fees by 5% and then redistributing the charge based on the emissions characteristics of the aircraft. The goal of the variable emissions charge is to provide an economic incentive for the airline industry to phase in cleaner engines and to deploy cleaner aircraft to areas with air quality problems. The Canton of Zurich established the aircraft emission charge program with the principle that all emission sources will have to contribute their share of emission reductions to meet air quality goals. Similar to U.S. airports, European airports are experiencing growth in travel demand and the relative contribution of airports to air pollution will continue to increase without further control strategies or programs.

To date, no airport in the United States has established an aircraft emissions charge, and this specific type of charge is not referenced in federal statute, case law or regulation. There is no direct legal precedent establishing the right of states and political subdivisions that own or operate airports to impose aircraft emission charges on commercial airlines. However, nothing in federal statute, case law or regulation prohibits the establishment of an aircraft emission charge. In fact, aircraft emission charges are a fairer approach to allocating the cost of mitigating air pollution generated by commercial aircraft than the weight-based landing fee system currently in place at most airports.

DEP's understanding is that airport operators assess aircraft landing fees to recover the costs of operating the airport; these fees may include the cost of environmental compliance. To the extent that Massport and the airlines are subject to an emissions cap and are responsible to mitigate air pollution from their activities, the adoption of an emissions-based landing fee system is warranted within the bounds of recovering the cost of environmental compliance and as a means to encourage cleaner aircraft engines. 9.6

Airside Operational Improvements

The DEIS/R proposes taxiway improvements including the Centerfield Taxiway, reconfiguring the Southwest Corner Taxiway System, extending Taxiway Delta and realigning Taxiway November. These improvements will reduce aircraft taxi time and associated emissions. DEP recommends that other measures be implemented at Logan to further reduce emissions from taxiing such as more widespread use of single engine taxiing. Terminal gate electrification is another measure with potential to reduce emissions significantly. DEP recognizes that these types of policies may be voluntary, but recommends that Massport provide further incentives or disincentives to increase participation by the airlines. These strategies not only reduce emissions, but also provide cost savings to the airline industry through fuel savings. Delta Airlines, for example, has reported savings of $5.9 million/year at Atlanta Airport alone. 9.7

Ground Service Equipment

Massport has made progress converting ground service equipment (GSE) and ground service vehicles to clean alternative fuels including compressed natural gas (CNG) and electric. DEP is encouraged by a program developed under the "Clean Air Partners" where tenants can purchase and be reimbursed for electric GSE equipment. However, despite this progress, the emissions inventory of emissions for all pollutants is projected to increase significantly in this category.

As mentioned above, Massport is in the process of inventorying GSE equipment at Logan. DEP believes this inventory is a critical first step for Massport to adopt a plan for vehicle and equipment conversions with specific emissions reduction targets. In addition to a plan for emissions reductions, Massport should actively promote these types of strategies and institute leasing agreements with the airlines and service providers to convert GSE. 9.8

Ground Access

Massport reported a decrease in HOV ridership levels from 1996-1997 in the 1997 GEIR Annual Update. This decrease was a result of another decline in the number of MBTA Blue Line transit riders accessing the airport; the number of transit riders has been declining since 1994. DEP is hopeful that the Blue Line Modernization project as well as the Airport Intermodal Transit Connector (AITC) will reverse this decline in transit ridership to the airport

Massport has adopted an airport passenger high occupancy vehicle (HOV) modeshare goal of 35.2% when annual airport passengers reach 37.5 million. DEP has commented previously that the targeted HOV modeshare goal of 35.2% should be higher, but Massport is reluctant to set a higher goal citing that HOV ridership increases may be harder to attain in the future. Nevertheless, DEP believes a higher modeshare is essential to accommodate the projected increase in air passengers without increasing air pollution from ground access vehicles. DEP recommends that MEPA require Massport to adopt a higher HOV modeshare goal and a specific action plan to reverse the trend of declining transit ridership. DEP believes these actions should precede the proposed Logan Airside Improvements Project. 9.9

One particular strategy that has been adopted by other airports is the consolidation of courtesy vehicles that serve rental car companies. Currently these courtesy vehicles circle Logan and pick up only their own customers. However, when there are no customers waiting, the vehicles create needless vehicle miles traveled (VMT), congestion and air pollution emissions. DEP recommends that Massport explore this strategy.

Construction Period Impacts

As MEPA is aware, last year the Central Artery Project, in cooperation with EPA-Region I, EOEA, Northeast States for Coordinated Air Use Management (NESCAUM) and DEP, with assistance from the Manufacturers of Emission Control Association (MECA), launched the Clean Air Construction Initiative. This program is the first in the nation to retrofit existing heavy construction equipment used at major public works/infrastructure projects with pollution control devices targeted at reducing diesel emissions and, consequently, reducing the localized adverse health impacts and nuisance conditions they may create. To date, ten (10) pieces of Central Artery construction equipment have been retrofitted and another sixty (60) pieces

are scheduled to be retrofitted by mid-1999.

In addition to implementation of diesel retrofit activities for the CA/T Project, DEP is actively discussing similar mitigation

actions for one or more projects being proposed by MBTA and MWRA and is planning to initiate discussions relative to a number of other large construction projects within the Boston Area.

DEP believes that the implementation of additional diesel emission controls on on-site heavy construction equipment can significantly mitigate localized, adverse air quality impacts. DEP recommends that MEPA include in its EIR scope the requirement that such actions be assessed by Massport for implementation as part of all construction activities related to construction at Logan Airport. 9.10

Parking Controls

Logan Airport and a portion of East Boston are subject to a parking freeze on airport-related parking. These parking freezes are included in the SIP as a measure to reduce ground-level ozone and carbon monoxide. Since the amendment of the Logan Freeze and adoption of the East Boston Freeze in 1989, Massport has made progress in relocating employee parking off of the airport and in encouraging less-polluting modes of access to the airport. However, DEP is aware of a proliferation of airport-related parking uses outside of the freeze boundaries most notably in Chelsea and in South Boston. DEP recommends that Massport complete a comprehensive inventory of all airport-related parking serving Logan and, if necessary, propose a management plan that is consistent with the goals of the parking freezes. 9.11

Study of Regional Transportation Alternatives

The DEIS/R reiterates Massport's estimate in the GEIR update that up to 7.3 million passengers can be diverted from Logan Airport to surrounding regional airports, rail and video teleconferencing. In comments on the 1994/1995 GEIR Update, DEP cited the need for an assessment and a comparison of the environmental impacts of regional aviation alternatives. The context of these comments is that DEP is in the position of reviewing many proposed airport projects without adequate information to assess their environmental impacts comparatively. DEP believes these comments are still relevant particularly in the context of the proposed project. As such, DEP recommends a more detailed study to look at the environmental impacts of the potential passenger diversion from Logan to allow for a comparison. Study components should include, at a minimum, impacts on air quality, vehicle miles traveled and wetlands. 9.12

Excavate and Building Demolition Materials:

Section 6.6 of the DEIS/R describes Massport's proposed procedures for management of the approximately 900,000 c.y. of excavate and building demolition materials (240,000 c.y. of this total relates to the need for removal and off-site management of a portion of the CA/T soils currently located on Governors Island that would interfere with the proposed runway 14/32).

- Page 6-99 describes the "approach" Massport is taking with regard to management of these materials which is, "...no excavation materials from Logan, no matter what the characterization results, will be disposed at sensitive areas, such as residential, recreational or wetland areas." DEP completely concurs with this approach and applauds Massport for taking such a protective position. 9.13

- Page 6-116 describes the anticipated project construction sequencing and indicates that the overwhelming majority of excavate production is anticipated to occur in the first two years of the project (2000 and 2001). Page 6-111 includes the following statements,

  "The majority of the excavated material has potential for being recycled as landfill daily cover and/or as landfill contouring closure material. Based on existing physical and chemical characteristics, the materials are compatible for recycle as daily cover and/or contouring closure materials and meet the MA DEP requirements for such applications.

  "Discussions with commercial landfill owners/operations have indicated that there is capacity at in-state and out-of-state landfills for the materials. Therefore, recycling as landfill daily cover and/or closure materials is considered to be the most viable soil management alternative."

DEP concurs with Massport's intention to beneficially reuse the excavate at landfills as either daily cover or pre-cap grading/shaping material ("contour closure material"). Based upon the status of unlined landfill closures and commercial landfill capacity (and therefore the "need" for mildly contaminated excavate), when Massport will require capacity for its excavate there may not be adequate demand for all the Logan material in the timeframe required by project sequencing. In this regard, DEP recommends that Massport assess backup options to minimize the potential for delays and/or cost increases. 9.14

- Relative to removal of the 240,000 c.y. of CA/T excavate currently located at Governors Island, staff from DEP has been working with representatives from Massport and Massachusetts Transportation Authority (MTA) to devise a confirmatory soil sampling program to allow for expedited and cost-effective off-site management of these soils.

- In various sections of the report (including 5-71, 5-75, 6-97, etc.) erroneous statements are made relative to the applicability of c.21E and the Massachusetts Contingency Plan (MCP) as it relates to the CA/T materials on Airport property. The following are relevant discussions and corrections for Massport to include into their Final document. 9.15

(1) Page 5-71 includes the following statement,

"All clearance material was removed by the MHD and disposed of off-site in 1996. In relation to the MCP, the corresponding terms for "clearance" and "non-clearance" are "remediation" and "non-remediation" waste, respectively."

The first sentence is correct, but the second with regard to defining Clearance and Non-Clearance is not. The terms Clearance and Non-Clearance relate strictly to determining whether or not the soils to be excavated for the CA/T Project exceed specific contaminant thresholds (a copy of the thresholds are appended to this comment letter) as it relates to off-site disposal options and worker protection. The definitions for these categories of CA/T soils is specified in the May 7, 1997, Amended MOU between MHD and DEP for management of CA/T excavate, and are indicated below.

"Clearance Criteria mean the concentration criteria for soils and groundwater requiring clearance analysis, as defined in the Clearance Procedures and as set forth in attached Exhibit B to this MOU."

"Non-Clearance Areas mean those portions of a Program Area outside of Clearance Areas identified by a Field Characterization Report, a Clearance Report, and/or a CA/T IRAC."

Much of the Non-Clearance soils are in-fact "remediation wastes" as defined under c.21E and the MCP.

(2) Page 5-75 includes the following statement,

"The Governors Island materials consist of silty sand with pockets of cohesive soils. In general, the stabilized harbor sediments contain lower contaminant levels than the excavated soils. The Response Action Outcome statement prepared by Massport concludes that a condition of No Significant Risk exists at Governors Island."

The characterization of harbor sediments as "less contaminated" than the excavated soils is incorrect. Most of the 90,000 c.y. of sediments placed into a double-lined landfill on Governors Island are significantly more contaminated than the CA/T soils placed at adjacent areas of Governors Island. The placement of the CA/T dredged sediments and excavated soils was specifically approved by DEP under the authority of c.21E/MCP in November 22, 1994 correspondence based on submission by MHD and approval by DEP of a Human Health and Ecological Risk Assessment.

(3) Page 6-97 includes the following statement,

"As described in Section 5.6, materials stored at Governors Island as part of the Central Artery/Tunnel Project (CA/T Project) were initially classified by the Massachusetts Highway Department (MHD) using criteria defined in a Memorandum of Understanding (MOU) between the MA DEP and MHD. While these criteria were initially used to characterize the materials, the MOU criteria have since been superseded by standards established in the Massachusetts Contingency Plan (MCP) (310 CMR 40.0000)."

The discussion relative to the MOU excavate criteria being superseded by the MCP is incorrect. The MOU's authority is derived directly from c.21E, see excerpts below taken from the MOU.

"In accordance with the provisions of c.21E §3(c), authorizing DEP to integrate the implementation and enforcement of c.21E with other programs established for the protection of public health, safety, welfare, and the environment, MHD and DEP enter into and agree that this MOU sets forth the procedures to be followed by DEP and MHD to comply with c.21E and the MCP with respect to all response actions undertaken and conducted in connection with the design and construction of the Central Artery/Tunnel Project.

"It is the intent and understanding of DEP and MHD that all words and phrases used in this MOU which are defined in the Massachusetts Oil and Hazardous Material Release Prevention and Response Act, (hereinafter "M.G.L. c.21E" or "c. 21E") and/or in the Massachusetts Contingency Plan, 310 CMR 40.0000 et. seq.,

(hereinafter "MCP" or "the MCP"), shall have that definition ascribed to them unless otherwise expressly defined herein."

DEP has previously made a formal determination that the permanent placement of the CA/T dredged sediments and excavate at Governors Island does not result in a condition of Significant Risk as defined in the MCP.

The DEP Northeast Regional Office appreciates the opportunity to comment on this proposed project. Specific questions regarding the air quality issues should be addressed to Christine Kirby at (617) 292-5631. Specific questions regarding solid waste/contaminated soils issues should be addressed to Steve Lipman at (617) 292-5698. General questions regarding these comments should be directed to David Shakespeare at (978) 661-7797.

Sincerely,

John Felix,
Deputy Regional Director,
MEPA Review Coordinator

Code	Topic 1	Topic 2	Comment	Response
9.1	Mitigation	Initiatives	While DEP agrees that the project, and runway 14/32 in particular, will not be the primary factor that will draw additional air traffic to Logan, air travel and passenger demand is projected to increase dramatically. The air pollution impacts of this additional air traffic are substantial and merit the implementation of all feasible mitigation measures....	Refer to the *Logan Airport 1999 ESPR* (previously GEIR) for the status of Massport's mitigation programs and to Chapter 8 of the Supplemental DEIS/FEIR for a discussion of proposed Airside Project mitigation measures.
9.2	Mitigation	Initiatives	Massport's past and future commitments to mitigation measures through the environmental review process should be binding and a funding plan should be prepared to ensure their implementation. DEP recommends that Massport prepare and include this plan in the Final EIS/R.	Massport's mitigation measures are reinforced through compliance with M.G.L. Chapter 30A, Section 61 and through specific state and federal certificates approving projects that have mitigation. The status of the Section 61 Finding commitments are tracked and reported in the *Logan Airport 1999 ESPR* (previously GEIR). See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR. Massport follows a five-year capital budget planning process to provide context for financing specific projects. As these projects, which include established mitigation measures, proceed to the implementation stage, appropriate financing plans are finalized, which can include proceeds from bond issues, available internal funds, and grant funds. These plans are developed through the Massport Board approval process.
9.3	Air Quality	Impacts	...long-term emissions projections indicate that NOx and CO emissions will increase in 1999 and in 2010 for total airport emissions. VOC emissions decreased from 1990-1997 due to a change in aircraft fleet mix and controls on motor vehicles, but have increased since 1997. The increases in emissions are directly attributable to increases in aircraft operations due to increased passenger demand. Airport and aircraft emissions represent the largest uncontrolled source of air pollution nationwide and in Massachusetts. DEP is particularly concerned about the projected increase in NOx emissions. In 2010, after implementation of further NOx reductions pursuant to EPA's NOx SIP Call, Logan Airport will most likely rank as one of the highest sources of NOx when compared to these same sources.	The EOEA May 7, 1999 Certificate on the Airside Project Draft EIS/EIR requested that Massport undertake a feasibility study of implementing measures to reduce NOx emissions at Logan Airport. This study is currently underway and will be presented to MEPA by the end of March 2001. Appendix A (*Ozone Modeling Support Document for the New England Domain*) of DEP's Attainment Submittal of April 1998, indicated that on-road mobile sources are a greater concern for NO_x and area sources a greater concern for VOCs than Logan Airport.
9.4	Air Quality	Mitigation	DEP is encouraged by Massport's willingness to explore opportunities to mitigate expected emissions due to increased activity at Logan.	Massport is actively involved in many air quality initiatives and explored other options to reduce emissions from activities at Logan Airport in the *Logan Airport 1999 ESPR* (previously GEIR).
9.5	Air Quality	Mitigation	...DEP suggests that emissions for Logan Airport be capped at 1999 levels and believes that McGuire Air Force Base and John Wayne Airport provide examples that this strategy is workable.	Refer to response to Comment 9.3.

Code	Topic 1	Topic 2	Comment	Response
9.6	Air Quality	Emission-Based Landing Fees	To the extent that Massport and the airlines are subject to an emissions cap and are responsible to mitigate air pollution from their activities, the adoption of an emissions-based landing fee system is warranted within the bounds of recovering the cost of environmental compliance and as a means to encourage cleaner aircraft engines.	Refer to response to Comment 9.3.
9.7	Air Quality	Taxiway Improvements	These improvements will reduce aircraft taxi time and associated emissions. DEP recommends that other measures be implemented at Logan to further reduce emissions from taxiing such as more widespread use of single engine taxiing.	Refer to response to Comment 9.4.
9.8	Air Quality	Alternative Fuels	Massport has made progress converting ground service equipment (GSE) and ground service vehicles to clean alternative fuels...Massport is in the process of inventorying GSE equipment at Logan. DEP believes this inventory is a critical first step for Massport to adopt a plan for vehicle and equipment conversions with specific emissions reduction targets...Massport should actively promote these types of strategies and institute leasing agreements with the airlines and service providers to convert GSE.	Massport has taken enterprising steps to encourage tenant use of alternative fuels [electric and compressed natural gas]. Massport will use the results of the ground service equipment survey to assess the feasibility of establishing alternative fuel targets for tenant vehicles and ground service equipment.
9.9	Ground Transportation	HOV	DEP recommends that MEPA require Massport to adopt a higher HOV modeshare goal and a specific action plan to reverse the trend of declining transit ridership. One particular strategy that has been adopted by other airports is the consolidation of courtesy vehicles that serve rental car companies. DEP recommends that Massport explore this strategy.	The *Logan Airport 1999 ESPR* (previously GEIR) reports on Massport's progress on meeting its air passenger goal of 35.2 percent by the time air passenger volumes reach 37.5 million annual passengers. Consideration will be given to ways to enhance transit ridership and use of the Logan Express bus service. In addition, Massport is considering consolidation of car rental facilities, which will facilitate the consolidation of the courtesy vehicles serving the rental car companies.
9.10	Construction	Air Quality	DEP believes that the implementation of additional diesel emission controls on on-site heavy construction equipment can significantly mitigate localized, adverse air quality impacts. DEP recommends that MEPA include in its EIR scope the requirement that such actions be assessed by Massport for implementation as part of all construction activities related to construction at Logan Airport.	Massport will require contractors to retrofit their heavy construction equipment with advanced pollution control devices in accordance with DEP's Clean Air Construction Initiative. Contractor owned equipment, such as front-end loaders, backhoes, cranes and excavators, will be retrofitted with oxidation catalysts to filter and break down hydrocarbons, particulate matter and carbon dioxide from diesel emissions. Refer to Section 6.9 and Chapter 8 of the Supplemental DEIS/FEIR for additional discussion of air quality mitigation measures during the construction period.
9.11	Air Quality	Parking Freeze	DEP recommends that Massport complete a comprehensive inventory of all airport-related parking serving Logan and, if necessary, propose a management plan that is consistent with the goals of the parking freezes.	The *Logan Airport 1999 ESPR* (previously GEIR) provides an inventory of parking at Logan Airport, clearly identifying Massport's adherence to the parking freeze. This information is provided to DEP on a quarterly basis and is reported in the ESPR or subsequent Annual Updates. These documents also discuss parking demand and management at Logan Airport.
9.12	Regional Transportation	Diversion	The DEIS/R reiterates Massport's estimate in the GEIR update that up to 7.3 million passengers can be diverted from Logan Airport to surrounding regional airports, rail and video teleconferencing...DEP recommends a more detailed study to look at the environmental impacts of the potential passenger diversion from Logan to allow for a comparison. Study components should include, at a minimum, impacts on air quality, vehicle miles traveled and wetlands.	In accordance with the MEPA Certificate on the Airside Project Draft EIS/EIR, the Supplemental DEIS/FEIR contains a summary of the environmental impacts of growth at the regional airports, based on existing available environmental documents and studies. Refer to Appendix B of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
9.13	Soil/Sediment	Reuse/ Disposal Option	Page 6-99 describes the "approach" Massport is taking with regard to management of these materials which is, "...no excavation materials from Logan, no matter what the characterization results, will be disposed at sensitive areas, such as residential, recreational or wetland areas." DEP completely concurs with this approach and applauds Massport for taking such a protective position.	Comment noted.
9.14	Soil/Sediment	Reuse/ Disposal Option	DEP concurs with Massport's intention to beneficially reuse the excavate at landfills as either daily cover or pre-cap grading/shaping material...when Massport will require capacity for its excavate there may not be adequate demand for all the Logan material in the timeframe required by project sequencing. In this regard, DEP recommends that Massport assess backup options to minimize the potential for delays and/or cost increases.	Massport recognizes that there may not be sufficient in-state landfill capacity. Alternative sites will be examined during design. The volume of soil excavated has been reduced as a result of the on-going removal of stockpiled CA/T soil material from Governors Island, and the findings of a subsurface investigation program that much of the existing soil material on the airport is suitable for construction and therefore does not have to be removed. Massport recently completed a soil boring and chemical analytical program along the centerlines of Runway 14/32 and the Centerfield Taxiway. The preliminary soil chemical data indicate that the large majority of soil to be excavated is not regulated soil in that it did not exceed the S-2 Reportable Concentration. Therefore, this excavate may be recycled at in-state or out-of-state lined landfills or used at industrial sites for fill. In accordance with Massport's Soil Management Plan, the excavate will not be used for fill or any other use at environmentally sensitive sites such as near wetlands, playgrounds, water supplies, etc.
9.15	Soil/Sediment	Reuse/ Disposal Option	In various sections of the report (including 5-71, 5-75, 6-97, etc.) erroneous statements are made relative to the applicability of c.21E and the Massachusetts Contingency Plan (MCP) as it relates to the CA/T materials on Airport property.	The sections referenced in the comment have been clarified. The soil classifications used in the Airside Project Draft EIS/EIR were a combination of terms from the original MOU between the DEP and MassHighway for the temporary storage of soil at Governors Island and the current Massachusetts Contingency Plan (MCP). The older MOU terminology was included for background. To avoid further confusion, the Supplemental DEIS/FEIR addresses these soils using only the MCP terminology.

LETTER 10

21 April 1999

NHESP File: 96-384

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, Massachusetts 02202

Project Name:	Logan Airside Improvements
Proponent:	Massport, Federal Aviation Administration
Location:	Boston
Document Reviewed:	DEIR/EIS
EOEA File Number:	10458

Attention: MEPA Unit/Arthur Pugsley

Dear Secretary Durand,

The Natural Heritage and Endangered Species Program ('NHESP') has reviewed the Draft Environmental Impact Report for the Logan Airside Improvements project and would like to offer the following comments regarding impacts to state-protected rare species.

The proposed Logan Airside Improvements project will impact nesting and feeding habitat of the state 'endangered' Upland Sandpiper (*Bartramia longicauda*) and will result in the 'taking' of a state-protected rare species pursuant to the Massachusetts Endangered Species Act (M.G.L. c. 131A) and its implementing regulations (321 CMR 10.00). NHESP has been meeting with Massport and their consultants to work out the details of a Conservation Permit that would allow a 'taking' in return for both on-site and off-site mitigation. The on-site mitigation has been detailed in the DEIR/EIS. The proposed off-site mitigation will entail restoring approximately 150 acres of Upland Sandpiper habitat at the Massachusetts Military Reservation. The details of the proposed restoration work have not been completed but Massport should finalize these details with NHESP before the final EIR is submitted to MEPA. 10.1

Code	Topic 1	Topic 2	Comment	Response
10.1	Ecosystems	Rare Species	The proposed Logan Airside Improvements project will impact nesting and feeding habitat of the state 'endangered' Upland Sandpiper (*Bartramia longicauda*) and will result in the 'taking' of a state protected rare species pursuant to the Massachusetts Endangered Species Act (M.G.L. c. 131A) and its implementing regulations (321 CMR 10.00). NHESP has been meeting with Massport and their consultants to work out the details of a Conservation Permit that would allow a 'taking' in return for both on-site and off-site mitigation. The details of the proposed restoration work have not been completed but Massport should finalize these details with NHESP before the final EIR is submitted to MEPA.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.

OFFICE OF THE PRESIDENT
MASSACHUSETTS SENATE
STATE HOUSE, BOSTON 02133-1007

THOMAS F. BIRMINGHAM
PRESIDENT

LETTER 11

April 22, 1999

Secretary Robert Durand
Executive Office of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
Cambridge Street 20th Floor
Boston, MA 02202

Dear Secretary Durand:

Since the inception of the debate over the proposed new runway at Logan International Airport, I have sought to assess the issue on the merits and with an emphasis on fact-based, verifiable analysis. Although a purely parochial view would have dictated my fierce and immediate opposition to the proposal, that was not my approach. I chose to put research above demagoguery because ultimately that is in all of our best interests.

This proposal has statewide and regional implications. It needs to be reviewed in that broad context with regard to our environment, our economy and the quality of life experienced by the residents of Massachusetts. I have listened to proponents and opponents and have heard the variety of arguments, analyses and projections.

With the comment period in the MEPA process drawing to an end, I feel compelled to share my serious reservations about the proposed new runway. The 17 questions I have included below suggest that significant issues about the efficacy and desirability of the proposed runway remain unanswered.

I am requesting that Massport withdraw its application before the Secretary and that a "Blue Ribbon Commission" be formed to examine the issues posed not only with regard to Logan, but also concerning the adequacy of this entire region's air transportation system. 11.1

This Commission must be comprised of individuals who represent the variety of interests involved. A Commission can work—and inspire the respect and confidence of interested parties—only if the review is reasoned, thorough and balanced. I am not inclined to disparage any individuals currently working at or for Massport but as an institution it suffers from a serious lack of credibility. There is too much prologue of malleable commitments and revisionist history for a decision of this import to rely solely

on Massport's assessments and recommendations. A number of the questions I have raised concern the appearance of selectivity and bias in the information Massport has proffered to further its goal.

It is my hope that Massport will voluntarily agree to this approach. It is in its best interest for any developments to grow out of a substantiated, defensible and comprehensive review. If Massport, however, is not willing to turn to an unbiased, top-level commission at this stage, then I am prepared to consider legislation to impose a moratorium. My hope is that we can move forward with a commitment to cooperation and information. If that is not possible, I will oppose runway construction until a "Blue Ribbon Commission" has sufficient time to conduct a study and make its report.

There ought not to be a rush to judgment when the infrastructure, air quality and livability of the Commonwealth is at stake. We need time and advice to move forward with greater knowledge and confidence than anyone can possess at this point.

1. Massport has indicated that alleviating delays is the primary reason for the runway. If delays are such a problem, then why isn't there detailed analysis of the historical delay data in the Draft Environmental Impact Study/ Report (EIS/R)? 11.2

2. Delays declined between 1993 and 1997 (with the exception of 1996). Massport has provided insufficient analysis of this trend. Can anything be learned from this experience? 11.3

3. Delay management is at the crux of Massport's argument for the runway. Yet the EIS/R delay management review fails to explore the issue fully. Instead the runway is posited as the best solution. Why does Massport conclude that a runway is the foremost option at this point, when other alleviating measures are not fully explored? 11.4

4. Massport contends that the proposed new runway will reduce delays. Yet there is an acknowledgement that in the future delays will increase above current levels. There is some indication delays will return to current levels within 5 years. If this is accurate, how can the runway be portrayed as a long-term solution to alleviate delays? Why isn't there a comprehensive plan to meaningfully alleviate delays long-term? 11.5

5. Massport numbers seem to show that in 2010 peak pricing alone is more effective to reduce delay. Is that accurate? If so, why isn't Massport proposing that approach now? 11.6

6. Massport raises concerns about the economic impact of peak pricing on specialized markets such as Cape Cod. Why can't special exemptions be put in place for these types of specialized markets? Alternatively, why can't at least some of the air traffic related to these specialized markets use other airports, such as Hanscom or Worcester? 11.7 11.8

7. Would the new runway and midfield taxiway provide long-term reduction of airport congestion or will the same problems reoccur if flight volume is increased? What prevents flight volume from increasing? 11.9

8. Has Massport utilized all of the non-Logan options to reduce airport congestion, including increased use of regional airports, Hanscom Field, congestion pricing and other alternatives? 11.10

9. Massport data seem to suggest there could be a tripling of airplane travel over East Boston, Chelsea, South End, and parts of South Boston, Roxbury and Jamaica Plain. Is this accurate? What is the justification for further impacting these neighborhoods? 11.11

10. Massport suggests there will be a reduction in noise in parts of East Boston, Revere, South Boston, Dorchester and Milton. How can this be reconciled with Massport's proposal to construct a center field taxiway for 4-22 runways? 11.12

11. What mitigation measures would be provided to the impacted communities (beyond soundproofing of homes)? 11.13

12. Massport makes the promise to use the new runway in only one direction. How can Massport assure residents, who have experienced Massport's efforts to amend environmental documents by breaking promises they made, that this is different? Are there enforceable guarantees for no overland flights using the new runway, and what controls will be in place to prevent the Federal Aviation Administration from overriding local agreements? What is to prevent Massport from working to amend conditions set forth in the EIR? 11.14

13. Reducing the number of small aircraft using Logan airport would reduce delays. Is it accurate that aircraft carrying fewer than 50 passengers use 45% of Logan take-off and landing capacity? Where does Logan rank nationally in terms of the number of flights going in and out the airport? And where does Logan rank nationally in terms of the number of small flights going in and out of the airport? Doesn't the construction of a short 14-32 runway worsen delay by encouraging continued investment in small aircraft? 11.15

14. Don't inefficient and outmoded terminals contribute to delays at Logan? How much of the problem is due to aircraft waiting to get access to gates and physical constraints on the number of ticket agents and baggage handling? What is Massport's plan for addressing one of its more problematic terminals, Terminal A? 11.16

15. What are Massport's plans to handle the increased need for public transportation to the airport, once capacity is increased? 11.17

16. Massport is now touting plans to increase usage of Worcester Airport. Why did Massport wait until public pressure arose for regional airports to file the bill that gives them control of this airport? Are there other options that could be pursued but due to lack of interest remain unexplored? 11.18

17. There are concerns about the levels of increased toxic emissions from aircraft. What sort of assurance can be provided that the state's implementation plan to comply with the Federal Clean Air Act will not be jeopardized by increased air traffic? Even if the state is in technical compliance, there ought to be an estimate as to what level of increase could result from the growth in air traffic at Logan before the runway proceeds. 11.19

I respectfully request you to consider this overwhelming number of unanswered questions in deciding the suffioiency of Massport's environmental impact report for this project.

Ultimately, I believe it would be fundamentally irresponsible for a project of this magnitude to move forward while major issues remain unresolved. For this reason, I hope Massport will withdraw its application until a truly independent commission can comprehensively review the issue. Also, I intend to support a legislative moratorium if Massport proceeds with this project nonetheless.

Thank you for considering these comments.

Very truly yours,

Thomas F. Birmingham

Letter 11
MA State Senator Thomas F. Birmingham

Code	Topic 1	Topic 2	Comment	Response
11.1	Environmental Review Process	Blue Ribbon Panel	I am requesting that Massport withdraw its application before the Secretary and that a "Blue Ribbon Commission" be formed to examine the issues posed not only with regard to Logan, but also concerning the adequacy of this entire region's air transportation system.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March 2000 and then met at least monthly with a final meeting in December 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS; the Airside Project Draft EIS/EIR; responses to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR; and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies have concluded that The Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high-speed rail are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of regional transportation alternatives to Logan Airport and steps Massport has taken to foster increased use of these alternatives. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999, attendance at a second summit in December 2000, and its assumption of operating responsibility for the Worcester Regional Airport in January 2000. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a discussion of Massport's initiatives in support regional transportation alternatives.
11.2	Purpose and Need	Delay	Massport has indicated that alleviating delays is the primary reason for the runway. If delays are such a problem, then why isn't there detailed analysis of the historical delay data in the Draft Environmental Impact Study/ Report (EIS/R)?	Chapters 1 and 4 of the Supplemental DEIS/FEIR provide analysis of delays at Logan Airport. Delays primarily occur when wind or weather conditions require the use of configurations with fewer than three active runways or when poor weather requires increased separation distances between aircraft. Proposed Runway 14/32 would be designed to reduce delays at Logan Airport from adverse winds Section 1.6 of the Supplemental DEIS/FEIR contains a description of the delay factors at Logan Airport, and a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.

Code	Topic 1	Topic 2	Comment	Response
11.3	Purpose and Need	Delay	Delays declined between 1993 and 1997 (with the exception of 1996). Massport has provided insufficient analysis of this trend. Can anything be learned from this experience?	Logan Airport flight delays, as measured by the FAA, did decline between 1993 and 1997. Nevertheless, the same data show that Logan Airport was consistently ranked as one of the nation's most delayed airports throughout this period. In 1998, delayed flights at Logan Airport, as reported by the FAA increased by more than 30 percent and continued to increase in 2000. In 2000, Logan Airport was second most delayed in the United States for arrivals. This represents the worst rank in Logan Airport's history. Refer to Chapter 1 of the Supplemental DEIS/FEIR for a discussion of Logan Airport delays caused elsewhere in the system. There are three reasons for the decline in delays between 1993 and 1997. First, in 1997, the number of hourly scheduled flights was less than Logan Airport's normal operating capacity of 120 flights per hour, unlike 1993, when airlines scheduled flights well beyond Logan Airport's hourly capacity. Second, Logan Airport's hourly demand profile is flatter than it was in 1993. Airlines are spreading scheduled flights throughout the day taking advantage of Logan Airport's off-peak hours (*e.g.*, 10 AM to 1 PM). Finally, airlines are carrying more passengers per flight. In fact, with roughly the same number of flights as in 1993, Logan Airport accommodated over 3 million more passengers. One reason for this is that the regional carrier network serving New England is more efficient. In 1993, there were three regional carrier systems serving 2.1 million regional passengers at Logan Airport. Since 1994, Logan Airport has been served by two regional airline systems (Business Express, now American Eagle, and US Airways Express). These carriers handled 2.2 million Logan Airport passengers in 1998. Key lessons learned from this are: 1) while PPP might work in conditions of overscheduling, such as the 1993 environment, because there is no sustained period of flight overscheduling at Logan Airport today, PPP would not provide meaningful delay reduction in the current operating environment; and 2) while delays declined from 1993 to 1997, Logan Airport continued to be one of the most delayed airports in the country because, even though carriers were more efficient at scheduling flights, delays caused by wind and weather continued to occur.

Code	Topic 1	Topic 2	Comment	Response
11.4	Purpose and Need	Delay	Delay management is at the crux of Massport's argument for the runway. Yet the EIS/R delay management review fails to explore the issue fully. Instead the runway is posited as the best solution. Why does Massport conclude that a runway is the foremost option at this point, when other alleviating measures are not fully explored?	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility Study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside Project analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
11.5	Delay	Solution	Massport contends that the proposed new runway will reduce delays. Yet there is an acknowledgement that in the future delays will increase above current levels. There is some indication delays will return to current levels within 5 years. If this is accurate, how can the runway be portrayed as a long-term solution to alleviate delays? Why isn't there a comprehensive plan to meaningfully alleviate delays long-term?	If no actions are taken to alleviate the delay problem, future delays will increase substantially. For example, under the 37.5M Low Fleet scenario, runway-related delays will nearly double (95 percent), or by 114,000 annual hours, over 1998 delay levels. By implementing the Preferred Alternative, delays will increase in the future as aircraft operations increase, because delays from inclement weather (IFR conditions), such as snowstorms or fog, cannot be avoided. The Preferred Alternative, however, significantly reduces delays that occur during clear weather conditions (VFR conditions). If no actions are taken, VFR delays will increase by 75 percent, or 38,000 hours, over 1998 levels. With the Preferred Alternative, VFR delays actually *decline* by 18 percent, or 9,000 hours. This represents a reduction in VFR delays of more than 50 percent compared to the No Action Alternative for the 37.5 M Low Fleet scenario.
11.6	Alternatives	Peak Period Pricing	Massport numbers seem to show that in 2010 peak pricing alone is more effective to reduce delay. Is that accurate? If so, why isn't Massport proposing that approach now?	The Airside analysis indicates that PPP is an effective option when airline's schedule beyond the normal hourly operating capacity of the airport. PPP is not recommended for implementation at this time because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
11.7	Alternatives	Peak Period Pricing	Massport raises concerns about the economic impact of peak pricing on specialized markets such as Cape Cod. Why can't special exemptions be put in place for these types of specialized markets?	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

Code	Topic 1	Topic 2	Comment	Response
11.8	Regional Transportation	Regional Airports	...why can't at least some of the air traffic related to these specialized markets use other airports, such as Hanscom or Worcester?	Regional carriers that provide service between the Cape Cod and Island markets and Logan Airport are not likely to shift these services to other regional airports because doing so would reduce the number of passengers and the economic viability of such services. Regional carriers serving Logan Airport carry a mix of local and connecting passengers. As the largest city in New England, the Boston metropolitan area represents the largest concentration of demand for outlying regional carrier markets. Also, up to 50 percent of the passengers on regional carrier flights connect to other flights at Logan Airport. Shifting regional carrier flights to other airports, such as Manchester Airport or T.F. Green/Providence Airport would likely reduce the amount of on-board passenger traffic since a significant number of passengers are either traveling to Boston or connecting to flights that are not available from the outlying airports. For example, service to Manchester would not be a viable alternative for a Provincetown passenger traveling to a location in downtown Boston. Likewise, service to Providence would not be attractive to a Provincetown passenger trying to reach Denver, since there are no nonstop Denver services at T.F. Green/Providence Airport..
11.9	Alternatives	Runway 14/32, Taxiway Improvements	Would the new runway and midfield taxiway provide long-term reduction of airport congestion or will the same problems reoccur if flight volume is increased? What prevents flight volume from increasing?	Proposed Runway 14/32 and all other proposed projects would reduce current and future delays and enhance safety. The sooner that these improvements are implemented, the more long-term delay benefits will be realized. Major factors in airline competition are frequency of service and number of markets served. PPP was included in the airside improvement alternatives to address delays caused by airline over-scheduling. Airline over-scheduling is only a problem when flight demand during the peak hours exceeds the airfield's average VFR capacity. Because of competitive factors, airlines have reduced peak period flights since 1993. As a result, airline over-scheduling is not currently a problem at Logan Airport and Massport is not recommending the implementation of PPP at this time. Flight volume at Logan Airport is a function of the demand for air travel. Growth in air travel demand is principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports.
11.10	Alternatives	Other Non-Constructi on Alternatives	Has Massport utilized all of the non-Logan options to reduce airport congestion, including increased use of regional airports, Hanscom Field, congestion pricing and other alternatives?	Refer to response to Comment 11.8 and to Chapter 2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
11.11	Noise	Runway Use	Massport data seem to suggest there could be a tripling of airplane travel over East Boston, Chelsea, South End, and parts of South Boston, Roxbury and Jamaica Plain. Is this accurate? What is the justification for further impacting these neighborhoods?	Also refer to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of runway use and to Sections 6.2 of the Supplemental DEIS/FEIR for a discussion of noise impacts. In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. Similarly, overflights affecting Winthrop (Runway 27 arrivals and Runway 9 departures) will decline from 88,224 in 1998 to 55,805. As a result of the relief for these communities, flights over the water and flights over less impacted communities will increase. With Runway 14/32, the over-water procedure (Runway 14 and Runway 15 departures, Runway 32 and Runway 33 arrivals) becomes the most used set of runways with operations increasing from 34,222 in 1998 to 82,965. Overflights affecting the South End, parts of South Boston, and Roxbury (Runway 27 departures) will increase from 20,356 to 41,974, making this the fourth most used procedure, up from fifth in 1998. Overflights affecting Chelsea, the Eagle Hill section of East Boston, Everett, and Somerville (Runway 33 departures and Runway 15 arrivals) will increase from 9,804 to 35,801. This will become the fifth most used procedure, up from the sixth, or least used procedure in 1998.
11.12	Noise	Taxiway Improvements	Massport suggests there will be a reduction in noise in parts of East Boston, Revere, South Boston, Dorchester and Milton. How can this be reconciled with Massport's proposal to construct a center field taxiway for 4-22 runways?	The purpose of the proposed Centerfield Taxiway system is to improve the flow of taxiing aircraft and to reduce aircraft ground delay. With the Centerfield Taxiway in place, neighbors in Winthrop and East Boston adjacent to the taxiways will experience small reductions in ground noise. These are different from the noise level reductions that occur in parts of East Boston, Revere, South Boston, and Dorchester with the Preferred Alternative. Improvements in those communities are derived from the added flexibility afforded by Runway 14/32. It allows the redistribution of traffic so that there are fewer landings on Runway 4L and 4R and fewer takeoffs on Runways 22L and 22R. The taxiway itself has no bearing on these flights.
11.13	Noise	Mitigation	What mitigation measures would be provided to the impacted communities (beyond soundproofing of homes)?	Chapter 8 of the Supplemental DEIS/FEIR summarizes Massport's proposed project-specific mitigation program associated with the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
11.14	Alternatives	Runway 14/32	Massport makes the promise to use the new runway in only one direction. How can Massport assure residents, who have experienced Massport's efforts to amend environmental documents by breaking promises they made, that this is different? Are there enforceable guarantees for no overland flights using the new runway, and what controls will be in place to prevent the Federal Aviation Administration from overriding local agreements? What is to prevent Massport from working to amend conditions set forth in the EIR?	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 (heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations, which would thereby limit operational impacts over residential areas. To reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. It is anticipated that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
11.15	Alternatives	Other Non-Constructi on Alternatives	Reducing the number of small aircraft using Logan Airport would reduce delays. Is it accurate that aircraft carrying fewer than 50 passengers use 45% of Logan take-off and landing capacity? Where does Logan rank nationally in terms of the number of flights going in and out the airport? And where does Logan rank nationally in terms of the number of small flights going in and out of the airport? Doesn't the construction of a short 14-32 runway worsen delay by encouraging continued investment in small aircraft?	Refer to Section 8.5 of the Supplemental DEIS/FEIR for a discussion of ways the unidirectional restriction can be enforced. Small aircraft can be accommodated on any runway configuration at Logan Airport. Proposed Runway 14/32 would allow Logan Airport to maintain its full Visual Flight Rule capacity in northwest wind conditions and would not provide a new capability to accommodate small aircraft, nor would it encourage additional investment in this type of equipment. Based on an analysis of airline schedules for May 1999, 41.7 percent of Logan Airport's scheduled arrivals and departures were on regional aircraft with fewer than 50 seats. For calendar year 1998, Logan Airport ranked eighth among United States airports in terms of total aircraft operations. Based on May 1999 airline schedules, Logan Airport ranked fifth among United States airports in terms of scheduled arrivals and departures on aircraft with fewer than 50 seats and ranked seventh in terms of total scheduled aircraft operations. Massport has proposed to implement a Peak Period Monitoring System to determine, based on future growth in scheduled aircraft operations, if airline overscheduling is becoming a problem at Logan Airport. Should airline-overscheduling conditions arise, Massport will initiate Phase 1 of a phased PPP implementation process. In Phase 1 of the process, Massport will meet with individually airlines to seek voluntary schedule adjustments to avoid delays that result from overscheduling.

Code	Topic 1	Topic 2	Comment	Response
11.16	Delay	Apron Alternatives	Don't inefficient and outmoded terminals contribute to delays at Logan? How much of the problem is due to aircraft waiting to get access to gates and physical constraints on the number of ticket agents and baggage handling? What is Massport's plan for addressing one of its more problematic terminals, Terminal A?	The Airside analysis evaluates delays related to inefficiencies of the airfield and does not include delays related to aircraft waiting to access gates or outmoded terminals and terminal facilities. Massport and individual airlines are currently undertaking redevelopment of the landside portion of the airport *(i.e.*, terminals, roadways, etc.). These projects are also required to undergo environmental review. For Terminal A, Delta Air Lines received environmental approval for its proposed terminal replacement project in late 1999. *Logan Airport's 1999 ESPR* (formerly GEIR) reports on cumulative impacts of Logan Airport's landside and airside operations.
11.17	Ground Transportation	Access to Logan	What are Massport's plans to handle the increased need for public transportation to the airport, once capacity is increased?	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).
11.18	Regional Transportation	Regional Airports	Massport is now touting plans to increase usage of Worcester Airport. Why did Massport wait until public pressure arose for regional airports to file the bill that gives them control of this airport? Are there other options that could be pursued but due to lack of interest remain unexplored?	Massport has a long-standing relationship with the City of Worcester to aid Worcester Regional Airport in reaching its full potential, thereby improving the efficiency of the New England air transportation network. Massport assumed operational control of the Worcester Regional Airport on January 15, 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of Massport's efforts to promote increased utilization of Worcester Regional and the other regional airports.
11.19	Air Quality	NAAQS	There are concerns about the levels of increased toxic emissions from aircraft. What sort of assurance can be provided that the state's implementation plan to comply with the Federal Clean Air Act will not be jeopardized by increased air traffic? Even if the state is in technical compliance, there ought to be an estimate as to what level of increase could result from the growth in air traffic at Logan before the runway proceeds.	The emissions inventories for future conditions and alternatives are contained in Section 6.4 of the Supplemental DEIS/FEIR and Appendix F. These inventories show that all Alternatives, including the No Action and Preferred Alternative, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM_{10}) under any alternative and future year.

April 22, 1999

Massachusetts Environmental Protection Agency
1 Winter Street
Boston MA, 02108

Dear Secretary Durand:

We, the Cape Cod Legislative Delegation, write to you in determined support of proposed runway 14/32 at Logan International Airport. The transportation needs of our districts are inexorably linked to Logan airport in much the same way as every other region in eastern Massachusetts. Efficient operation of the Boston airport has immediate and measurable impact on economics and quality of life for Cape and Islands residents. For instance, Cape Air/Nantucket Airlines, the largest independent regional server in the country, flies 150,000 passengers to and from Boston each year. Passengers include Cape and Island residents traveling on business as well as those seeking medical procedures or other services unavailable locally. Moreover, air transport is central to the success of our tourism industry, one of the main sources of our constituent's livelihoods. In all, the unique geographic realities of the Cape and Islands wed our interests to events at Logan. Too often, delays in Boston become fully manifest in local consequences. We thank you for your consideration and do urge your favorable view of this initiative.

12.1

Respectfully Submitted,

THE CAPE COD LEGISLATIVE DELEGATION

Mr. John C. Silva
Manager, Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, Massachusetts 01803

Dear Mr. Pugsley and Mr. Silva:

As allowed by state and federal law, I submit to you comments regarding proposals put forth by the Massachusetts Port Authority and Federal Aviation Administration entitled, "Logan Airside Improvements Planning Project," in reference to proposed construction and augmentation of the General Edward Lawrence Logan Airport.

I have the distinct pleasure and honor of representing the residents of Winthop and part of Revere in the Massachusetts House of Representatives. Both in that capacity and as a resident of Winthrop myself, I have had a keen interest in matters concerning Logan Airport for many years. From that experience as well as from a careful review of all MassPort expansion proposals, I can say unequivocally and without hesitation that if the expansion planes are carried out, it will represent the single largest environmental attack the residents of communities which neighbor Logan have ever had to endure.

The primary reason for MassPort's undertaking of this course of action is its desire to reduce delays. It goes without saying that any reduction in delays at Logan Airport would benefit not only the local economy of the Greater Boston Area, but the economy of the entire Commonwealth as well. It should be stated that those who oppose

expansion at Logan do not, in any manner, oppose either delay reduction or economic growth. We do, however, oppose the method which MassPort has chosen to remedy the current delay-prone situation.

It is the contention of the Massachusetts Port Authority that without the proposed Airside improvements, Logan Airport will continue to experience increasing delays. This is true, however, even if all of the proposed construction were to be completed, Logan would still return to its present level of delays within five (5) years. While MassPort may dispute this number within a range of a few years, it is still an undeniable fact that as demand increases, delays will increase as well. Whether they rise at a slower or faster rate is an inconsequential question because it does not speak to a long-term, viable solution. In essence, MassPort is requesting to undertake a project which will degrade the environmental status of the region, (as I will describe latter), while not adequately addressing the underlying problem. This represents environmental harm perpetrated for less than practical, let alone justifiable, reasons. 13.1

The issue of noise and air pollution has many parallels to the issue of delays in the sense that the MassPort solution again provides only temporary relief. One need look no further than those who I represent in Winthrop and Revere to see that even people who would ostensibly benefit from the construction of an East/West runway realize the folly of expansion. Even with a 35% reduction in operation over their heads, in short order the number of operations, and thus, the level of noise pollution will be back to present levels and will continue to rise in the future. 13.2

In the mean time, communities affected by operations on Runways 33 and 27 including Charlestown, Chelsea, Revere, Somerville, Cambridge, Melrose, Roxbury, South Boston, Jamaica Plain, Roslindale, West Roxbury, Brookline and East Boston would see operations more than triple. While MassPort describes these increases as a more "equitable distribution" of noise and air pollution, I believe it is only a temporary shuffling of a problem which has been conceived based on limited concepts of "distribution." Add to this equation the fact that MassPort has no quantitative data regarding the actual pollutants expelled by aircraft, and the result is an expansion proposal which is proceeding on less than justified conclusions. 13.3

This question of distribution also speaks to a larger environmental concern; namely the concept of environmental justice. Given the undeniable fact that aircraft expel pollutants, it follows that an increase in air traffic will lead to an increase in pollutants. Why then should one region of the Commonwealth be made to suffer these increases when the benefit of expansion is clearly meant for the entire Commonwealth? I urge that consideration be given to those who have endured both noise and air pollution since the airport's inception, for they have already paid for economic progress by sacrificing their health and quality of life. 13.4

As you consider the concept of environmental equity, I further urge you consider other detrimental aspects of MassPort's expansion proposals other than the construction

of a new runway. One of these proposals, which I hold in extreme contempt based on its direct affect on the communities that I represent as well as its probable detriment to the Greater Boston area at large, is the construction of a centerfield taxiway. The orientation of this proposed taxiway will require aircraft be aligned such that their idling engines face directly toward Winthrop and Revere. It is no great scientific revelation that this orientation will result in increases in the pollutants present in Winthrop and Revere air. Moreover, a secondary but no less important issue is the simple fact that this taxiway will allow Logan Airport to increase its overall operations by freeing up piers at the various terminals. As has been stated before, any increase in operations will result in an increase in pollutants. 13.5

The Port Authority has also suggested that as part of its Airside Improvements it be allowed to apply to the Federal Aviation Administration to lower its minimum landing requirements. This would accomplish two goals, both of which would prove to be environmentally unsound. First, it would allow pilots to make a final landing decision at a lower altitude in inclement weather. A low decision altitude would necessarily mean that when a landing is aborted, the resulting engine power increase needed to execute a missed-approach would itself have to be initiated at a lower altitude. Put simply, when a missed approach is executed at a lower altitude, the result is more noise for the residents who live underneath the final approach pattern. Any lowering of minimums would necessarily lead to increased noise pollution in the immediate area. 13.6

In closing, let me restate my firm belief that expansion at Logan will necessarily entail increased environmental degradation and increased suffering for Logan's neighbors. Thank you for your consideration of my thoughts on this matter. Please call on me if I can be of any further assistance.

Very truly yours,

ROBERT A. DeLEO
State Representative

Code	Topic 1	Topic 2	Comment	Response
13.1	Purpose and Need	Delays	It is the contention of the Massachusetts Port Authority that without the proposed Airside improvements, Logan Airport will continue to experience increasing delays. This is true, however, even if all of the proposed construction were to be completed, Logan would still return to its present level of delays within five (5) years. Massport is requesting to undertake a project which will degrade the environmental status of the region, while not adequately addressing the underlying problem.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
13.2	Noise	Impacts	The issue of noise and air pollution has many parallels to the issue of delays in the sense that the Massport solution again provides only temporary relief. Even with a 35% reduction in operations over their heads, in short order the number of operations, and thus, the level of noise pollution will be back to present levels and will continue to rise in the future.	The ground noise analyses in Section 6.2.4 of the Airside Project Draft EIS/EIR lead to the opposite conclusion. For example, Table 6.2-21 of the Airside Project Draft EIS/EIR indicates that, at all seven sites examined, the reduction in exposure is greater under both the longer-term 37.5M High Fleet and 29M Low Fleet scenarios than it is under the near-term 29M Low Fleet scenario. Recent growth trends suggest the 37.5 million passenger level is now more likely to occur around 2015. (Refer to related discussion in Section 1.4.2 of the Supplemental DEIS/FEIR).
13.3	Noise	Impacts	Communities affected by operations on Runways 33 and 27 including Charlestown, Chelsea, Revere, Somerville, Cambridge, Melrose, Roxbury, South Boston, Jamaica Plain, Roslindale, West Roxbury, Brookline and East Boston would see operations more than triple. While Massport describes these increases as a more "equitable distribution" of noise and air pollution, I believe it is only a temporary shuffling of a problem which has been conceived based on limited concepts of "distribution."	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
13.4	Environmental Justice	Impacts	Given the undeniable fact that aircraft expel pollutants, it follows that an increase in air traffic will lead to an increase in pollutants. Why then should one region of the Commonwealth be made to suffer these increases when the benefit of expansion is clearly meant for the entire Commonwealth.	Section 6.4 of the Supplemental DEIS/FEIR contains a thorough analysis of air quality impacts from the Airside Project. The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.

Code	Topic 1	Topic 2	Comment	Response
13.5	Alternatives	Taxiway Improvements	The orientation of the proposed centerfield taxiway will require aircraft be aligned such that their idling engines face directly toward Winthrop and Revere. This orientation will result in increases in the pollutants present in Winthrop and Revere air. This taxiway will allow Logan Airport to increase its overall operations by freeing up piers at the various terminals. As has been stated before, any increase in operations will result in an increase in pollutants.	Refer to response to Comment 13.4. In addition, the NAAQS serve as an indicator of the acceptability of current pollutant concentrations since these standards were designed to protect human health and welfare. Dispersion modeling indicates that no alternatives violate the NAAQS.
13.6	Alternatives	Reduced Approach Minimums	The Port Authority has also suggested that as part of its Airside Improvements it be allowed to apply to the Federal Aviation Administration to lower its minimum landing requirements. It would allow pilots to make a final landing decision at a lower altitude in inclement weather. When a missed approach is executed at a lower altitude, the result is more noise for the residents who live underneath the final approach pattern. Any lowering of minimums would necessarily lead to increased noise pollution in the immediate area.	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.

Re: Logan Airside Improvements Planning Project
Draft Environmental Impact Statement/Report

Dear Mr. Puglsey:

I am writing to express my strong opposition to the proposal by the Massachusetts Port Authority to construct Runway 14/32 at Logan International Airport in Boston. Additionally, because the Draft Environmental Impact Statement/Report submitted by Massport contains several serious flaws, I strongly urge the Secretary to reject the DEIS/DEIR as inadequate and to require Massport to submit a new DEIS/DEIR.

1. Massport's delay projections are unreliable and appear to vastly overstate the extent of delays at Logan. 14.1

Massport's delay projections give the appearance of having been created to justify the construction of Runway 14/32. First, Massport apparently chose to develop its own model for estimating delays at Logan rather than relying on models used to estimate delays at other airports in the United States. There is inadequate discussion in the DEIS/DEIR on how its model were selected and developed.

Moreover, Massport uses 1993 as a base year, when delays were at a peak. Federal Aviation Administration data shows an 18% reduction in delays since that time. Additionally, Massport's model uses hourly weather observations from 1981-1990. Furthermore, Massport's delay calculations do not differentiate between the various causes of delays, including, in addition to delays caused by northwest wind conditions, delays caused by severe weather, the airlines, and delays at other airports.

Massport should be required to produce actual and current delay data derived from a universally accepted source such as the FAA. If Massport is permitted to use its own model to estimate delays, it should be required: 1) to explain how its model was selected and developed; 2) to use 1998 as a base year; 3) to use an updated 10-year average of hourly weather observation; and 4) to isolate delays caused by northwest wind conditions from delays from other causes. 14.1

2. The DEIS/DEIR does not adequately consider alternatives to the construction of Runway 14/32. 14.2

The DEIS/DEIR does not consider alternatives to the construction of Runway 14/32, including expanded use of Hanscom Field, especially for small aircraft, and construction of a second airport. It gives only superficial consideration to peak period pricing of landing fees. Massport should be required to consider these alternatives before being allowed to proceed with the construction of Runway 14/32.

3. The construction of Runway 14/32 is a short-term, "band-aid" solution to the problem of delays at Logan. Massport has no plan for dealing with long-term growth. 14.3

It appears that the construction of Runway 14/32 may reduce delays at Logan by as little as 20 percent. Moreover, according to Massport's own projections, even with the construction of Runway 14/32, delays will be back to current levels by 2005.

The DEIS/DEIR provides no plan for dealing with long-term growth at Logan and the resulting increase in delays. Additionally, it does not provide a comprehensive analysis of ground access, the parking freeze, and terminal capacity and how these critical components will affect increases in passengers and operations at Logan.

Massport should be required to extend the planning period from 2010 to 2020 with accompanying revisions in projected levels of activity and impact. Massport should be required to develop a detailed plan to shift most future growth in air traffic and passengers away from Logan. This plan should include specific goals and measures, including a major expansion of service and capacity at other airports in the region.

4. Massport cannot guarantee that Runway 14/32 will be unidirectional.

Massport has no legal authority to guarantee that Runway 14/32 will be unidirectional. Accordingly, Massport should be required to provide a detailed analysis of all impacts of Runway 14/32 based on the assumption it will be bi-directional. 14.4

5. There is inadequate mitigation for the severe environmental impacts the construction of Runway 14/32 will have on Logan's neighbors. 14.5

The construction of Runway 14/32 will result in a doubling or tripling of flights over a wide swath of metropolitan Boston. Massport offers no mitigation, such as soundproofing, to the vast majority of residents who will be affected by the increased noise caused by the new runway. Soundproofing is offered only to a small number of residents in very close proximity to Logan. Massport should be required to develop additional mitigation measures to reduce the noise impacts on the thousands of other residents who will be impacted by the new runway.

In summary, Runway 14/32 is a short-term, band-aid solution to an exaggerated problem. Its actual purpose appears to be to stimulate growth at Logan rather than reduce delays. It will result in severe negative impacts, especially a dramatic increase in noise, on many communities in and around Boston. The mitigation proposed by Massport is insufficient to reduce these impacts. Moreover, Massport has no long-term plan to address future increases in operations and passengers at Logan.

For all the reasons stated herein, Massport should not be permitted to proceed with the construction of Runway 14/32. The Secretary should reject the DEIS/DEIR as inadequate and require Massport to submit a new DEIS/DEIR that addresses the concerns raised in this letter.

Thank you for your consideration.

Sincerely,

Paul C. Demakis

Code	Topic 1	Topic 2	Comment	Response
14.1	Delay	Model	Massport's delay projections are unreliable and appear to vastly overstate the extent of delays at Logan. Massport should be required to produce actual and current delay data derived from a universally accepted source such as the FAA. If Massport is permitted to use its own model to estimate delays, it should be required: 1) to explain how its model was selected and developed; 2) to use 1998 as a base year; 3) to use an updated 10-year average of hourly weather observation; and 4) to isolate delays caused by northwest wind conditions from delays from other causes.	Sections 1.6 and 1.8 of the Supplemental DEIS/FEIR describe FAA and U.S. DOT measures of delay and their limitations, including historical data on delays at Logan Airport and other major United States airports, and discusses the estimation and modeling of flight delays. Regardless of the delay measure used, Logan Airport has consistently been one of the most delayed airports in the nation, ranking sixth in total delays and third in arrival delays in 1998. Historically, FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. In fact, delayed flights at Logan Airport, as measured by the FAA, increased by 30 percent in 1998. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994 and now Logan Airport is the third most delayed airport in the United States in terms of arriving flights. Because the FAA and U.S. DOT delay statistics only record historical delays, the FAA requires delay modeling when evaluating the future delay reduction benefits of airport capital improvements. The methodology used for the Airside Project provides a consistent and systematic estimate of flight delays caused by constraints at Logan Airport. The analysis based on this methodology indicates that: (1) flight delays at Logan Airport remain a significant problem and will become worse over time if no action is taken and (2) the Preferred Alternative can provide significant reductions in current and future delay levels. Consistent with the request made by EOEA in its Certificate, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. The methodology used for the Airside Project provides a consistent and systematic estimate of flight delays caused by constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The analysis based on this methodology indicates that: (1) flight delays at Logan Airport remain a significant problem and will become worse over time if no action is taken and (2) the Preferred Alternative can provide significant reductions in current and future delay levels. Comparative analysis of 1981 to 1990 weather with 1989 to 1998 weather identified no significant differences in statistical properties. Appendix I of the Airside Project Draft EIS/EIR contains a case study of delays under northwest wind conditions. Section 4.6 of the Supplemental DEIS/FEIR also presents information on delays under northwest wind conditions and includes and analysis of northwest wind delays in 1998.

Code	Topic 1	Topic 2	Comment	Response
14.2	Alternatives	Runway 14/32	The DEIS/DEIR does not adequately consider alternatives to the construction of Runway 14/32. Massport should be required to consider [Hanscom Field, construction of a second major airport and peak period pricing] before being allowed to proceed with the construction of Runway 14/32.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
14.3	Analysis Assumptions	Planning Period	The construction of Runway 14/32 is a short-term, "band-aid" solution to the problem of delays at Logan. Massport has no plan for dealing with long-term growth. Massport should be required to extend the planning period from 2010 to 2020 with accompanying revisions in projected levels of activity and impact. Massport should be required to develop a detailed plan to shift most future growth in air traffic and passengers away from Logan. This plan should include specific goals and measures, including a major expansion of service and capacity at other airports in the region.	An expanded and updated discussion of the regional alternatives is presented in Chapter 2 of the Supplemental DEIS/FEIR. Massport supports all the planned improvement projects that will enhance the attractiveness of the regional airports as alternatives to Logan Airport. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a description of the upcoming New England Airports System Study. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
14.4	Alternatives	Runway 14/32	Massport cannot guarantee that Runway 14/32 will be unidirectional. Massport should be required to provide a detailed analysis of all impacts of Runway 14/32 based on the assumption it will be bi-directional.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
14.5	Noise	Mitigation	There is inadequate mitigation for the severe environmental impacts the construction of Runway 14/32 will have on Logan's neighbors. Massport should be required to develop additional mitigation measures to reduce the noise impacts on the thousands of other residents who will be impacted by the new runway.	Chapter 8 of the Supplemental DEIS/FEIR summarizes Massport's proposed project-specific mitigation program associated with the Preferred Alternative including: Runway 14/32 would be designed, constructed, and operated to handle over-water operations only (unidirectional). Massport would seek to construct Runway 14/32 to reflect unidirectional use. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements. During the construction period an extensive array of traffic, air quality and noise mitigation measures will be employed to mitigate temporary construction impacts. A PRAS monitoring system to gather data and report on the actual achievement of PRAS. The objective of this system is to improve achievement of the PRAS goals and to provide a broader platform for disseminating of the monitoring results.

Robert Durand
Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA # 10458
100 Cambridge Street, 20th Floor
Boston MA 02202

Dear Secretary Durand:

I am writing to offer my comments on the proposed runway expansion for Logan Airport. The Logan Airside Improvements Planning Project, (EOEA # 10458), includes proposals to construct a new 5,000 foot runway, (Runway 14/32), to build a centerfield taxiway, and to lower arrival altitude minimums at the existing General Edward Logan Airport in Boston.

Before any construction can begin however, Massport is required to file its Environmental Impact Statement and Environmental Impact Report for approval by the Executive Office of Environmental Affairs in accordance with the Massachusetts Environmental Policy Act. Simply put, I believe that the studies are inadequate regarding the possible effects of these projects. I feel that Massport has taken a "band-aid" approach that does not begin to address the actual problems that Logan is experiencing and will continue to experience for the next twenty years. 15.1

In closing, I wish to express my strong opposition to the proposed Logan Airside Improvements Project and I would urge you to reject the Draft EIS/EIR.

Thank you and if I can provide any additional information please do not hesitate to contact me.

Sincerely,

Christopher G. Fallon
State Representative
Assistant Majority Leader

Letter 15
MA State Representative Christopher G. Fallon

Code	Topic 1	Topic 2	Comment	Response
15.1	Analysis Assumptions	Planning Period	I believe that the studies are inadequate regarding the possible effects of these projects. I feel that Massport has taken a 'band-aid' approach that does not begin to address the actual problems that Logan is experiencing and will continue to experience for the next twenty years.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals. Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

LETTER 16

April 16, 1999

Robert Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley EOEA No. #10458
100 Cambridge Street - 20 th Floor
Boston, MA 02202

Dear Secretary Durand,

My comments to the EIR-Logan Airside Improvements Plan EOEA #10458 are as follows: I am opposed to this plan. I have grave concerns about increased air traffic, noise and pollution which would result from this shortsighted proposal. EOEA should find significant planning deficiencies in Massport's Draft Environmental Impact Statement (DEIS), and require that it be withdrawn.

Logan Airport was constructed in a residential neighborhood. Massport should not be allowed to take a segmented approach to Logan's development. Landside improvement projects (which accommodate ground passenger handling) and airside improvement projects (which accommodate aircraft handling) are interrelated. Both generate increased traffic and pollution. Both must be included in any planning document. Massport must also accept ultimate responsibility for controlling passenger and cargo growth. They must not simply be presented as immutable forces of nature. 16.1 16.2

The EOEA and the FAA should require Massport to change the base year in its calculations to calendar year 1998 and revise all presentations in the DEIS/DEIR to reflect that. They should also extend the planning period from 2010 to 2020 and revise all the projected levels of activity accordingly. Outdated whether data should be replaced with current information. Massport should use the FAA's definition of delays in their work. The DEIS/DEIR should be republished to reflect all these changes. 16.3

The alleged benefits of this plan focus narrowly on the short term, namely a very small decrease in passenger delays. The plan sidesteps the long-term consequences of increased air traffic over Jamaica Plain, Roxbury and all of the surrounding neighborhoods. Massport also does not address the ultimate questions of the limits to 16.4 16.5

growth at Logan. What is the end limit to the number of take offs and landings that the airport can handle? How many passengers can the airport process? When do they expect to reach these limits, or is the airport going to continually expand until it further disrupts East Boston? What will this mean for the quality of life of all Boston neighborhoods?

We need to explore a regional, comprehensive transportation plan. Such a plan must include consideration of another location for a second airport, as well as steering air traffic to Hanscom and Worcester. As a constituent wrote, we also need to divert air travelers to the new Amtrack high speed train between Boston, New York and Washington D.C. We also need to build the North South rail Link between North and South Stations. Perhaps the increased use of video conferencing can replace the need for some business travelers to fly into Logan. 16.6

Massport needs to study the reasons for the perceived increase in demand for air traffic and find more creative alternatives besides building another runway. Perhaps Massport should take a page out of the book of the electric utility companies. Some of them have found that it is more desirable to give customers discounts on energy efficient light fixtures and thereby reduce demand, than it would be to invest in building more plants to increase capacity. 16.7

There are many more problems with the DEIS regarding noise, environmental impacts, construction impacts, endangered species, soundproofing, flight tracks, night time operations and etc. Without going into more detail, I believe that the case has already been made that the DEIS must be withdrawn and rewritten. It should answer each of the specific problems and questions brought up in the Community Advisory Committee review.

Thank you for your attention in this very important matter. If you have any questions regarding this testimony, please contact me at my office at (617) 722-2250.

Sincerely,

Kevin W. Fitzgerald
State Representative

Letter 16
MA State Representative Kevin Fitzgerald

Code	Topic 1	Topic 2	Comment	Response
16.1	Environmental Review Process	MEPA	Massport should not be allowed to take a segmented approach to Logan's development. Landside improvement projects (which accommodate ground passenger handling) and airside improvement projects (which accommodate aircraft handling) are interrelated. Both generate increased traffic and pollution. Both must be included in any planning document.	The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's ESPR (formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport."
16.2	Alternatives	Operational Restrictions	Massport must also accept ultimate responsibility for controlling passenger and cargo growth.	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.

Code	Topic 1	Topic 2	Comment	Response
16.3	Analysis Assumptions	Base year	The EOEA and the FAA should require Massport to change the base year in its calculations to calendar year 1998 and revise all presentations in the DEIS/DEIR to reflect that. They should also extend the planning period from 2010 to 2020 and revise all the projected levels of activity accordingly. Outdated weather data should be replaced with current information. Massport should use the FAA's definition of delays.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historic perspective to the delay problem at Logan Airport and for use in model calibration. Section 4.6 of the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. It should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project is a comparison of the Preferred Alternative to the No Action Alternative. Delay and environmental impacts of the Airside Project were evaluated under a broad range of future operating conditions at Logan Airport. Current air traffic trends at Logan Airport, as described in the Supplemental DEIS/FEIR, indicate that the 37.5 M scenario level may not be reached until 2015, and the 45 M level may not occur until 2020 or beyond. The planning horizon considered in the airside analysis therefore extends well beyond ten years. Comparative analysis of 1981 to 1990 weather with 1989 to 1998 weather identifies no significant differences in statistical properties. Section 4.4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays. It includes a description of FAA and DOT delay measures, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data on delays at Logan Airport and other major United States airports. The FAA and DOT delay statistics only record (imprecisely) historical delays; they cannot predict future delays.
16.4	Noise	Impacts	The plan sidesteps the long-term consequences of increased air traffic over Jamaica Plain, Roxbury and all of the surrounding neighborhoods.	The Supplemental DEIS/FEIR indicates that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The PRAS goals were established based on a thorough public participation process in response to community noise concerns. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts.
16.5	Cumulative Impacts	Master Plan	Massport also does not address the ultimate questions of the limits to growth at Logan. What is the end limit to the number of take offs and landings that the airport can handle? How many passengers can the airport process? When do they expect to reach these limits?	Federal constitutional provisions (preemption, commerce clause, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the federal Airport Improvement Program grants which Massport receives restrict Massport's ability to control the number of aircraft operations at Logan Airport. Refer also to response to Comment 16.3.

Code	Topic 1	Topic 2	Comment	Response
16.6	Regional Transportation	Regional Airports	We need to explore a regional, comprehensive transportation plan. Such a plan must include consideration of another location for a second airport, as well as steering air traffic to Hanscom and Worcester. As a constituent wrote, we also need to divert air travelers to the new Amtrak high speed train between Boston, New York and Washington D.C. We also need to build the North South rail Link between North and South Stations. Perhaps the increased use of video conferencing can replace the need for some business travelers to fly into Logan.	Logan Airport is part of a regional system of airports that includes T.F Green/Providence, Worcester Regional and Manchester Airports. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field, consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR. Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester Airport, T.F. Green/Providence Airport and Worcester Regional Airport, preclude the need for a second major airport. Massport holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic. The acceptance of videoconferencing and other means of telecommunications by businesses as a substitute for air travel is largely dependent upon the quality of the available technology and private sector decisions outside the authority of FAA and Massport. Massport encourages such initiatives from state government and others.
16.7	Purpose and Need	Delays	Massport needs to study the reasons for the perceived increase in demand for air traffic and find more creative alternatives besides building another runway.	Refer to response to Comment 16. 5 and 16.6

100 Cambridge St., 20th floor
Boston MA 02202
attn: Arthur Pugsley

Dear Secretary Durand,

This letter is in brief response to the draft Environmental Impact Report for the proposed Airside Improvements Project for Logan Airport.

People in Somerville are already disturbed by the noise of airplanes approaching or leaving Logan Airport, and are worried about the possible tripling of overflights which may take place.

My view, after listening to presentations by proponents and opponents of the proposed Runway 14-32, is that the main result of that runway will be to increase traffic. Even with high-speed rail about to open, there will probably be an increased demand by people wanting to fly into Boston. My understanding is that this increase could be accommodated by changing from smaller to larger airplanes to carry the traffic. This would lead to less pollution, less noise, and fewer delays, without increasing the number of flights as much, although if all the planes are larger, they can approach the airport in closer succession. 17.1

So, you should be exploring ways to discourage smaller aircraft. Building Runway 14-32, which could be used only by such planes, would go in the opposite direction, encouraging the scheduling of flights accommodating fewer than 50 passengers. In other words, if you build it, they -- small aircraft -- will come. 17.2

I urge MassPort to explore the many cheaper and more environmentally sound ways to increase the number of passengers using Logan. I also urge you to consider plans for regional solutions, including other airports and rail. 17.3

Finally, delays at Logan result not only from delayed flights but from tunnel traffic. Better mass transit access, or diversion of some flights to Hanscom or Worcester, could help resolve this problem. 17.4

On behalf of my many constituents who have contacted me on this issue, I strongly oppose building 14-32 and thereby increasing air traffic dramatically over our city.

Sincerely,

Patricia Jehlen

17.1	Purpose and Need	Delays	Increased demand could be accommodated by changing from smaller to larger airplanes to carry the traffic. This would lead to less pollution, less noise, and fewer delays, without increasing the number of flights.	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.
17.2	Alternatives	Runway 14/32	Building Runway 14-32 would encourage the scheduling of flights accommodating fewer than 50 passengers.	Refer to Section 8.5 of the Supplemental DEIS/FEIR for a discussion of ways the unidirectional restriction can be enforced. Small aircraft can be accommodated on any runway configuration at Logan Airport. Runway 14/32 would simply allow Logan Airport to maintain its full VFR capacity in northwest wind conditions and will not provide a new capability to accommodate small aircraft, nor should it encourage additional investment in this type of equipment. Since Aviation Deregulation in 1979, airlines have been free to select their own markets, schedules and equipment without Federal, State or local intervention. Major factors in airline competition are frequency of service and number of markets served. Airlines schedule flights and select aircraft types based on profitability, not runway characteristics at a single airport in the network.

Code	Topic 1	Topic 2	Comment	Response
17.3	Regional Transportation	Regional Airports, Passenger Rail	... Massport should explore the many cheaper and more environmentally sound ways to increase the number of passengers using Logan. I also urge you to consider plans for regional solutions, including other airports and rail.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
17.4	Ground Transportation	Access to Logan Airport	Delays at Logan result not only from delayed flights but from tunnel traffic. Better mass transit access, or diversion of some flights to Hanscom or Worcester, could help resolve this problem.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent EDR (Annual Updates). Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Boston, MA 02202

RE: MEPA Project Number: **EOEA No. 10458**

Dear Secretary Durand:

I would like to be recorded in opposition to the proposed Logan Airside Improvements Planning Project as outlined in the Draft Environmental Impact Statement/Report by the Massachusetts Port Authority (Massport) and the Federal Aviation Administration (FAA). This report outlines the proposal plans to build a new runway 14/32, and to construct and operate a new Centerfield Taxiway.

As the State Senator for the First Suffolk district, I am ever aware of the health and safety hazards that face the impacted communities below the flight paths. I appreciate the opportunity to comment on this proposal.

Safety Issues

The flight paths of Logan Airport already present serious safety concerns for the residents of its surrounding communities. Not long ago, the Dorchester community experienced the crash of an airplane on Lonsdale Street. Several homes were destroyed, the pilot killed, and a permanent feeling of unease has remained. In addition, another incident occurred in the Cedar Grove section of Dorchester when an engine fell off an aircraft and landed near a development for the elderly. Incidents such as these remind the neighborhoods of Boston of the need for reducing the dangers presented by overhead aircraft. 18.1

Health Concerns

In addition to the dangerous risk of crashes, the neighboring communities of Logan Airport must also contend with air and noise pollution. We recently met with physicians and public health officials of the South Boston Health Center regarding relentless noise associated with over-head aircraft which they believe adversely impacts the health of local residents.

Although noise pollution has a major effect on the lives of the people neighboring the airport, it is not the only health risk involved. Massport has offered no meaningful attempt to measure the level of air pollution associated with the jet fuel emissions.

Increased air traffic will lead to more air pollution and various upper respiratory problems including asthma. The neighborhoods of South Boston, Dorchester and Roxbury all contend with unusually high incidents of these types of health problems. 18.2
Recently, I filed legislation that calls for the study of health impacts by Logan Airport on surrounding communities. Senate Docket Number 1878, *An Act Relative to a Public Health Study of the Impacts of Logan International Airport* would direct the Bureau of Environmental Health Assessment of the Department of Public Health to conduct an environmental risk assessment of health impacts of the airport on the communities. More specifically, it would examine the incidences of respiratory disease and cancer in these communities, as well as other health problems. Until we can ascertain the affects of the airport on its neighboring communities, I believe that it is dangerous to allow any further expansion at Logan.

Traffic Issues

Obviously, the further development of Logan International Airport will attract an increased number of vehicular traffic to our neighborhood streets. While specific truck routes have been created to divert trucks from our neighborhood streets, passenger cars have continued to use these residential communities as a cut-through 18.3
to the highway system. To date there has not been a traffic study or a mitigation plan proposed. This lack of acknowledgement of the traffic impact of Logan Airport on the neighborhoods is shortsighted and disrespectful.

We know Logan Airport is intrusive, noisy and relentlessly disruptive of our environment and health. Massport should seriously consider the resources of regional 18.4
airports before looking to expand Logan.

Once again, I thank you for the opportunity to comment on this matter. I urge the MEPA Unit of the Executive Office of Environmental Affairs to keep these issues in mind as you consider this document. Thank you for your consideration. If I can be of further assistance, please contact my office.

Sincerely,

STEPHEN F. LYNCH
State Senator

SFL/cp

Letter 18
MA State Senator Stephen F. Lynch

Code	Topic 1	Topic 2	Comment	Response
18.1	Alternatives	Runway Use	The flight paths of Logan Airport already present serious safety concerns for the residents of its surrounding communities. [There is a] need for reducing the dangers presented by overhead aircraft.	The first goal of the FAA and Massport is always to provide safe air transportation. Logan Airport has a tightly controlled system of flight tracks and procedures to prevent aircraft accidents. Runway 14/32 and the other proposed Airside improvements are designed to enhance safety and efficiency of traffic operations in the air and on the ground. The runway will segregate smaller aircraft and reduce congestion during northwest wind conditions, reducing the possibility of mistakes and potential for accidents.
18.2	Public Health	Health Effects	Increased air traffic will lead to more air pollution and various upper respiratory problems including asthma. The neighborhoods of South Boston, Dorchester and Roxbury all contend with unusually high incidents of these types of health problems. Until we can ascertain the affects of the airport on its neighboring communities, I believe that it is dangerous to allow any further expansion at Logan.	Public health is discussed in Section 6.8 of the Supplemental DEIS/FEIR. Dispersion modeling for the air quality analysis indicates no violation of the NAAQS, which were designed to protect human health and welfare.
18.3	Ground Transportation	Access to Logan	Further development of Logan International Airport will attract an increased number of vehicular traffic to our neighborhood streets. Passenger cars have continued to use these residential communities as a cut-through to the highway system. To date there has not been a traffic study or a mitigation plan proposed.	The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis.
18.4	Regional Transportation	Regional Airports	Massport should seriously consider the resources of regional airports before looking to expand Logan.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

Arthur Pugsley
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge Street, 20th floor
Boston MA 02202

Dear Mr. Pugsley;

I am writing to voice my strong opposition to the Massport plans to build a new runway (Runway 14/42) and redesign taxiways at Logan Airport. I am requesting that MEPA deny approval of the draft Environmental Impact Statement (EIS) submitted by Massport to implement their proposal.

As the State Representative for parts of Jamaica Plain, Dorchester, Roslindale and Roxbury, I urge you to take into consideration the fact that much of the data used by Massport to justify their request is questionable in its accuracy, and in fact raises many more questions than it answers.

The transportation needs of New England and the greater Boston area are extremely complex and should be addressed in a comprehensive, regional manner. Although well intentioned, Massport's new runway proposal falls far short of offering any substantial solutions to those needs. The addition of a new runway at Logan will only encourage the expansion of an already too large airport in a too dense urban neighborhood. It is impossible to believe that resulting noise and air quality issues won't have a disastrous effect on residents in the immediate and surrounding communities. I am also alarmed that no effort was made in this report to measure the impact of increased road and ground traffic. 19.1 19.2

Unfortunately, a major opportunity to explore specifics of other potential solutions to our air and general transportation needs was lost in rushing this study to completion. As an elected official with an extremely diverse district to represent, I believe it would be irresponsible of me to not oppose Massport's request until we have all had an opportunity

to both study alternatives and answer the many health and public safety questions that have been raised.

I appreciate the opportunity to express my concerns and thoughts in this matter. Thank you for your attention to this matter.

Sincerely,

LIZ MALIA
State Representative

Code	Topic 1	Topic 2	Comment	Response
19.1	Alternatives	Runway 14/32	The addition of a new runway at Logan will only encourage the expansion of an already too large airport in a too dense urban neighborhood. It is impossible to believe that resulting noise and air quality issues won't have a disastrous effect on residents in the immediate and surrounding communities.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR. The emissions inventories for future conditions and alternatives are contained in Section 6.4 of the Supplemental DEIS/FEIR. These inventories show that all Alternatives, including the Build and No-Build Alternatives, are well within acceptable criteria. In addition, dispersion modeling indicates no violation of the NAAQS for the pollutants analyzed (CO, NO and PM_{10}) under any alternative and future year.
19.2	Ground Transportation	Access to Logan	I am also alarmed that no effort was made in this report to measure the impact of increased road and ground traffic.	The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis.

REDISTRICTING (VICE-CHAIR)

April 14, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley- EOEA No. 10458
100 Cambridge Street, 20th Floor
Boston, Massachusetts 02202

Dear Mr. Pugsley:

I would like to take this opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Logan Airside Improvements Planning Project. After reviewing the DEIR and attending various meetings on this matter I am writing to oppose the proposed runway 14/32 at Logan Airport.

I have reviewed the DEIR and Draft Environmental Impact Statement (DEIS) for the Logan Airside Improvements Planning Project and it is an incomplete document that needs to be re-drafted. The data and studies used to project the necessity of the new runway were out-of-date, using 1993 as a base year and therefore unreflective of the current situation. For instance, the Airside delay model (DELAYSIM) used hourly weather observations from 1981-1990. Due to the effects of El Nino and La Nina the weather patterns have changed significantly within the last five years and this information is no longer relevant. The study should construct and use a new 10-year average. There are contradictions in the calculations of delays as well. Massport developed their own model for estimating delay, rather than using the Federal Aviation Administration (FAA)-approved SIMMOD model. The FAA shows the delay situation at Logan has improved by decreasing by 36% between the years 1993 and 1997. 20.1 20.2

The DEIR does not include studies of other sources of delay that plague Logan Airport. The problems of parking and ground access are critical issues to getting people in and out of Logan quickly and efficiently. These issues will be even more crucial with the forecasted dramatic increases in passengers and operations at Logan. Terminal capacity and the baggage claim areas are also topics of concern. These areas have been improved, but with the projected increase in passengers there will be a need for more improvements down the road. The previously mentioned issues should have been studied as well, to see how much of an impact on 20.3

delays they actually have. When addressing the problem of delays, the whole operation of Logan needs to be taken into consideration, not just the weather.

The DEIR also failed to include studies of alternative plans in additional to the proposed runway 14/32. There is no mention of the impact of using several regional airports to relieve some of the traffic flowing into Logan Airport from across the state. Many citizens from the central and southeastern parts of the state drive hours to get to Logan when there are airports with the potential to be competent air service providers within a half-hour or less. In Worcester, Hyannis, and New Bedford there are airstrips, that with improvements could provide the state with the regional air transportation it needs. However, the DEIR did not mention these regional airports and the impact they would have on Logan, particularly in the area of delays. 20.4

There have been improvements in regard to delay at Logan Airport. As mentioned earlier there has been a 36% decrease in delays from 1993 to 1997. The FAA has further reported that 1998 delays were 18% lower than 1993 levels, this information was not included in the DEIR. These reductions in delays occurred without the implementation of any airside improvements. The thought of constructing the new runway to reduce weather-related delays actually has the effect of increasing the all-weather capacity of the airport; thus allowing for additional aircraft operations. Massport officials have said this is a short-term solution. The DEIR makes no long-term analysis of growth and delay problems at Logan, ending its analysis at the year 2010. By that date, with the new runway, and use of its proposed regional alternatives, Massport still projects delays to have increased by 39,000 hours annually. The Commonwealth needs a long-term solution we can not go through this same situation ten years down the road; we need to plan for the future of the Commonwealth now. 20.5 20.6

My constituents have their own concerns about the construction of the new runway. Several people were outraged that taxpayers dollars were funding the publicity campaign in favor of the new runway, when most people are opposed. Many people feel that Massport is resorting to a divide and conquer strategy when dealing with surrounding communities. By stressing to communities that they will see a reduction and pitting them against the other communities that will see an increase, in order to gather enough support for the proposal to pass.

Other constituents do not trust Massport and see this runway as a way to increase the number of aircraft coming and going at Logan and ultimately increasing the noise over their neighborhoods. This is in no way a case of "not in my backyard"; these people have lived with Logan for over 23 years, they simply can not take any more. Massport has talked about soundproofing the areas that receive the most noise pollution. Did they think about how many homes that will include? This does not seem feasible and even if it is, this does not resolve the problem when people want to use their backyards or when the windows are open. 20.7

As you can see there are many unresolved issues pertaining to the proposed runway 14/32 at Logan Airport. Many things were left out of Massport's DEIR that are pertinent to the discussion of the new runway. Citizens of the Commonwealth deserve all the facts since the decision will be effecting their daily lives. There was not enough exploration into supporting the regional airports and making them alternate locations for air service. We should spread the access and the noise that goes with it, around the region, not just around Boston. This will solve several problems at once. The delay and congestion issues will be improved by diverting travelers to other airports. The residents surrounding the airport will get a slight break with a reduction in noise from aircraft flying over their homes. In addition, travelers that live far from Boston will have closer alternatives with possible cheaper prices. 20.8

I respectfully request that you reject Massport's Draft Environmental Impact Report and solicit a more complete study of the proposed plan. This matter needs to be studied from all angles using up-to-date data in order to project what future situations might hold. Your consideration of this matter is greatly appreciated. If you have any questions or need additional information, please do not hesitate to contact me at my office.

Very truly yours,

Michael W. Morrissey
Senator Norfolk and Plymouth District

Letter 20
MA State Senator Michael W. Morrissey

Code	Topic 1	Topic 2	Comment	Response
20.1	Analysis Assumptions/ Methodologies	Base Year	The data and studies used to project the necessity of the new runway were out-of-date, using 1993 as a base year and therefore unreflective of the current situation. For instance, the Airside delay model (DELAYSIM) used hourly weather observations from 1981-1990. Due to the effects of El Nino and La Nina the weather patterns have changed significantly within the last five years and this information is no longer relevant. The study should construct and use a new 10-year average.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historic perspective to the delay problem at Logan Airport and for use in model calibration. Section 4.6 of the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. It should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project is a comparison of the Preferred Alternative to the No Action Alternative. Comparative analysis of 1981 to 1990 weather with 1989 to 1998 weather identifies no significant differences in statistical properties.
20.2	Delay	Model	There are contradictions in the calculations of delays as well. Massport developed their own model for estimating delay, rather than using the Federal Aviation Administration (FAA)-approved SIMMOD model.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports.
20.3	Ground Transportation	Access to Logan Airport	The DEIR does not include studies of other sources of delay that plague Logan Airport. The problems of parking and ground access are critical issues to getting people in and out of Logan quickly and efficiently... with the projected increase in passengers there will be a need for more improvements down the road. When addressing the problem of delays, the whole operation of Logan needs to be taken into consideration, not just the weather.	The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis. Massport has implemented an aggressive airport access program designed to increase the use of public transport modes and decrease the reliance on private automobiles to access Logan Airport. The impact of the passenger activity levels, used in the Airside Project documents, on ground access patterns was studied and reported in previous GEIRs. The GEIR analysis indicates that the projected growth can be accommodated by Logan Airport. In addition, Section 2.7 of the Supplemental DEIS/FEIR discusses the proposed MBTA improvements in transit access to Logan Airport. Ground access and mass transit access to Logan Airport was also discussed in the *Logan Airport 1999 ESPR*. The *1999 ESPR* was filed on December 15, 2000.

Code	Topic 1	Topic 2	Comment	Response
20.4	Regional Transportation	Regional Airports	The DEIR also failed to include studies of alternative plans in additional to the proposed runway 14/32. There is no mention of the impact of using several regional airports to relieve some of the traffic flowing into Logan Airport from across the state.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. As the analysis in Chapter 2 of the Supplemental DEIS/FEIR indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because a third operating runway is not available during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
20.5	Purpose and Need	Delays	There have been improvements in regard to delay at Logan Airport. As mentioned earlier there has been a 36% decrease in delays from 1993 to 1997. The FAA has further reported that 1998 delays were 18% lower than 1993 levels, this information was not included in the DEIR.	The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States. Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. Refer also to response to Comment 85.4. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals
20.6	Analysis Assumptions/ Methodologies	Planning Period	The DEIR makes no long-term analysis of growth and delay problems at Logan, ending its analysis at the year 2010. By that date, with the new runway, and use of its proposed regional alternatives, Massport still projects delays to have increased by 39,000 hours annually. The Commonwealth needs a long-term solution we can not go through this same situation ten years down the road.	Delay and environmental impacts of the Airside Project were evaluated under a broad range of current and future activity levels at Logan Airport. Current air traffic trends at Logan Airport, as described in the Supplemental DEIS/FEIR, indicate that the 37.5 M level may not be reached until 2015, and the 45 M level may not occur until 2020 or beyond. The planning horizon considered in the airside analysis therefore extends well beyond ten years. Refer also to response to Comment 20.4.

Code	Topic 1	Topic 2	Comment	Response
20.7	Noise	Sound Insulation	Massport has talked about soundproofing the areas that receive the most noise pollution. Did they think about how many homes that will include? This does not seem feasible and even if it is, this does not resolve the problem when people want to use their backyards or when the windows are open.	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences. Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
20.8	Regional Transportation	Regional Airports	There was not enough exploration into supporting the regional airports and making them alternate locations for air service. We should spread the access and the noise that goes with it, around the region, not just around Boston. This will solve several problems at once. The delay and congestion issues will be improved by diverting travelers to other airports. The residents surrounding the airport will get a slight break with a reduction in noise from aircraft flying over their homes. In addition, travelers that live far from Boston will have closer alternatives with possible cheaper prices.	Refer to response to Comment 20.4.

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202

Dear Secretary Durand,

I write to you today to express my opposition to peak period pricing at Boston/Logan International Airport. 21.1

The Cape, as you know, faces many complex transportation issues. Air travel has increased over the years and provides a vital alternative to automobile travel. The demand for these types of alternatives is rising annually. There is no reason we should be contemplating increasing fees on these methods of travel.

Additionally, small rural airports are usually served by smaller airlines. This type of financial hardship will only serve to force these airlines to increase their fares, and eventually put them out of business.

I have spent a tremendous amount of my time on transportation projects throughout the state. I am wholeheartedly committed to promoting alternative modes of transportation in areas, such as the Cape Cod and the South Shore, where roads and bridges are at peak level capacity. I am hopeful you will safeguard what little transportation alternatives exist in the areas and oppose peak period pricing.

Thank you for your attention to this matter.

Sincerely yours,

THERESE MURRAY
State Senator
Plymouth and Barnstable District

21.1	Alternatives	Peak Period Pricing	...express my opposition to peak period pricing at Boston/Logan International Airport. The Cape, as you know, faces many complex transportation issues. Air travel has increased over the years and provides a vital alternative to automobile travel. The demand for these types of alternatives is rising annually. There is no reason we should be contemplating increasing fees on these methods of travel. Small rural airports are usually served by smaller airlines. This type of financial hardship will only serve to force these airlines to increase their fares, and eventually put them out of business.	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. Previous attempts at differential landing fee programs at Logan Airport and the analysis presented in the *1993 Strategic Assessment Report* are described in Section 3.5 of the Supplemental DEIS/FEIR. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This Exemption Program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

LETTER 22

April 23, 1999

Mr. Arthur Pugsley
Associate Environmentalist, MEPA
Executive Office of Environmental Affairs
100 Cambridge Street, Suite 2000
Boston, MA 02202

RE: Draft Environmental Impact Statement/Report, Logan Airside Improvements Planning Project, February, 1999 (EPA Number D-FAA-B51017-MA)

Dear Mr. Pugsley:

I would like to express my concerns with the Draft Environmental Impact Statement/Report (DEIS/R) prepared by the Massachusetts Port Authority regarding the Authority's plans to construct what is commonly called Runway 14/32.

The DEIS/R has failed to address adequately the concerns of Chelsea and Charlestown residents under Logan International Airport's flight paths. Massport projects at least a threefold increase of flights over my district under the air traffic management plans based on construction of Runway 14/32. This is a heavy burden for communities already suffering a disproportionate level of industrial burdens, communities long excluded from many federal and state soundproofing and other mitigation efforts. 22.1

Significant questions remain about the methodology Massport used in preparing the DEIS/R, including how they calculated the flight delay rate, the heart of their argument for Runway 14/32, and how Massport came to the curious conclusion that communities such as Chelsea and Charlestown do not suffer disproportionately from their operations. I respectfully request that you reject the Massachusetts Port Authority and Federal Aviation Administration's DEIS/R for the proposed airside improvements at Logan International Runway. I further request that you do whatever is in your capacity to require the Commonwealth of Massachusetts to create an 22.2

independent commission to conduct a fair and comprehensive assessment of our regional air transportation needs.

Thank you very much for your attention to this important matter. Please do not hesitate to contact me if you have any question about my comments or concerns.

Very truly yours,

Eugene L. O'Flaherty

EUGENE L. O'FLAHERTY
State Representative, 2nd Suffolk District

Letter 22
MA State Representative Eugene L. O'Flaherty

Code	Topic 1	Topic 2	Comment	Response
22.1	Alternatives	Runway 14/32	The DEIS/R has failed to address adequately the concerns of Chelsea and Charlestown residents under Logan International Airport's flight paths. Massport projects at least a threefold increase of flights over my district under the air traffic management plans based on construction of Runway 14/32.	PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere. No one in Chelsea or Charlestown currently experiences noise that is this high.
22.2	Delay	Model	Significant questions remain about the methodology Massport used in preparing the DEIS/R, including how they calculated the flight delay rate.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports. The methodology used for the Airside Project provides a consistent and systematic estimate of flight delays caused by constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The analysis based on this methodology indicates that: (1) flight delays at Logan Airport remain a significant problem and will become worse over time if no action is taken and (2) the Preferred Alternative can provide significant reductions in current and future delay levels. The FAA, who co-authored the Supplemental DEIS/FEIR, approved all the models, which have been validated in previously published studies of Logan Airport.

LETTER 23

Arthur Pugsley
Associate Environmentalist
MEPA Unit–Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202

Subject: Comments Regarding EOEA #10458, Logan Airside Planning Project

Dear Mr. Pugsley:

The following comments regarding EOEA #10458, Logan Airside Planning Project are respectfully submitted.

To begin, I have eliminated the word "Improvements" from the official title of this project as an intrinsic distortion of the report's contents. I recommend "Expansion" as an appropriate substitute, in the spirit of accuracy.

• I am unalterably opposed to the proposed unidirectional Runway 14/32. This new runway would more than triple jet flights over some of the most densely populated communities in the region, including the Eagle Hill neighborhood in East Boston. Because these areas already suffer from some of the highest levels of Logan airport jet noise it is simply unacceptable to increase their noise exposure by tripling the number of jet flights on Runway 15R/33L which would result directly from the planned Runway 14/32. 23.1

The tripling of jet flights over these communities is documented in Massport's own draft environmental impact statement/report that is the subject of this review. For example, in Volume III, Technical Appendix H, pages 2 through 4 the data clearly demonstrate that ***total jet operations, arrivals and departures, on existing Runway 15R/33L would more than triple in Alternative 1A compared to Alternative 4.*** Alternative 1A is Massport's preferred alternative that is based on the unidirectional Runway 14/32 while Alternative 4 is current airport configuration. Jet operations from Runway 15R/33L are the main source of aircraft noise exposure for these residential communities.

ANTHONY PETRUCCELLI
STATE REPRESENTATIVE
57 COTTAGE STREET, EAST BOSTON, MA 02128
617.568.9158
WWW.PETRUCCELLI99.COM

I am opposed to Runway 14/32 for other reasons:

Runway 14/32 points directly at East Boston's most densely populated neighborhood, Jeffries Point, which currently is not subjected to direct overflights although the area suffers heavily from aircraft ground noise. Massport claims in the DEIS/R that Jeffries Point will not experience Runway 14/32 overflights because it will be designated as a unidirectional runway with overwater operations only.

However nowhere in the DEIS/R does Massport describe the irreversible legal instruments that would be necessary to guarantee against any future reversal of a temporary unidirectional runway operation. In fact statements on pages P-4 and P-5 in the section entitled Massport – FAA Roles make it clear that any runway operational restrictions put in place today would be subject to future modification pending application from Massport to the FAA when both agencies will be administered by different policy makers. 23.2

Runway 14/32 would jeopardize Jeffries Point even in a unidirectional configuration due to the inevitable overflights resulting from missed approaches to Runway 32 which would pass directly over the neighborhood. 23.3

• I am opposed to the proposals to reduce the bad weather instrument landing system (ILS) mimimums on Runways 15R, 27 and 22L. The effect of these actions would be to expose residential communities to increased jet flight noise from the additional jet overflights attendant on the increased availability of these runways to operational usage compared to existing conditions. This negative environmental effect is described in the DEIS/R, Volume III, Technical Appendix D, page 2: *"The proposal to reduce the ILS minimums to the lowest allowable for these three runways would increasre their annual availability, and allow operations to continue during periods of low visibility..."* 23.4

However I do support the proposal to reduce the Runway 33L ILS minimums because this might shift some bad weather landings from overland to overwater approaches. 23.5

ANTHONY
PETRUCCELLI
STATE REPRESENTATIVE

57 COTTAGE STREET, EAST BOSTON, MA 02128
617.568.9158
WWW.PETRUCCELLI99.COM

• I am opposed to the centerfield taxiway proposal because of it's potential negative noise impacts on the Orient Heights area of East Boston, particularly the Bayswater Street neighborhood. 23.6

The DEIS/R is deficient in that in does not adequately address alternatives to the alleged Logan Airport delay problem which is the basis of the proposed expansion plan. A regional airport system plan is called for which would fully utilize the potential of other regional airports such as Providence, RI and Manchester, NH. 23.7

I am also opposed to the DEIS/R because it completely fails to address the larger problem of airport related activities on the quality of life of East Boston. The existing growth rate of Logan Airport threatens to suffocate our community with air freight warehouses, heavy truck traffic, rental vehicles and other similar activities. I again call on the Massachusetts Office of Environmental Affairs to immediately institute a complete freeze on all Logan airport related activities in East Boston to protect our community from being totally overwhelmed by the airport. 23.8

Sincerely,

Anthony Petruccelli

Anthony Petruccelli

Letter 23
MA State Representative Anthony Petruccelli

Code	Topic 1	Topic 2	Comment	Response
23.1	Alternatives	Runway 14/32	Runway 14/32 would more than triple jet flights over some of the most densely populated communities in the region, including the Eagle Hill neighborhood in East Boston. Because these areas already suffer from some of the highest levels of Logan Airport jet noise it is simply unacceptable to increase their noise exposure by tripling the number of jet flights on Runway 15R/33L which would result directly from the planned Runway 14/32.	While Eagle Hill is expected to experience significant noise exposure above 65 DNL for various future scenarios, it is *not* among the most highly exposed areas around Logan Airport. The most highly exposed areas are primarily in Winthrop and to the north of Logan Airport in East Boston and Revere (see Tables 6.2-5 and 6.2-24. As a consequence, with the increased flexibility in use of runways afforded by Runway 14/32, PRAS tends to recommend additional overflights of Eagle Hill so as to benefit more highly exposed areas experiencing levels of 70 or 75 DNL and above.
23.2	Alternatives	Runway 14/32	Nowhere in the DEIS/R does Massport describe the irreversible legal instruments that would be necessary to guarantee against any future reversal of a temporary unidirectional runway operation.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
23.3	Alternatives	Runway 14/32	Runway 14/32 would jeopardize Jeffries Point even in a unidirectional configuration due to the inevitable overflights resulting from missed approaches to Runway 32 which would pass directly over the neighborhood.	Runway 14/32 will be used primarily in VFR weather conditions. A missed approach, which is an exceedingly rare occurrence in VFR conditions, would not affect Jeffries Point because it would turn to the left.
23.4	Alternatives	Reduced Approach Minimums	I am opposed to the proposals to reduce the bad weather instrument landing system (ILS) minimums on Runways 15R, 27 and 22L. The effect of these actions would be to expose residential communities to increased jet flight noise from the additional jet overflights attendant on the increased availability of these runways to operational usage compared to existing conditions.	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.

Code	Topic 1	Topic 2	Comment	Response
23.5	Alternatives	Reduced Approach Minimums	I do support the proposal to reduce the Runway 33L ILS minimums because this might shift some bad weather landings from overland to overwater approaches.	The implementation of the Category III ILS for Runway 33L will be evaluated at a later date in a separate EIS upon completion of the Runway Safety Ends Improvement Project.
23.6	Alternatives	Taxiway Improvements	I am opposed to the centerfield taxiway proposal because of potential negative noise impacts on the Orient Heights area of East Boston, particularly the Bayswater Street neighborhood.	The ground taxi noise calculated for the northeast end of Runway 4/22, at locations in Winthrop and East Boston, show small to moderate *reductions* in ground noise of 2 to 3 dB for the Preferred Alternative when compared to the No Build Alternative (refer to Tables 6.2-15, 6.2-16, and 6.2-17 in the Supplemental DEIS/FEIR). This is true for average and for maximum propagation conditions and for all operational scenarios examined. The main reason for these noise decreases is the reduction of the number of taxiing aircraft waiting to takeoff on Runways 22L&R. The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on the taxiways reducing ground noise and emissions for close in residents of East Boston and Winthrop.
23.7	Regional Transportation	Regional Airports	The DEIS/R is deficient in that it does not adequately address alternatives to the alleged Logan Airport delay problem which is the basis of the proposed expansion plan. A regional airport system plan is called for which would fully utilize the potential of other regional airports such as Providence, RI and Manchester, NH.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
23.8	Alternatives	Impacts	I am also opposed to the DEIS/ R because it completely fails to address the larger problem of airport related activities on the quality of life of East Boston. The existing growth rate of Logan Airport threatens to suffocate our community with air freight warehouses, heavy truck traffic, rental vehicles and other similar activities.	The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's ESPR (formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport."

LETTER 24

COMMITTEES:
SENATE WAYS AND MEANS
HEALTH CARE
ENERGY

April 7, 1999

Massachusetts Environmental Protection Agency
1 Winter Street
Boston MA, 02108

Dear Secretary Durand:

I write to you in determined support of proposed runway 14/32 at Logan International Airport. The transportation needs of my district are inexorably linked to Logan airport in much the same way as every other region in eastern Massachusetts. Efficient operation of the Boston airport has immediate and measurable impact on economics and quality of life for Cape and Islands residents. For instance, Cape Air/Nantucket Airlines, the largest independent regional server in the country, flies 150,000 passengers to and from Boston each year. Passengers include Cape and Island residents traveling on business as well as those seeking medical procedures or other services unavailable locally. Moreover, air transport is central to the success of our tourism industry, one of the main sources of my constituent's livelihoods. In all, the unique geographic realities of the Cape and Islands wed our interests to events at Logan. Too often, delays in Boston become fully manifest in local consequences.

24.1

I thank you for your consideration and do urge your favorable view of this initiative.

Respectfully Submitted,

Henri S. Rauschenbach
State Senator
Cape & Islands district

LETTER 25

April 22, 1999

Arthur Pugsley
Executive Office of
Environmental Affairs
100 Cambridge Street
Boston, MA 02202
Attn: MEPA Office

Re: Logan Airside Improvements Planning Project, Boston, MA. EOEA #10458.

Dear Mr. Pugsley:

I am writing to comment on the Draft Environmental Impact Statement/Report (EIS/R) for the above project.

I have represented the South End and Lower Roxbury neighborhoods of Boston in the Massachusetts House of Representatives since 1983. I serve on the Joint Committee on Transportation in the Legislature. In 1995 and 1996 I attended the final meetings of the Runway 27 EIS Advisory Committee (That EIS was completed in 1996 and the FAA Record of Decision was signed in 1977. As of April of this year, the approved flight track for departures off Runway 27 is still not being flown accurately within the accepted flight corridor by the majority of planes).

I request the Secretary of Environmental Affairs find the Draft EIS/R inadequate and incomplete and order that the Draft EIS/R be withdrawn from further public consideration or processing pending the development of a meaningful participatory process for evaluation of alternatives to the Runway 14/32 proposal. I request the Secretary to ask also that for an equitable, comprehensive, long-term, air and ground and water transportation program for the region be adopted before any further consideration of this proposal or any other proposed expansion of or at Logan Airport.

I have come to these conclusions in regard to the Draft EIS/R and to Massport's handling of this process for the following reasons:

1. **The Airside Improvements Project will impose an unacceptable noise burden upon my constituents and other communities without any commensurate benefit either to Logan Airport or to the citizens of the Commonwealth.** The EIS/R argues a narrow case for construction of a new runway and taxiway without examining in appropriate detail how these construction projects will adversely affect the surrounding impacted communities. The EIS similarly fails to evaluate the effect of the increased demand which will be generated by the proposed construction project on its terminal facilities, baggage handling parking capacity, public transportation an road access at the airport. 25.1 25.2

2. **Massport's assertions about delay are questionable at best.** The Citizens Advisory Committee to Massport (CAC) has determined the Massport failed to use readily available data on delay from the FAA to support its representations about the severity of the problem at Logan. My community's representative on that body has convinced me that there is no basis for Massport's assertions about the new runway as a tool for delay reduction at the airport. To the contrary, it appears that the delay situation will worsen within 5 years or less while Logan will have subjected its neighbors to an environmental nightmare of noise and pollution. 25.3

I do not believe that delays at Logan airport justify this $20 million proposed short-term solution. I know that Logan has problems and that delays are one of them. But Massport has not explained to my satisfaction what causes whatever number of delays there are. Are they delays which are unavoidable due to storms and dangerous weather conditions? Are they caused by the airlines? By delays at other airports? By cargo and baggage handling and ground transportation problems? It is counterintuitive to say delays are the problem and then advocate increasing capacity at the airport. No one has demonstrated that delays at Logan have slowed down growth in Boston for the past ten years. 25.4

The burden of proof is on Massport. It has failed to articulate any standard for acceptable delay or growth at Logan. It has also failed to provide a long-term or comprehensive analysis of the general congestion at the airport. Almost all of the airfield delay data is simulated. Actual delay has decreased since 1993 according the CAC consultants and they question the discrepancy between FAA and Massport methodology. In any event, actual data on delay over the years is not presented. 25.5

3. **The EIS/R gives short shrift to fundamental environmental justice implications of the proposal.** It contains no detailed evaluation of the impacts of this project on minority and low-income populations living adjacent to the project. The document shows that Massport did not actively obtain the population and impact information required by the executive Order 12898 and the DOT Order regarding environmental 25.6

justice. **The only specific data presented is noise data, which compares** the projected noise impacts (which are significantly understated) in particular communities to the study area as a whole, rather than showing the discrepancies among and between various communities which are impacted by the project; and other impacts, such as the impacts from air pollutants and odor, are not addressed at all. The environmental justice information is presented in a way which suggests Massport simply "checking off" ~~His~~ requirement rather than attempting, in good faith, to provide a meaningful evaluation of the project on minority and low-income communities.

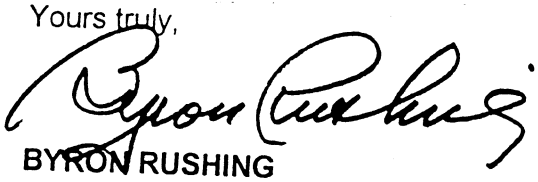
Furthermore, Massport has failed to perform any outreach to impacted non-English-speaking Latino residents in my Districts. There is a large community here, several thousand residents in Villa Victoria and in Lower Roxbury who will be severely and adversely impacted by this proposed runway construction project. Massport's failure to attempt any opportunity for comment by Spanish and Portuguese speakers is a direct violation of the Executive Order. 25.7

4. **The project, by Massport's own account in the DEIS, will generate, at best, limited, dubious and short term benefits for the traveling public while imposing onerous and permanent noise and pollution burdens on Massport's neighbors.** The Runway construction proposal is an ill-conceived stop-gap measure which would fundamentally alter the configuration and capacity of the airport and cause increased environmental injury to Logan's neighbors.

I cannot end these comments without mentioning the outrage expressed by many of my constituents regarding Massport's attempts to skew the process. **Massport's paid advertising campaign, during the public comment period, is an outrageous violation of the spirit of the environmental laws with which Massport nas to comply in order to receive approval for this project.** That it would engage in such a blatant attempt to influence the environmental process by purveying false and misleading information about the purposes and results of this complex project should, in itself, be viewed as grounds to reject the EIS/R. If left to stand, it will make a mockery of the environmental process itself. Many more people will have heard the false claims in the TV and radio advertising than will have had access to the Environmental Impact Statement. That Massport refused to hold educational meetings in many communities and failed to provide any information in the Spanish language while engaging in deceptive advertising should be severely sanctioned. In no event should Massport, or a group calling itself Citizens for Efficient Regional Transportation, be allowed to submit to MEPA any results from an alleged "survey" being conducted in conjunction with this

campaign. The "survey" is completely biased and uses invalid polling methods to come up with a result predestined to favor the project.

Yours truly,



BYRON RUSHING
State Representative

Letter 25
MA State Representative Byron Rushing

Code	Topic 1	Topic 2	Comment	Response
25.1	Noise	Impacts	The Airside Improvements Project will impose an unacceptable noise burden upon my constituents and other communities without any commensurate benefit either to Logan Airport or to the citizens of the Commonwealth. The EIS/R argues a narrow case for construction of a new runway and taxiway without examining in appropriate detail how these construction projects will adversely affect the surrounding impacted communities.	Section 4.3 of the Supplemental DEIS/FEIR contains a history of PRAS development and performance at Logan Airport. In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. Noise was identified as the only off-airport impact from the Preferred Alternative with the potential for environmental justice impacts. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. However, because the area added to the 65 dB DNL contour is primarily within the City of Chelsea, other environmental and health issues were also considered in an effort to assess other cumulative or multiple adverse exposures. Section 4.3 of the Supplemental DEIS/FEIR provides an evaluation of existing measures for monitoring PRAS performance and demonstrates that the FAA has improved its performance relative to the PRAS goals. The Preferred Alternative mitigation program includes additional reporting requirements recommended to enhance the monitoring effort.
25.2	Ground Transportation	Access to Logan Airport	The EIS fails to evaluate the effect of the increased demand which will be generated by the proposed construction project on its terminal facilities, baggage handling parking capacity, public transportation and road access at the airport.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport. The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis.

Code	Topic 1	Topic 2	Comment	Response
25.3	Delay	Model	Massport failed to use readily available data on delay from the FAA to support its representations about the severity of the problem at Logan. My community's representative on that body has convinced me that there is no basis for Massport's assertions about the new runway as a tool for delay reduction at the airport. To the contrary, it appears that the delay situation will worsen within 5 years or less while Logan will have subjected its neighbors to an environmental nightmare of noise and pollution.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. It includes a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.
25.4	Purpose and Need	Delay	Massport has not explained to my satisfaction what causes whatever number of delays there are. Are they delays which are unavoidable due to storms and dangerous weather conditions? Are they caused by the airlines? By delays at other airports? By cargo and baggage handling and ground transportation problems? No one has demonstrated that delays at Logan have slowed down growth in Boston for the past ten years.	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion by addressing constraints at Logan Airport. Delays caused by conditions at other airports or other factors, such as mechanical failure, are not addressed since Massport cannot influence these delays. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.

Code	Topic 1	Topic 2	Comment	Response
25.5	Delay	Model	Massport has also failed to provide a long-term or comprehensive analysis of the general congestion at the airport. Actual delay has decreased since 1993 according the CAC consultants and they question the discrepancy between FAA and Massport methodology. Actual data on delay over the years is not presented.	The Draft EIS and Supplemental DEIS/FEIR contain detailed analyses of congestion at Logan Airport for six future operating scenarios, which at current growth rates are expected to extend to the year 2024. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays which would be directly affected by Runway 14/32 have risen steadily since 1994. The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States. Logan Airport's estimated annual delay hours in 1998 were over six times the FAA's threshold of 20,000 hours for a severely delayed airport. Refer to Section 1.4 and Appendix C of the Supplemental DEIS/FEIR for a discussion of the FAA and DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.
25.6	Environmental Justice	Demographic Data	The EIS/R contains no detailed evaluation of the impacts of this project on minority and low-income populations living adjacent to the project. The document shows that Massport did not actively obtain the population and impact information required by the executive Order 12898 and the DOT Order regarding environmental justice. The only specific data presented is noise data, which compares the projected noise impacts (which are significantly understated) in particular communities to the study area as a whole, rather than showing the discrepancies among and between various communities which are impacted by the project; and other impacts, such as the impacts from air pollutants and odor, are not addressed at all.	Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR. Noise was identified as the only off-airport impact from the Preferred Alternative with the potential for environmental justice impacts. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. However, because the area added to the 65 dB DNL contour is primarily within the City of Chelsea, other environmental and health issues were also considered in an effort to assess other cumulative or multiple adverse exposures. Refer to Section 6.8.6 of the Supplemental DEIS/FEIR for additional information.

Code	Topic 1	Topic 2	Comment	Response
25.7	Environmental Justice	Demographic Data	Massport has failed to perform any outreach to impacted non-English-speaking Latino residents in my Districts. Massport's failure to attempt any opportunity for comment by Spanish and Portuguese speakers is a direct violation of the Executive Order.	Massport has involved the Hispanic community in public review of the Airside Project. Copies of the Airside Project Draft EIS/EIR were distributed to the Chelsea Human Services Collaborative, the Centro Hispano de Chelsea, and the Chelsea Commission on Hispanic Affairs. Consistent with FAA policy of providing translation on request, a Spanish-language interpreter was present at a meeting on February 23, 1999 with the Latin American Planning and Development Group. Massport also held a public hearing on March 3, 1999 with the Chelsea City Council at which over one hundred citizens had the opportunity to provide comment to Massport officials following a presentation of the Proposed Project.

The Commonwealth of Massachusetts
House of Representatives
State House, Boston 02133-1054

LETTER 26

April 23, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Mr. John C. Silva
Manager, Environmental Programs
Airports Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Pugsley and Mr. Silva:

Recognizing that the public comment period for the Draft Environmental Impact Statement/Report on the Logan Airside Improvements Planning Project is drawing to a close, and that Massport is preparing to move ahead with the next stage of the MEPA/NEPA process, I thought this an appropriate time to express my ideas and concerns about the Airside Improvements Planning Project as it is currently structured. I am writing to you as a member of the Joint Committee on Transportation and as an elected representative from the town of Braintree who has had an opportunity to fully review the plans for the Airside Improvements Planning Project.

It is evident that, due to the unique weather and wind patterns around Logan Airport, the airport is subject to delays, even on perfectly clear days. The current runway lay-out makes the airport especially vulnerable to delays, a problem that the proposed Runway 14/32 is designed to alleviate. Delays are understandably unpopular with travelers, especially with business travelers, and none of us want to see Logan so hobbled by schedule problems that Boston becomes known as a notoriously difficult destination. That would be harmful both to our economy and to our civic pride. Moreover, delays are also damaging to our environment, as planes idle on the tarmac and circle in the sky, all the while releasing foul fumes into the air.

Recognizing that delays are a serious impediment to the smooth and efficient management of operations at Logan Airport, we still need to ask some important questions about the Airside Improvements Planning Project, and especially about the long-term efficacy of any proposal that includes runway construction. The first and most obvious question is based on the assumption

that Runway 14/32 will be built: for how long will it be able to alleviate current and projected delays? Although Massport has attempted to answer this question, the Citizen's Advisory Committee has supplied me with alternative data, and I would like some clarification on this point. 26.1

Conversely, if we choose not to act on the Airside Improvements Planning Project at this juncture, where will Massport find itself in ten years or twenty years? If we do move ahead with the proposed plan, will this be the final piece in the overall puzzle of modernizing Logan? 26.2

The Draft EIS/EIR further claims that Runway 14/32, combined with the other improvements included in the Airside Improvements Planning Project, will "...allow noise impacts to be spread more equitably across communities and over water..."[1] This should offer much-needed relief for certain neighboring communities currently receiving the major share of noise and other impacts from Logan Airport, an effort I applaud.

In order to manage the current weather-related delays, it is clear Massport needs to make modifications to its existing operations. A reduction in the number of delays, coupled with a more equitable distribution of the impact of airport activities, is obviously a worthy goal. But it is important not to be short-sighted in our approach to improving Massport's current infrastructure. Massport needs to recognize the importance of taking a long-term, regional approach to air and ground transportation in the Commonwealth, including expanding the use of the airports in Worcester and New Bedford. These airports will never function on the same scale as Logan, but they can provide valuable service for their immediate communities. 26.3

The following is a list of points which should be addressed as Massport prepares to move forward with the Airside Improvements Planning Project:

- Any discussion of proposed Runway 14/32 must include conditions for it to be used only as a unidirectional runway. Massport has made this a part of the Draft EIS/EIR, but it must now demonstrate to the communities of the Citizens Advisory Committee that it is capable of making and keeping that commitment. Logan's neighbors will count on that promise to be maintained even as traffic grows at Logan. A firm committment to the unidirectional runway will not only help to limit the impact of airplane noise on the surrounding communities but will also add an important level of credibility to the proposal. 26.4

- Massport and the Federal Aviation Administration must seriously consider a long-term plan to expand the capacity of the Commonwealth's other airports, including Worcester Regional Airport. An increase in the use of our other airports would help to relieve some of the pressure on Logan. A number of options should be weighed, including relocating to one of the state's smaller airports a portion of the freight traffic and/or the private/corporate jet traffic that currently flows through Logan. 26.5

- The Commonwealth should work with the states of New Hampshire and Rhode Island, home respectively to Manchester Airport and T.F. Greene Airport, to develop a comprehensive tri-state plan for managing ground and air traffic in and out of New England. As both passenger and freight traffic in the region increase in the future, Logan will not be able to efficiently handle all of the air-traffic demand without assistance from airports in our neighboring states. 26.6

- To further assist those communities that may experience an increase in airplane noise from an increase in activity at Logan, Massport and the Federal Aviation Administration must establish an expanded noise abatement program, including increased funding for residential sound-proofing efforts. Massport and the Federal Aviation Administration should also explore the possibility of requiring planes using Logan's facilities to either be new and therefore less noisy or else to have been retrofitted for noise reduction. I understand that there are other urban airports in the country that have restrictions on the types of aircraft that can use their runways, a mechanism that Massport should consider. 26.7 26.8

- Massport should also work with the impacted communities to consider the possibility of establishing rules about hours of operation for Runway 14/32 that are acceptable to the residents of those communities as well as to the airport. Massport currently has certain rules about how late planes can fly in and out of Logan; those rules should be strengthened in response to community concerns about noise. 26.9

- As mentioned in Section 2.4.2.5. of the Draft EIS/EIR, Massport has worked to calculate the impact of Amtrak's new high-speed rail service on the number of people using Logan. I have seen and read several different figures for this projected impact, and I believe it's important to develop precise data. 26.10

- The issue of peak-hour pricing, which is covered in the Draft EIR/EIS and which has been a part of the public discussion on the Airside Improvements Planning Project, is a mechanism which I believe will not help to alleviate the current problem of delays at Logan Airport. It has been demonstrated to me that peak-hour pricing may do economic harm to some of the smaller airlines serving our region, those same carriers that the proposed Runway 14/32 is specifically designed to serve. For this reason, I believe that peak-hour pricing would not be an appropriate administrative choice for Massport at this point. 26.11

Over the past decade, the Commonwealth has worked aggressively to improve its transportation networks and to upgrade its existing transportation infrastructure. The opening of the Ted Williams Tunnel (T.W.T.), the direct connection between the Massachusetts Turnpike and the Ted Williams Tunnel, the progress of the Central Artery Project, and the modernization of the MBTA's Blue Line are all projects that have and will directly improve access to Logan Airport from downtown Boston and beyond. It is not an accident that these projects have been made a priority by the Commonwealth as they increase intermodal accessibility around the Greater Boston area. In order for these investments to have the maximum possible impact, however, it is vital that Logan be able to function as efficiently and smoothly as possible.

The proposed construction of Runway 14/32 and the Centerfield Taxiway is designed to alleviate current weather-related delays only. But projections show a growth in the number of trips to and from Logan, growth that will occur regardless of whether we move ahead with the Airside Improvements Planning Project. In a way, this is a good problem, because it demonstrates what we already know: that the Boston area is a wonderful place to spend time. Our rich history, thriving financial, educational, and health care sectors, as well as its proximity to the beaches of Cape Cod and the ski slopes of the Berkshires all make Boston a desirable destination. The new Convention Center, when it is completed, will be a further draw. We need to find a way to balance the projected and potential growth at Logan, however, with the quality of life concerns of the cities and towns under the Logan flight paths. This is not a case of 'build it and they will come,' for they are already coming. We need to address that fact in a manageable, efficient, and effective way.

At the same time, however, we must think about the long-term future of air travel in New England, and that requires us to plan more broadly. Therefore, must begin to incorporate the Commonwealth's smaller airports into our aviation network, whether for passengers or for freight, and we must look beyond our borders to airports in our neighboring states.

As one who travels through Logan Airport, and who tries to understand the myriad transportation programs of the Commonwealth, I know that access to safe, convenient, and affordable air travel is in the best interest of Massachusetts and New England as we move into the 21st century.

It is my hope that you will consider my thoughts in the sincere way that they have been offered.

Very Truly Yours,

Joseph C. Sullivan
State Representative
5th Norfolk District

cc: Mr. Peter Blute
Executive Director, Massport

26.1	Alternatives	Runway 14/32	For how long will Runway 14/32 be able to alleviate current and projected delays?	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
26.2	Purpose and Need	Delay	If we choose not to act on the Airside Improvements Planning Project at this juncture, where will Massport find itself in ten years or twenty years? If we do move ahead with the proposed plan, will this be the final piece in the overall puzzle of modernizing Logan?	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts.

Code	Topic 1	Topic 2	Comment	Response
26.3	Regional Transportation	Regional Airports	Massport needs to recognize the importance of taking a long-term, regional approach to air and ground transportation in the Commonwealth, including expanding the use of the airports in Worcester and New Bedford.	Extensive analysis of impacts of the 37.5 million scenario is discussed in detail in Chapters 5 and 6 of the Supplemental DEIS/FEIR. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport reports on the status of the New Bedford Airport Project in Section 2.6 of the Supplemental DEIS/FEIR.
26.4	Alternatives	Runway 14/32	Any discussion of proposed Runway 14/32 must include conditions for it to be used only as a unidirectional runway. Massport must now demonstrate to the communities of the Citizens Advisory Committee that it is capable of making and keeping that commitment.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
26.5	Regional Transportation	Regional Airports	Massport and the Federal Aviation Administration must seriously consider a long-term plan to expand the capacity of the Commonwealth's other airports, including Worcester Regional Airport. A number of options should be weighed, including relocating to one of the state's smaller airports a portion of the freight traffic and/or the private/corporate jet traffic that currently flows through Logan.	While Massport has no jurisdiction over the development, operation or use of infrastructure at airports other than Logan Airport, Hanscom Field, and Worcester Regional Airport (as of January 2000), Massport is engaged in promoting the use of other alternative regional airports and travel modes to relieve traffic growth pressures at Logan Airport. Refer to response to Comment 26.3. Since cargo operations account for only two percent of aircraft activity at Logan Airport and occur during off-peak hours, cargo operations do not contribute to delays at Logan Airport. General Aviation, including private jets comprise only 5 percent of Logan Airport operations. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users.
26.6	Regional Transportation	Regional Airports	The Commonwealth should work with the states of New Hampshire and Rhode Island, home respectively to Manchester Airport and T.F. Greene Airport, to develop a comprehensive tristate plan for managing ground and air traffic in and out of New England.	Refer to response to Comment 26.3.
26.7	Noise	Sound Insulation	Massport and the Federal Aviation Administration must establish an expanded noise abatement program, including increased funding for residential sound-proofing efforts.	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences.
26.8	Noise	Hushkitted Aircraft	Massport and the Federal Aviation Administration should also explore the possibility of requiring planes using Logan's facilities to either be new and therefore less noisy or else to have been retrofitted for noise reduction.	For over ten years, Massport has had several noise rules that have increased the proportions of quieter airplanes in the Logan Airport fleet. However, as of 2000, the FAA requires that almost all commercial aircraft comply with the Stage 3 FAR Part 36 noise certification standards which, up to now, have only applied to certain new aircraft types. As a result, almost all aircraft in the Logan Airport fleet in 2000 and subsequent years will be of the new quiet, Stage 3 types or hushkitted Stage 2 aircraft. Section 5.2 of the Supplemental DEIS/FEIR discusses the status of the use of hushkitted Stage 3 aircraft at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
26.9	Alternatives	Runway 14/32	Massport should also work with the impacted communities to consider the possibility of establishing rules about hours of operation for Runway 14/32 that are acceptable to the residents of those communities as well as to the airport. Massport currently has certain rules about how late planes can fly in and out of Logan; those rules should be strengthened in response to community concerns about noise.	The intent of Massport's Noise Rules, which were first drafted in the 1970s, was to minimize the exposure from Logan Airport's aircraft operations on residential areas. Since the Massport Noise Rules were first enacted, the National Noise Policy Act (the "Noise Act") was enacted as Federal law. Under the Noise Act, future amendments to Massport's Noise Rules or other types of airport access restrictions are subject to FAA review and require completion of a FAR Part 161 Study. Since the Noise Act was enacted, the FAA has not approved any Part 161 access restrictions proposed by airport operators.
26.10	Regional Transportation	Passenger Rail	It's important to develop precise data on the impact of Amtrak's new high-speed rail service on the number of people using Logan.	The analysis of regional alternatives presented in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR relies on air to high-speed rail diversion estimates published in the Supplemental DEIS/FEIR and Section 4(f) Statement, Northeast Corridor Improvement Project, prepared by the Federal Rail Administration in October 1994. In preparing the Supplemental DEIS/FEIR, Massport contacted Amtrak for more recent estimates, but Amtrak did not have any updated ridership estimates that could be released to Massport. Amtrak's written response to Massport's request for updated ridership numbers is contained in Appendix B of the Supplemental DEIS/FEIR.
26.11	Alternatives	Peak Period Pricing	The issue of peak-hour pricing, which is covered in the Draft EIR/EIS and which has been a part of the public discussion on the Airside Improvements Planning Project, is a mechanism which I believe will not help to alleviate the current problem of delays at Logan Airport. Peak-hour pricing may do economic harm to some of the 10 smaller airlines serving our region, those same carriers that the proposed Runway 14/32 is specifically designed to serve. For this reason, I believe that peak-hour pricing would not be an appropriate administrative choice for Massport at this point.	Refer to Section 4.5 of the Supplemental DEIS/FEIR for an expanded discussion of PPP. An exemption program designed to protect services to small communities most reliant on Boston for access to the national air transport system is described in Section 4.5.3 of the Supplemental DEIS/FEIR. The section provides an illustrative exemption program and its impact on the delay reduction potential of PPP. The analysis in the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR shows that, because PPP eliminates a small number of small aircraft operations, it does not produce any environmental benefits or impacts. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program. Previous attempts at differential landing fee programs at Logan Airport and the analysis presented in the *1993 Strategic Assessment Report* are described in Section 3.5 of the Supplemental DEIS/FEIR. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

LETTER 27

April 21, 1999

Robert Durand, Secretary
MEPA Unit Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

RE: **Draft Environmental Impact Report EOEA #10458**
Logan Airport Expansion

Dear Secretary Durand:

I am writing to express my strong opposition to the proposal of the Massachusetts Port Authority (Massport) for the expansion of Logan International Airport (Logan). The proposed expansion of Logan will have a devastating impact on the quality of life in my legislative district, particularly upon those who reside in East Somerville and East Cambridge.

If Massport moves forward on its proposal to expand Logan, the number of flights over East Somerville and East Cambridge will increase three-fold to approximately **20,000 operations each year**. The runway at Logan that most directly impacts my legislative district is 33L. Currently, runway 33L generates approximately 6,000 operations annually. However, with the proposed expansion, runway 33L usage -- and the resulting noise and air pollution -- will **triple**. It is unfair to require the predominantly working class neighborhoods to the West of Logan to shoulder so much of the burden of the proposed expansion. 27.1

Another major problem with the proposed expansion of Logan is the fact that at best this is a temporary solution to the delay problems there. By 2005 Logan will experience as many, if not more delays than in 1998 **with the proposed expansion,** according to Massport's own estimates. The short term relief that Massport's expansion proposal would provide does not warrant the permanent loss of quality of life for the residents of the communities to the West of Logan. 27.2

I agree that the Commonwealth has to take action to address the problem of increased air traffic in eastern Massachusetts. The best way to do this, however, is to follow the lead of our competitors to the South. Both New York City and Washington DC have secondary airports that can handle the increasing demand for air travel. It is time for the Commonwealth to explore the possibility of expanding one of the regional airports already in existence. This will accomplish two major goals: decreasing demand at Logan and more equitably distributing air traffic throughout the Commonwealth. Such a solution would be beneficial to the business interests as well as the human interests currently at stake. I strongly urge the MEPA unit to deny any permits for the expansion of Logan at this time. 27.3

Thank you for your attention to this very important matter.

Sincerely Yours,

Timothy J. Toomey Jr.

Letter 27
MA State Representative Timothy J. Toomey

Code	Topic 1	Topic 2	Comment	Response
27.1	Environmental Justice	Impacts	With the proposed expansion, runway 33L usage--and the resulting noise and air pollution--will triple. It is unfair to require the predominantly working class neighborhoods to the west of Logan to shoulder so much of the burden of the proposed expansion.	The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation. The environmental justice analysis found no disproportionately high and adverse impacts to low-income and minority populations from direct project impacts. Refer to Section 6.2 and Section 6.8 of the Supplemental DEIS/FEIR, respectively, for additional information on noise impacts and environmental justice.
27.2	Analysis Assumptions	Planning Period	Another major problem with the proposed expansion of Logan is the fact that at best this is a temporary solution to the delay problems there. By 2005 Logan will experience as many, if not more delays than in 1998 with the proposed expansion, according to Massport's own estimates. The short term relief that Massport's expansion proposal would provide does not warrant the permanent loss of quality of life for the residents of the communities to the West of Logan.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
27.3	Regional Transportation	Regional Airports	It is time for the Commonwealth to explore the possibility of expanding one of the regional airports already in existence. This will accomplish two major goals: decreasing demand at Logan and more equitably distributing air traffic throughout the Commonwealth.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful.

COMMONWEALTH OF MASSACHUSETTS
MASSACHUSETTS SENATE
STATE HOUSE, BOSTON 02133-1053

LETTER 28

SENATOR ROBERT E. TRAVAGLINI
SUFFOLK AND MIDDLESEX DISTRICT
ROOM 511
TEL. (617) 722-1634
FAX (617) 722-1076

SENATE MAJORITY WHIP

April 22, 1999

Robert Durand, Secretary
of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge St., 20th Fl.
Boston MA 02202

Dear Secretary Durand:

I write to offer comment on Massport's Draft EIR/EIS *Logan Airside Improvements Planning Project – EOEA No.10458.* The purpose of this project is expand operations at Logan International Airport. No matter how many times Massport states otherwise, this project would allow Massport to fly more planes in and out of its facility. The construction of a new runway at Logan Airport does nothing to enhance the quality of the environment, and in truth potentially has the ability to be very destructive. Representations that building the runway is a regional solution fail to ring true as Massport's proposal does not contain a regional airport plan or address the need for increased use of Hanscom Field and Worcester Municipal Airport. It also does not explore any plans for a second major airport within either Massachusetts or the New England region.

Massport, and the administration, should begin by relocating certain existing cargo operations from Logan to Hanscom and to make infrastructure improvements to Worcester Airport that will make both air fields viable alternatives to Logan Airport. In addition, more emphasis should be placed on developing and marketing other airports in the New England area including: New Bedford, Providence RI and Manchester NH. 28.1

If runway 14/32 is supposed to be a regional solution, then why is the brunt of airport operations being borne by residents of East Boston, Winthrop, Revere, Chelsea, the South End and South Boston? The real issue is when is enough, enough? The remedies proposed by Massport are stop gap measures that will be meaningless upon completion of the project. The proposal is supposed to assist in reducing delays at Logan airport, yet there is no break down regarding inevitable delays caused by New England weather, nor the delays caused by the airlines themselves which might be solved administratively. Massport's "preferred alternative" instead, 28.2

pits neighborhood against neighborhood and does not reduce noise but redistributes it temporarily and results in increased noise and operations in the long term.

In the document Massport states that "Alternatives 1 and 1A will allow for increased utilization of Runway 15/33 to levels more consistent with PRAS goals." Then the report goes on to state that the plan would "reduce total population within the most severe noise impact areas (i.e. 70 and 75 DNL contours), but will increase the noise exposed population at 65 dB or greater for all scenarios in comparison to Alternative 4." The No Action scenario appears to have less noise impact on the affected communities than any so-called benefit derived from constructing a new runway. There is also the question of Massport's definition of "noise impact areas", does this refer only to residences located within "noise contour" areas which are defined by Massport and submitted to the FAA or does this reflect residences which are actually receiving high levels of noise which can be documented by actual data? Complaints of increased noise seem to indicate many more residences being impacted than are currently subject to mitigation measures by Massport or located within a "sound contour". 28.3

By their own admission increases in expected passengers traveling through Logan Airport will result in more hours of delay than are experienced today, even with the addition of a new runway. Runway 14/32 does not begin to address the real problem – that Logan Airport is overextended and will not be able to handle the projected number of passengers who wish to fly to Massachusetts. 28.4

I also have many concerns relating to the actual construction of the new runway, the preferred options require a waiver from certain FAA minimum safety requirements. This requires further explanation and Options A and B which impact the Hyatt Harborside Hotel and Boston Harbor, respectively, should not even be on the table. Obviously the physical constraints of building 14/32 should be considered, if you need a waiver maybe it isn't an appropriate idea to build. In addition, throughout the document Massport contends that if the new runway isn't built that Logan will "become an airport that operates primarily in a North-South configuration". This is the current state of operations at Logan Airport, not something that will be created by an action or inaction on the part of Logan. 28.5 28.6

The portion of the DEIS/EIR which discusses cumulative impacts seems to minimize the reality of significant construction occurring in a very small area. The CA/T project will be at peak construction in 2001, with other construction activities happening concurrently with various projects at Logan, which if the project is approved would include construction of 14/32 and construction of the centerfield taxiway. Cumulative truck traffic, even if diverted from local streets, impacts the adjoining residential street network. CA/T and Logan road construction will have a significant impact on how trucks would access the Ted Williams Tunnel and Route 1A (an extremely congested roadway). Without having a better sense of the destination of all the anticipated truck traffic it becomes difficult to assess the impact to air quality from idling and increased congestion on the various roadways to and from Logan. 28.7

The plan also requires that a significant amount of material be excavated totaling 777,000 cubic yards. There is no mention of how stockpiles would be treated, what is Massport's plan to reduce fugitive dust from these materials? The DEIS/EIR does not present a comprehensive 28.8

view of the total amount of excavate generated from the total number of construction projects occurring concurrently, and does not detail the disposal plan. Also, Massport hopes to accomplish most of the major construction on the runway and the centerfield taxiway during the first quarter of 2000 and 2001. Dust control would potentially be dangerous and difficult to achieve with only the use of water. Massport should consider the use of chemical soil stabilizers during these winter months to prevent the accumulation of frozen mud and ice which can be tracked across runways and onto the surrounding roadway system.

I have serious concerns relative to night-time work and would expect that every measure would be taken to reduce noise at the source and would request the use of all appropriate noise mitigation measures, including sound curtains, as needed. It is important that penalties for violating noise levels be included in any contract for any airside improvement project. 28.9

While I am pleased to see that Massport would require a transportation management plan by contractors I am still concerned about construction workers utilizing local streets to park their personal vehicles, especially when working a late shift or weekends. There must be penalties included in any contract to address any potential violations. 28.10

Massport talks about a possible Memorandum of Understanding between impacted communities and the Port Authority to "ensure" that 14/32 is unidirectional and that protections remain in place restricting the use of the runway. An MOU is only as good as the people who craft it, and there is no guarantee that any of the original parties will still be in positions of power in the future when there will be an attempt to lift these restrictions, and there is never any long term guarantee for mitigation. 28.11

In closing, I wish to express my strongest opposition to the proposed Logan Airside Improvements Project, especially the construction of a new runway. I would urge you to reject the Draft EIR/EIS.

Thank you for the opportunity to comment on this proposal, and if I can provide any additional information please do not hesitate to contact me.

Sincerely,

ROBERT E. TRAVAGLINI
Senate Majority Whip

28.1	Regional Transportation	Regional Airports	Massport, and the administration, should begin by relocating certain existing cargo operations from Logan to Hanscom and to make infrastructure improvements to Worcester Airport that will make both air fields viable alternatives to Logan Airport. In addition, more emphasis should be placed on developing and marketing other airports in the New England area including: New Bedford, Providence, RI and Manchester, NH.	cargo operations account for only two percent of aircraft activity at Logan Airport and occur during off-peak hours, cargo operations do not contribute to delays at Logan Airport. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. They have begun the preparation of a Airside Project Draft EIS/EIR for these improvements. In addition, Massport has pursued a variety of initiatives to promote the use of other alternative regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials.

Code	Topic 1	Topic 2	Comment	Response
28.2	Noise	Runway 14/32	If runway 14/32 is supposed to be a regional solution, then why is the brunt of airport operations being borne by residents of East Boston, Winthrop, Revere, Chelsea, the South End and South Boston? Massport's "preferred alternative" instead, does not reduce noise but redistributes it temporarily and results in increased noise and operations in the long term.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
28.3	Noise	Model	Does Massport's definition of "noise impact areas" refer only to residences located within "noise contour" areas which are defined by Massport and submitted to the FAA or does this reflect residences which are actually receiving high levels of noise which can be documented by actual data? Complaints of increased noise seem to indicate many more residences being impacted than are currently subject to mitigation measures by Massport or located within a "sound contour".	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 Environmental Status and Planning Report*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. To the extent that federal regulations permit and that funding is available, the proposed soundproofing program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, but also (ii) those residences that fall within the 1998 65 dB Day-Night Sound Level contour as presented in the *Logan Airport 1998 Annual Update.* For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement soundproofing improvements. While not related to Airside Project impacts, Massport commits to begin discussions with the FAA with the goal of instituting local or national restrictions on the use of hushkitted Stage 3 aircraft at Logan Airport. Massport reports on the status of those consultations in the *Logan Airport 1999 Environmental Status and Planning Report* (previously GEIR).

Code	Topic 1	Topic 2	Comment	Response
28.4	Alternatives	Runway 14/32	Runway 14/32 does not begin to address the real problem - that Logan Airport is overextended and will not be able to handle the projected number of passengers who wish to fly to Massachusetts.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
28.5	Alternatives	Runway 14/32	Options A and B which impact the Hyatt Harborside Hotel and Boston Harbor, respectively, should not even be on the table.	Refer to Section 3.2 of the Supplemental DEIS/FEIR, which clearly states that Option C is the preferred layout for Runway 14/32.
28.6	Alternatives	Runway 14/32	Massport contends that if the new runway isn't built that Logan will "become an airport that operates primarily in a North-South configuration". This is the current, state of operations at Logan Airport, not something that will be created by an action or inaction on the part of Logan.	Logan Airport currently operated in a north-south configuration 70 percent of the time. Without Runway 14/32, it would operate in a north-south direction more than 90 percent of the time under the future scenarios.
28.7	Construction Period	Other major Projects	The DEIS/EIR discussion of cumulative impacts seems to minimize the reality of significant construction occurring in a very small area. The CA/T project will be at peak construction in 2001, with other construction activities happening concurrently with various projects at Logan, which if the project is approved would include construction of 14/32 and construction of the centerfield taxiway. Cumulative truck traffic, even if diverted from local streets, impacts the adjoining residential street network. CA/T and Logan road construction will have a significant impact on how trucks would access the Ted Williams Tunnel and Route I A (an extremely congested roadway). Without having a better sense of the destination of all the anticipated truck traffic it becomes difficult to assess the impact to air quality from idling and increased congestion on the various roadways to and from Logan.	The cumulative construction impacts associated with the airside projects occurring simultaneously with the Central Artery/Tunnel (CA/T) construction and other projects at Logan Airport and in East Boston are not anticipated to be significant because of project coordination and mitigation programs that will reduce construction period impacts. The peak cumulative construction traffic would occur in 2003, mostly as a result of concurrent CA/T construction on the airport. Truck traffic associated with construction decreases significantly after 2003 as CA/T construction on the airport is completed. Refer to Section 7.5 of the Supplemental DEIS/FEIR for a discussion of cumulative construction impacts. A discussion of the construction phasing, truck trips, and mitigation measures to be employed during construction of the Preferred Alternative is presented in Section 6.9 of the Supplemental DEIS/FEIR.
28.8	Construction	Soils	The plan also requires that a significant amount of material be excavated totaling 777,000 cubic yards. There is no mention of how stockpiles would be treated, what is Massport's plan to reduce fugitive dust from these materials? The DEIS/EIR does not present a comprehensive view of the total amount of excavate generated from the total number of construction projects occurring concurrently, and does not detail the disposal plan. Also, Massport hopes to accomplish most of the major construction on the runway and the centerfield taxiway during the first quarter of 2000 and 2001. Dust control would potentially be dangerous and difficult to achieve with only the use of water. Massport should consider the use of chemical soil stabilizers during these winter months to prevent the accumulation of frozen mud and ice which can be tracked across runways and onto the surrounding roadway system.	The volume of soil to be excavated has been reduced as a result of the on-going removal of stockpiled CA/T soil material from Governors Island, and the findings of a subsurface investigation program that much of the existing soil material on the airport is suitable for construction and therefore does not have to be removed. Section 6.7 of the Supplemental DEIS/FEIR includes the current project amount of soils to be excavated for offsite disposal and reuse and also discusses recent soil characterization analyses and updates the Draft EIS/ EIR analysis of soil reuse alternatives. Section 7.5 of the Supplemental DEIS/FEIR outlines other construction projects occurring concurrently and Section 8.5 of the Supplemental DEIS/FEIR describes the construction phase mitigation controls to minimize fugitive dust.
28.9	Construction	Noise	I have serious concerns relative to nighttime work and would expect that every measure would be taken to reduce noise at the source and would request the use of all appropriate noise mitigation measures, including sound curtains, as needed. It is important that penalties for violating noise levels be included in any contract for any airside improvement project.	The DEP identifies two criteria against which construction noise can be judged: it cannot increase ambient levels by more than ten dB, and it cannot produce a "pure tone" condition. The analysis of nighttime construction noise levels does not show any significant impact from construction noise, since no pure tone noise is allowed to be emitted from construction equipment such as back-up alarms, as specified in Massport's construction mitigation guidelines.

Code	Topic 1	Topic 2	Comment	Response
28.10	Construction	Traffic	While I am pleased to see that Massport would require a transportation management plan by contractors I am still concerned about construction workers utilizing local streets to park their personal vehicles, especially when working a late shift or weekends. There must be penalties included in any contract to address any potential violations.	The construction contract for the Airside Project will prohibit construction parking on local streets. The selected contractor will be required to develop a transportation management plan that addresses compliance with the parking restrictions. This transportation management plan will be subject to the review and approval of Massport.
28.11	Alternatives	Runway 14/32	Massport talks about a possible Memorandum of Understanding between impacted communities and the Port Authority to "ensure" that 14/32 is unidirectional and that protections remain in place restricting the use of the runway. An MOU is only as good as the people who craft it, and there is no guarantee that any of the original parties will still be in positions of power in the future when there will be an attempt to lift these restrictions, and there is never any long term guarantee for mitigation.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
Cambridge Street, 20th Floor
Boston, MA 02202

Dear Mr. Pugsley,

I am writing in regards to the Massport's Draft Environmental Impact Report/Environmental Impact Statement as it pertains to the Logan Airside Improvements Planning Project.

Although I believe that Massport's preferred alternative is a reasonable response in dealing with Logan's congestion, I am concerned about its decision to keep its option to implement peak period pricing should that become necessary. As Massports' study shows, peak period pricing would have a particularly negative impact on unaffiliated carriers serving the Cape and Islands, since charges could increase by up to 1000% for landing and take-offs during peak-travel times. Unaffiliated carriers would be forced to raise ticket prices by up to 50% or deal with a negative profit margin, which could lead to a reduction of service or even bankruptcy. 29.1

Loss of airline service could further result in job loss, increased traffic congestion, and a crippled tourism industry for Cape Cod and the Islands. As such, peak period pricing should not be implemented.

Sincerely,

ERIC T. TURKINGTON
State Representative

Letter 29

29.1	Alternatives	Peak Period Pricing	... I am concerned about ... [Massport's] decision to keep its option to implement peak period pricing should that become necessary. As Massport's study shows, peak period pricing would have a particularly negative impact on unaffiliated carriers serving the Cape and Islands, since charges could increase by up to 1000% for landing and take-offs during peak peak-travel times. Unaffiliated carriers would be forced to raise ticket prices by up to 50% or deal with a negative profit margin, which could lead to a reduction of service or even bankruptcy. Loss of airline service could further result in job loss, increased traffic congestion, and a crippled tourism industry for Cape Cod and the Islands. As such, peak period pricing should not be implemented.	Section 4.5 of the Supplemental DEIS/FEIR provides an updated discussion of PPP at Logan Airport and an analysis of the implications of an illustrative conceptual small community exemption program. PPP was included among the Airside Project alternatives to address delays caused by over-scheduling. In the current environment, airline over-scheduling is not a significant contributor to Logan Airport delays and, therefore, PPP was not recommended for immediate implementation. In addition, PPP imposes significant costs on regional airlines and is expected to restrict access to certain markets. The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program. Previous attempts at differential landing fee programs at Logan Airport and the analysis presented in the *1993 Strategic Assessment Report* are described in Section 3.5 of the Supplemental DEIS/FEIR. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This Exemption Program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

LETTER 30

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street, 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

The State of Maine Department of Transportation (MDOT) supports Alternative 1A in the recommendations for airside improvements at Logan, but objects strongly to inclusion of Peak Period Pricing (PPP) as an alternative without adequate study of the regional impacts of that policy. While Alternative 1A specifically excludes PPP, the discussion in the second paragraph of the Operational Improvements section of page 8-11 in Volume 1, and the corresponding paragraph on page ES-32 of the Executive Summary, adds the option of implementing PPP at some point in the future. This effectively makes Alternative 1 and Alternative 1A the same. 30.1

MDOT objection is based on an inadequate evaluation of the regional implications of this option. As noted on page ES-6 of the Executive Summary, "Logan is the gateway to New England, providing a vital link to the national and international air transportation systems. The transportation services provided at Logan - both passenger and air cargo - are essential to the economic success of the entire New England region."

The selections shown in Attachment 1, excerpted from the Draft EIS, point out that PPP: 1) is untried and it's effectiveness is unknown, 2) unnecessary, 3) creates an economic burden to operators and passengers from regional markets, and 4) could potentially jeopardize the "transportation services ... essential to the economic success of the entire New England region".

Attachment 2 discusses some of the relevant sections from the National Environmental Policy Act (NEPA), the Council on Environmental Quality (CEQ) implementing regulations, and Federal Aviation Administration (FAA) Order 5050.4A, implementing NEPA and the CEQ regulations for FAA which illustrate Maine's position on the inadequacy of the EIS in addressing the impacts of PPP.

The effects of PPP on air travel throughout the New England region must be thoroughly studied before any implementation. As noted in the Draft EIS previous attempts to implement this type of policy at Logan have met with resistance and legal action from regional air carriers and general aviation users. Appropriate study and discussion among the interested parties will provide the best possible solution to access problems at Logan, with the least impact to those affected.

Sincerely,

Ronald L. Roy, Director
Office of Passenger Transportation

Attachment 1, Excerpts from the Draft EIS

PPP is untried and it's effectiveness is unknown

Vol 1, Section 3.5 – "... At present, no airport in the U.S. has imposed such a pricing system." As no foreign operations were evaluated as part of the EIS, we assume no information was available supporting PPP.

PPP is unnecessary

Vol 1, Section 3.5 -- "Current flight activity levels at Logan do not exceed airfield capacity. Airline overscheduling has not been a significant factor in Logan delays since 1993 and is not projected to be a factor in the near-term."

Vol 1, Section 4.5.1 – "Alternative 1A (all actions except PPP) produces comparable delay savings under the Low Fleet scenarios which closely resemble current conditions at Logan. A comparison of Alternatives 1 and 1A indicates that the incremental contribution of PPP under near-term, low fleet conditions is only 2 percent ... (with a higher threshold than 110 operations the projected delay reduction benefits would be even lower)"

Vol 1, Section 4.6 – "PPP is designed to reduce delays resulting from airline overscheduling which occurs when flight demand exceeds Logan's normal three-runway capacity of 115 (average over all weather conditions) to 120 (VFR) operations per hour. Current and expected near-term demand patterns at Logan do not exhibit an overscheduling condition. In this environment, PPP would produce marginal delay reduction benefits while imposing economic costs on certain regional carriers and small communities."

PPP creates an economic burden to operators and passengers from regional markets

Vol 1, Section 4.4.5 – "A peak period surcharge will primarily affect airlines that operate small aircraft."

Vol 1, Section 4.4.5.3 – "... Regional operations at Logan are expected to be less profitable under the High Fleet scenarios because of greater airline competition"

Vol 1, Section 4.4.6 – "... The impact of the peak period surcharge will fall most heavily on airlines that operate small aircraft in highly competitive markets."

Vol 1, Section 4.4.7 – " ... The Cape and Islands were selected for special analysis because of the importance of air transportation to their tourist-based economy, their seasonal pattern of service, and their reliance on Boston for connections to the national and international air transportation network. The analysis indicated that the Cape & Island markets are particularly vulnerable to PPP due to their high seasonality and associated reliance on small aircraft. These findings are likely to be equally applicable to other seasonal markets in New England"

Appendix F, Introduction and Background – "... Carriers operating large jet aircraft would generally experience an overall net reduction in Logan operating fees, while regional carriers would incur an increase in Logan operating costs."

PPP could potentially jeopardize the "transportation services ... essential to the economic success of the entire New England region".

Vol 1, Section 4.4.7 – "... For Cape Air ... PPP is projected to eliminate its entire profit margin, even under the less severe Low Fleet scenario. The loss of Cape Air services could result in the loss of all scheduled air services for a community like Provincetown, and could produce significant service reductions at other ... markets."

Attachment 1, Excerpts from the Draft EIS (Cont'd.)

Vol 1, Section 4.4.5.3 – "A carrier's decision to cancel flights in response to PPP will depend on the magnitude of profit reduction. The greater the reduction in route profitability, the more likely the carrier will respond by canceling flights."

Vol 1, Section 4.6 -- "... Even after fare increases, the net profit impact is most severe on routes operated with small aircraft, resulting in the highest percentage of forecast cancellations for this market category."

Appendix F, Summary of Findings, Cape Air – " The magnitude of profit reduction associated with the tested pricing structure could jeopardize the viability of Cape Air's Boston services and, potentially, its entire operation."

Appendix F, Summary of Findings, Commutair – "The cost of impacts for Commutair are significant. Operating costs are expected to increase by $1.1 million to $1.7 million annually ... Commutair's profits are forecast to decline by approximately $625,000 to $935,000 annually ... Commutair is forecast to cancel 2 to 13 daily peak period operations ..."

Appendix F, Introduction and Background – " ... This change in the cost structure is forecast to produce a reduction in regional carrier flights at Logan during peak periods .... In markets experiencing a significant drop in profitability carriers are projected to cancel a portion of their remaining peak period flights."

Appendix F, Characteristics of Regional Carrier Services at Boston – "The historic context demonstrates the fragile operating economics that have characterized Logan's major regional carriers in the recent past. This history also indicates a legitimate basis for concern regarding the possible impacts of PPP on the financial health of Boston's regional carriers."

Appendix G, Potential Impacts of Peak Period Pricing – "... the PPP analysis demonstrates that the air services provided ... could be particularly vulnerable to the impacts of a potential PPP program. The low off-season passenger levels in these markets present difficulties for carriers attempting to provide year-round services with larger regional aircraft. The potential impacts of PPP are especially significant to (small regional carriers), given their high degree of reliance on Boston for access to the national and international air transportation systems."

Attachment 2, Relevant Selections from NEPA. the CEQ Regulations, and FAA Order 5050.4A

NEPA, Section 101 (a) -- Congress ... declares that it is the continuing policy of the Federal Government, in cooperation with State and local governments ... to use all practicable means and measures ... to foster and promote the general welfare ... and fulfill the social, economic, and other requirements of present and future generations of Americans.

(b) In order to carry out the policy set forth in this Act, it is the continuing responsibility of the Federal Government to use all practicable means ... to achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities ...

NEPA, Section 102 – ... all agencies of the Federal Government shall –

(C) include in every recommendation or report on proposals for ... major Federal actions significantly affecting the quality of the human environment, a detailed statement by the responsible official on – (ii) any adverse environmental effects which cannot be avoided should the proposal be implemented, and (iv) the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity

(D) Any detailed statement required under subparagraph (C) ... for any major Federal action funded under a program of grants to States shall not be deemed to be legally insufficient ... if: (iv) the responsible Federal official provides early notification to, and solicits the views of, any other State ... entity of any action or any alternative thereto which may have significant impacts upon such State ... entity and, if there is any disagreement on such impacts, prepares a written assessment of such impacts an views for incorporation into such detailed statement.

CEQ, 1501.2 – Agencies shall integrate the NEPA process with other planning at the earliest possible time to insure that planning and decisions reflect environmental values, to avoid delays later in the process, and to head off potential conflicts. Each agency shall: (c) study, develop, and describe appropriate alternatives to recommended courses of action in any proposal which involves unresolved conflicts concerning alternative uses of available resources ...

FAA Order 5050.4A, Paragraph 10.a -- The environmental assessment and consultation process is to provide officials and decision makers, as well as members of the public, with an understanding of the potential environmental impacts of the proposed action.

LETTER 31

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

As directed in Massport's letter of March 4, 1999 and requested in the Joint Massport and FAA letter of February 19, 1999, I am providing the following comments and wish to inform you of our intent to play an active role in the Logan Airside Improvements "Draft EIS/EIR" in as much as it pertains to Peak Period Pricing (PPP).

As you know, the PPP issue has been addressed previously and the policy of pricing out smaller aircraft found to be discriminatory by a federal judge in a 1988 Department of Transportation Case Ruling. A second attempt, with a twist in how pricing was applied to get around the ruling, was also dropped along with last years Runway Plan for Logan Airport. Now, PPP appears again as an option in this Draft EIS/EIR. While it is not listed as the "Preferred Option", the discussion in the Operational Improvement Section in Volume I and the corresponding discussion in the Executive Summary does allow for addition of the PPP Option in the future. Also, I have to consider, as you must, that the very active and vocal local groups and politicians opposed not only to increased traffic, but the current level of operations at Logan, could easily move the selection to any of the other alternatives, all of which contain PPP as an option.

I understand the need to pay attention to the views of the residence around Logan, but PPP as an option brings along with it the same discrimination as in the past. The citizens of Northern New England still require convenient, timely and reasonably priced access to the nation's air transportation infrastructure. PPP, whatever the scheme, denies that access. Considering the EIR/EIS acknowledgment that, "Logan is the gateway to New England, providing a vital link to the national and international air transportation system," I find it ironic that PPP is still considered and listed as an option at all in this draft.

I recommend for closure in the Final EIS/EIR, that previous attempts and failures of PPP at Logan be discussed along with its discriminatory nature, and then dropped from alternative consideration in the Final EIS/EIR. In the long run, it is the most effective way to deal with PPP as an issue and would avoid further improvement delay through confrontation or follow on litigation. 31.1

Sincerely,

Gregory Maguire, Director
Rail & Aviation Division

31.1	Alternatives	Peak Period Pricing	I recommend for closure in the Final EIS/EIR, that previous attempts and failures of PPP at Logan be discussed along with its discriminatory nature, and then dropped from alternative consideration in the Final EIS/EIR. In the long run, it is the most effective way to deal with PPP as an issue and would avoid further improvement delay through confrontation or follow on litigation.	The impacts of the Program for Airfield Capacity Efficiency (PACE) are described and evaluated in Section 3.5.1 of the Supplemental DEIS/FEIR. The PPP program evaluated in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR was designed to comply with pertinent U.S.DOT and federal court precedent in the PACE proceedings and with existing federal regulations regarding airport rates and charges. Revenue neutrality was incorporated in the tested program for this reason. Massport's prior experience with the PACE landing fee structure demonstrates that changes to the existing weight-based landing fees will undergo thorough legal and regulatory review, and that the program must be carefully structured to withstand this process. This was examined in developing the illustrative program.

LETTER 32

John Silva
Manager, Environmental Program
Airports Division
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Silva:

The purpose of this letter is to provide comment on the Draft Environmental Impact Report/Statement (DEIR/S) for the Logan Airside Improvements Planning Project. The Barnstable County Commissioners represent the people on Cape Cod.

In response to environmental, economic, and other quality of life concerns, Barnstable County has adopted policies to increase year-round transportation options and reduce reliance on automobiles. The success of these policies is central to the quality of life on Cape Cod. It is also necessary for the sustainability of the Cape's tourism industry, as well as public and private efforts to broaden and diversify the regional economy and create year-round employment opportunities.

Access to Logan airport is an important element in the Cape's transportation network. Via Logan, visitors can reach the Cape without adding to the existing congestion along the southeast expressway, Route 3 or Route 6. Access to Logan is increasingly important to a growing number of businesses on the Cape which are helping to create quality employment opportunities for residents. 32.1

The safe and efficient operation of Logan is an important issue to residents of Barnstable County. The Commissioners agree that Alternative 1A., expressed by Massport as the Preferred Alternative, is a reasonable response to current and projected delay conditions at Logan and offers the greatest potential for maintaining a high level of operating efficiency. 32.2

It is our understanding that, although peak period pricing is not included in the Preferred Alternative, it is still presented as a policy for possible future use. The Barnstable County Commissioners continue to oppose peak period pricing because it would eliminate access to Logan by carriers now serving the region. Loss of air transportation would be contrary to the county's 32.3

transportation, economic development and environmental policies, and would result in significant losses of jobs and business opportunities and would cause hardship for residents who rely on frequent affordable access to Boston for business, medical care and other purposes. The loss of air travel would also force people to use their cars, thereby adding to congestion on roadways and degrading air quality.

Thank you for the opportunity to comment on the Logan DEIR/S. If you have any questions on our comments, please do not hesitate to call the County Commissioners Office (508) 375-6635.

Sincerely,

Christine Dolen

32.1	Ground Transportation	Access to Logan Airport	Access to Logan Airport is an important element in the Cape's transportation network. Via Logan, visitors can reach the Cape without adding to the existing congestion along the southeast expressway, Route 3 or Route 6. Access to Logan is increasingly important to a growing number of businesses on the Cape which are helping to create quality employment opportunities for residents.	Comment noted.
32.2	Alternatives	Preferred Alternative	The Commissioners agree that Alternative 1A ... the Preferred Alternative, is a reasonable response to current and projected delay conditions at Logan and offers the greatest potential for maintaining a high level of operating efficiency.	Comment noted.
32.3	Alternatives	Peak Period Pricing	The Barnstable County Commissioners continue to oppose peak period pricing because it would eliminate access to Logan by carriers now serving the region. Loss of air transportation would be contrary to the county's transportation, economic development and environmental policies, and would result in significant losses of jobs and business opportunities and would cause hardship for residents who rely on frequent affordable access to Boston for business, medical care and other purposes.	The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program. Previous attempts at differential landing fee programs at Logan Airport and the analysis presented in the *1993 Strategic Assessment Report* are described in Section 3.5 of the Supplemental DEIS/FEIR. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This Exemption Program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.

Dear Sirs:

The Cape Cod Commission has discussed the "Logan Airside Improvements Planning Project" draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR). We concur with the findings and conclusions in the report that Peak Period Pricing is not an appropriate strategy for reducing aircraft delay at Logan Airport. Peak Period Pricing should only be considered at airports when scheduling or capacity is the primary cause of delays. The aircraft delays at Logan Airport are usually due to wind, not airfield capacity. Therefore, any alternatives that include Peak Period Pricing should be eliminated from further consideration. 33.1

Air travel between Cape Cod and Logan Airport is a vital part of the Cape's transportation system. Peak Period Pricing, if implemented, would create a severe hardship on airlines such as Cape Air that use small aircraft. There is a strong possibility that Peak Period Pricing at Logan Airport would force Cape Air to discontinue operations. This would have a devastating impact on Cape Cod. It would further isolate towns such as Provincetown, where the only year-round alternative to a 25 minute flight to Boston is a 3 hour trip by automobile or bus. It would also increase automobile travel between Cape Cod and Boston, adding to congestion at the Bourne and Sagamore Bridges, on Route 3 and Route 6. In addition, we understand that scheduled air service to Provincetown Airport, within the Cape Cod National Seashore, is allowed by the National Park Service on the condition that continuous service be maintained. Therefore, once air service between Cape Cod and Logan Airport is lost, some of it may never be restored.

Ironically, although Cape Air stands to suffer the most from Peak Period Pricing, the airline has little impact on current and expected future operations at Logan Airport. That is because Cape Air's small aircraft are able to land on runway 15L/33R, which is too short for most other regional carriers and is under utilized.

If the analysis presented in the draft EIS/EIR is accurate, then it appears that Alternative 1A (all actions except Peak Period Pricing) could provide a benefit in terms of equitable noise distribution and relief in aircraft delay. We would support Alternative 1A if it does have these benefits. 33.2

Thank you for the opportunity to comment on this report.

Sincerely,

Herbert Olsen

34.1	Alternatives	Peak Period Pricing	The Cape Cod Commission transportation committee ...concurs with the findings and conclusions in the report that Peak Period pricing is not an appropriate strategy for reducing aircraft delay at Logan Airport. Any alternatives that include Peak Period Pricing should be eliminated from further consideration.	The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5.2 of the Supplemental DEIS/FEIR. Section 4.5.3 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program. Previous attempts at differential landing fee programs at Logan Airport and the analysis presented in the *1993 Strategic Assessment Report* are described in Section 3.5 of the Supplemental DEIS/FEIR. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This Exemption Program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.
34.2	Alternatives	Preferred Alternative	If the analysis presented in the draft EIS/EIR is accurate, then it appears that Alternative 1A (all actions except Peak Period Pricing) could provide a benefit in terms of equitable noise distribution and relief in aircraft delay. We would support Alternative 1A if it does have these benefits.	PRAS was established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations. During very high demand periods, the controllers have little or no flexibility for runway selection. Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals by redirecting many flights to overwater routes. The addition of Runway 14/32 is the single most important mechanism to achieve equitable geographic distribution of aircraft operations and noise. Runway 14/32 and all other airside improvements would reduce current and future delays and enhance safety. The sooner that these improvements are implemented, the more long-term delay benefits will be realized.

LETTER 35

April 22, 1999

The Honorable Robert Durand, Secretary
Executive Office of Environmental Affairs
MEPA Unit
100 Cambridge Street
Boston, MA 02202

Project Name: **Logan Airside Improvements Planning Project**
MEPA #: **10458 DEIR/DEIS**

Dear Secretary Durand,

The Metropolitan Area Planning Council regularly reviews proposals deemed to have regional impacts. These proposals are reviewed for compliance with MetroPlan 2000, the regional plan for the Boston metropolitan area, as well as for their impact upon the environment. The Council encourages MEPA to ensure that proposed development scenarios and mitigation plans comply with MetroPlan 2000.

As Massport is not subject to local zoning regulations, MAPC suggests MEPA assume some of the responsibility of reviewing the full context of impacts to the region, beyond those associated strictly with the site-specific environmental impacts from the proposed activities. This is specifically important given the regional nature of airports, and the regional nature of the impacts associated with the operations of such a transportation hub used by millions of people annually.

Massport has prepared two separate MEPA documents: a GEIR which has focused primarily on landside development and impacts; and the more recent DEIS/DEIR for proposed airside development plans and associated impacts. Given the enormity of the impacts associated with any operational change at a regional airport such as Logan; economic, environmental quality, transportation, and even social, such an approach was acceptable. However, as the proposed improvements have become more specific and less generalized, the integral tie between airside and landside activities must be addressed. Only by viewing the landside impacts side by side with the correlating airside modifications, can decisions regarding costs and benefits as well as appropriateness of mitigation measures be made. This analysis should be a requisite part of any following FEIR.

It is immediately apparent that Logan Airport plays a vital role in the economy of Boston, and the New England area. The volume of people, goods and services moving to and through this facility is substantial, and the efficiency of this movement is key to the success of the operations of all subsequent and associated businesses. Furthermore, the dependability and reliability of air services plays an important role in where major businesses decide to locate. Accordingly,

changes in the operations of the airport must be seen in view of these far-reaching impacts. Setting aside the issue of the new runway, MAPC has focused its comments on the regional impacts stemming from the growing use of Logan Airport and its effects on the regional transportation infrastructures.

Given the projection that passenger use will increase from 29 to 45 million within 10 years, a 55% increase, it can be assumed that the movement of these people to the airport itself is as important as the movement of the passengers and planes through the airport system. The current roadway and transit systems available to move people to and through Boston often operate at capacity under today's conditions. It is vital that this situation be addressed – by Massport, by MassHighway, and by the MBTA. There must be a regional strategy developed which is both multi-modal and multi-airport. This comprehensive strategy needs to determine how much growth is going to occur in air traffic at each airport, how much ground traffic will be generated, and how this ground traffic will be accommodated by existing roadways, transit and even parking. 35.1

The two submitted documents (GEIR and the DEIS/DEIR) present the following noteworthy facts regarding the use of the airport facilities. This information indicates that Logan Airport is responsible for consuming much of the capacity of the existing transportation infrastructure.

- Logan Airport serviced 26.5 million passengers in 1998, and anticipates demand to reach 45 million passengers by the year 2010.
- Logan Airport is almost exclusively an origin and destination airport: almost 90% of Logan passengers begin or end their trip at Logan, with only 10% of passengers connecting between flights.
- Nearly 80% of Logan's demand is drawn from the region within the Route 495 corridor.
- Auto is, and will continue to be, the predominant mode of travel between the New England regional airport service areas and Boston.
- Nearly half of the 5,000,000 regional airport passengers that drive to Logan are closer to Manchester airport, and almost 1/3 are from the Worcester Airport service area.
- Passengers that might be served from a regional airport but instead drive to Logan for air service offer the greatest potential for Logan passenger diversion.
- While the regional alternatives alone cannot eliminate airside congestion, they can alleviate the delays experienced at Logan by achieving a better distribution of the region's intercity travel demand.
- 1 out of 3 people traveling to Logan get there by public transportation.
- For every 1% increase in HOV ridership, traffic on airport roadways goes down about 1,000 cars per day.
- The anticipated level of potential air passenger diversion to other airports or other methods of transportation (including video conferencing) represents 16-19% of Logan Airport's forecast demand.

Massport may be the greatest vehicle trip generator in the Boston area. The GEIR states that Massport is developing an Airport Intermodal Transit Connector (AITC), and anticipates that ridership of public transit will double due to the proposed improvements. Any future FEIR should specify the methods which Massport will use to guarantee this. It implies a considerable level of cooperation between the agencies responsible for managing the transportation infrastructure – Massport, MassHighway, MBTA, FHWA, and Amtrak. 35.2

Massport should be commended for their efforts in developing private vendor partnerships to improve access to/from areas such as Braintree and Newton. Massport's support of alternative

fuel vehicles and transportation demand management (TDM) is also laudable. The effectiveness of these transportation alternatives should be discussed in the FEIR, as should the possibility of beginning other public transit routes. The opening of the Woburn Intermodal Transportation Center is planned to coincide with the closing of the Mishawaum Commuter Rail Station and the neighboring Logan Express facility. The FEIR should include an analysis of ridership impact due to this closure on the northwest segment of the region, since travelers on Route 128 from the east and west will have to go north on I-93 to use the new Woburn service. We are also pleased to note that Massport will expand the Logan Express services to Cape Cod and encourage Massport to examine additional locations for Express services from current and planned park and ride lots. Efforts to limit/reduce the number of vehicles travelling to/from the airport proper should not only be explained in the FEIR, but the availability of adequate funding to support these efforts should be presented as well. 35.3

The work associated with the Route 495 Initiative should be incorporated in further documents prepared to address impacts and mitigation plans for the Airport plans. According to the Massachusetts Department of Revenue, the cities and towns along the 495 corridor exhibit the greatest amount of revenues attributable to new growth in 1996, 1997, and 1998. Furthermore, these areas exhibit the highest levels of employment and population change (1990-1995), and it is anticipated that this trend will continue in the future. The economic development around this area may be sufficient to support greater changes to the Worcester Airport than currently planned. Unfortunately, there are currently only five commuter rail trips to Worcester each day. As Massport plans to gain control of the operations of the Worcester Airport, they should consider modifications which would make this airport more accessible and convenient. For example, the existing transit schedule is insufficient to support growth at the Worcester airport. Such modification may include working with MassHighway and the MBTA to improve direct access to the airport, making the airport capable of supporting jet airplanes, and even encouraging airlines to relocate to this facility. As stated in the GEIR, the success of a multi-airport transportation system is dependent on equitable distribution of services – both air and ground related. Creating such equitable services would result in diverting considerable vehicular traffic away from the central Boston area and improving the efficiency of movement throughout the area. 35.4

The Boston Convention Center and the proposed Commonwealth Flats Development Area are only two of the proposed developments occurring in South Boston. Like the I-495 corridor, this area too is bound for considerable growth – business, commercial, residential and even industrial. The FEIR should address the applicability of the proposed South Boston Piers Transitway in providing access to this area. 35.5

In summary, MAPC requests the Secretary require the proponent to address the requirements of agency analysis under Executive Order 385, and that the FEIR include a full description of the impacts on the transportation infrastructure as well as identify the measures proposed to mitigate such impacts. More specifically, the following issues should be considered:

Impact Analysis:

- An indirect access (such as from Route 1A) permit should be required from the Massachusetts Highway Department. 35.6
- Massport should conduct a regional traffic analysis: including a passenger origination study which identifies locations at the regional/local level as opposed to the New England area level; a Level Of Service (LOS) analysis comparing resulting conditions to existing background conditions as well as to a background which includes known 35.7

development projects such as the Convention Center; an intersection analysis focusing on areas such as the ramp to the tunnel and several off-ramps from I-93; and a build analysis which examines the incremental changes in traffic flow resulting from incremental phases of the airport's improvement plan.

- A draft Section 61 finding from Mass Highway should be included in the FEIR. 35.8

Mitigation Analysis:

- Massport should identify its proposed passenger demand management/reduction and/or capacity improvement plans such as differential tolls for single occupancy vehicles at the tunnels and bridge; subsidized parking rates at peripheral sites and increased parking rates at the airport; increased assistance in existing regional airport corridor expansion; and increased assistance with and access to the passenger rail in the northeast corridor. 35.9
- Massport should identify their level of commitment to aiding in the management of the regional transportation infrastructure. For example – MBTA improvements such as the urban ring and station locations in an amount corresponding to the amount committed to the artery/tunnel project; locations for proposed new park-and-flys; and relocation of car rental facilities to off-site areas with corresponding shared transit to these areas. 35.10
- The FEIR should present any discussions regarding the effect of recent bond reauthorization legislation submitted by the administration which may reduce highway project dollars for projects in the Logan expansion impact area. 35.11

Comprehensive analysis of passenger delays is clearly a role of Massport. The fact that the delay often begins far from the airport should be just as relevant to Massport, and thus justify their involvement in managing the region's transportation infrastructure.

Thank you for the opportunity to comment.

Sincerely,

David C. Soule
Executive Director

Code	Topic 1	Topic 2	Comment	Response
35.1	Regional Transportation	Regional Airports	There must be a regional strategy developed which is both multi-modal and multi-airport. This comprehensive strategy needs to determine how much growth is going to occur in air traffic at each airport, how much ground traffic will be generated, and how this ground traffic will be accommodated by existing roadways, transit and even parking.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 Environmental Status and Planning Report* (previously GEIR) and its subsequent annual updates (Environmental Data Reports).
35.2	Ground Transportation	Access to Logan Airport	The GEIR states that Massport is developing an Airport Intermodal Transit Connector (AITC), and anticipates that ridership of public transit will double due to the proposed improvements. Any future FEIR should specify the methods which Massport will use to guarantee this. It implies a considerable level of cooperation between the agencies responsible for managing the transportation infrastructure-Massport, MassHighway, MBTA, FHWA, and Amtrak.	Massport is working with the MBTA to improve transit access to Logan Airport via the Blue Line and the Airport Intermodal Transit Connector (AITC). Section 2.7 of the Supplemental DEIS/FEIR discusses the proposed MBTA improvements in transit access to Logan Airport. The *Logan Airport 1999 ESPR* (previously GEIR), reports on the status of these ground transit improvement projects.

Code	Topic 1	Topic 2	Comment	Response
35.3	Ground Transportation	Mitigation	Massport should be commended for their efforts in developing private vendor partnerships to improve access to/from areas such as Braintree and Newton. Massport's support of alternative fuel vehicles and transportation demand management (TDM) is also laudable. The effectiveness of these transportation alternatives should be discussed in the FEIR, as should the possibility of beginning other public transit routes. The opening of the Woburn Intermodal Transportation Center is planned to coincide with the closing of the Mishawum Commuter Rail Station and the neighboring Logan Express facility. The FEIR should include an analysis of ridership impact due to this closure on the northwest segment of the region, since travelers on Route 128 from the east and west will have to go north on I-93 to use thc new Woburn service. We are also pleased to note that Massport will expand the Logan Express services to Cape Cod and encourage Massport to examine additional locations for Express services from current and planned park and ride lots. Efforts to limit/reduce the number of vehicles travelling to/from the airport proper should not only be explained in the FEIR, but the availability of adequate funding to support these efforls should be presented as well.	The Logan Airside Supplemental DEIS/FEIR discusses impacts of the proposed airside improvements. Refer to the *Logan Airport 1999 ESPR* for a discussion of ground access options including the Woburn Intermodal Transportation Center and Logan Express services.
35.4	Regional Transportation	Regional Airports	As Massport plans to gain control of the operations of the Worcester Airport, they should consider modifications which would make this airport more accessible and convenient.	The MassHighway is analyzing alternative routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport. MassHighway is in the process of preparing the EIS/EIR for these highway improvements. Massport supports this project.
35.5	Ground Transportation	Access to Logan Airport	The FEIR should address the applicability of the proposed South Boston Piers Transitway in providing access to this area.	The Airside project does not result in additional demand for ground access services.
35.6	Ground Transportation	Access to Logan Airport	An indirect access (such as from Route 1A) permit should be required from the Massachusetts Highway Department.	The Airside project does not result in additional demand for ground access services.

Code	Topic 1	Topic 2	Comment	Response
35.7	Ground Transportation	Studies	Massport should conduct a regional traffic analysis; including a passenger origination study which identifies locations at the regional/ local level as opposed to the New England area level; a Level of Service (LOS) analysis comparing resulting conditions to existing background conditions as well as to a background which includes known development projects such as the Convention Center; an intersection analysis focusing on areas such as the ramp to the tunnel and several off-ramps from I-93; and a build analysis which examines the incremental changes in traffic flow resulting from incremental phases of the airport's improvement plan.	Massport, as a matter of course, has monitored and reported on the vehicle trip generating characteristics of Logan Airport in its various environmental filings including the annual GEIR/Annual Updates documents. It has also projected vehicle trip generation estimates for an annual airport activity level of 37.5 million air passengers, and has analyzed the impacts measured and projected airport-related traffic for three different study areas (on-airport, East Boston, and regional). The results of these analyses were presented in the Logan International Airport Generic Environmental Impact Report filed with MEPA in July of 1996 (EOEA #3247/5146). Since that time, Massport has monitored traffic activity levels at Logan Airport and have reported average annual daily traffic (AADT) and average annual weekday traffic (AWDT) annually. Level of service analyses have been conducted for many intersections in East Boston and Massport has worked with the community to identify potential improvements. Additionally, Airport-related trip generation estimates have been incorporated into the traffic models used by the Central Artery/Tunnel (CA/T) Project that were integral to the design of CA/T Project roadways including the I-90 extension (TWT) and the I-90/Route 1A connections in East Boston. Estimates of Logan Airport-related trip generation have also been included in the Boston Metropolitan Area regional transportation model maintained by the Central Planning Staff. Vehicle trip origins and destinations are assigned to the respective traffic zones based on town level origin and destination data collected through Massport tri-annual air passenger surveys. As a result, Logan Airport-related vehicle trips are included as part of the regional baseline and all future condition traffic analyses prepared by Central Transportation Planning Staff (CTPS) in a manner consistent with vehicle trip generation characteristics of the Boston central business district (CBD) and other distinct trip generators in the region. In addition to the comprehensive evaluation of Logan Airport-related traffic impacts presented in annual environmental filings by Massport, or other project sponsor, also prepares project-specific traffic impacts of on-airport actions that cross MEPA filing thresholds. Examples include Environmental Assessments (EAs) and Environmental Impact Reports (EIRs) for the West Garage project, the International Gateway project, the Terminal A project, Cargo Building 63, the Logan Office Center Garage, the Hilton Hotel, etc. Each of these projects assess the traffic impacts (including construction-related traffic impacts) of the proposed project and develops appropriate levels of mitigation that are included in the project's Section 61 finding. See also the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR.
35.8	Ground Transportation	Mitigation	A draft Section 61 finding from Mass Highway should be included in the FEIR.	Draft Section 61 Findings are in Section 8.7 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
35.9	Ground Transportation	Traffic	Massport should identify its proposed passenger demand management/reduction and/or capacity improvement plans such as differential tolls for single occupancy vehicles at the tunnels and bridge; subsidized parking rates at peripheral sites and increased parking rates at the airport; increased assistance with and access to the passenger rail in the northeast corridor.	Massport has in place an extensive Ground Access Management Plan, the primary goals of which are to: increase the overall efficiency of the metropolitan transportation system through interagency coordination; increase annual air passenger HOV mode share to 35.2 percent by the time annual air passengers reach 37.5 million; reduce employee reliance on commuting alone by private automobile; provide adequate long-term parking within the limits of the Logan Airport Parking Freeze; and improve management of ground access and infrastructure through technology. Key achievements in reaching those goals include: Establishment of the Logan Airport Transportation Management Association (TMA). Massport provided subsidies for TMA members on Logan Express and MBTA. TMA members ride the Rowe's Wharf Water Shuttle for free; hired professional TMA firm to operate the Logan Airport TMA. Record ridership on the Logan Express bus service (exceeded over one million passengers in 1998 and 1999) and planning for a fourth Logan Express location. Construction of the Woburn Regional Transportation Center which will include 900 new parking spaces for Logan Express (construction completed in 2000) Planning for the Airport Intermodal Transit Connector which will provide a direct link between Logan Airport and South Station/Red Line. Initiation of the Logan DART bus service between Logan Airport and South Station. Participation with the MBTA in planning for the redesigned new Airport Station to include wide escalators, flight information monitors, and other air passenger amenities. Continued the operation of free shuttle buses between Airport Station, Water Shuttle dock, and terminals. Provided a dedicated DART bus dock at South Station with direct service to the airport. Implemented Logan Direct service from the South Shore. Continued marketing and advertising of HOV services through use of 1-800-23LOGAN telephone service and other media. Continued implementation of commercial vehicle lane, Neptune Road exit ramp peak period forced turnaround, local street closures, and traffic volume restrictions at Maverick Street. Continued traffic monitoring, curbside monitoring, and traffic control improvements. Continued development effort for Advanced Traveler Information Systems and Automatic Vehicle Identification (AVI) to monitor commercial vehicle activity. Refer to the *Logan Airport 1994/95 GEIR* which includes Massport's Ground Access Management Plan.

Code	Topic 1	Topic 2	Comment	Response
35.10	Ground Transportation	Access to Logan Airport	Massport should identify their level of commitment to aiding in the management of the regional transportation infrastructure. For example- MBTA improvements such as the urban ring and station locations in an amount corresponding to the amount committed to the artery/tunnel project; locations for proposed new park-and-flys; and relocation of car rental facilities to off-site areas with corresponding shared transit to these areas.	Massport is considering consolidation of car rental facilities, which will facilitate the consolidation of the courtesy vehicles serving the rental car companies. Massport is working with the MBTA to improve transit access to Logan Airport via the Blue Line and the Airport Intermodal Transit Connector (AITC). Section 2.7 of the Supplemental DEIS/FEIR discusses the proposed MBTA improvements in transit access to Logan Airport. The *Logan Airport 1999 ESPR* (previously GEIR), reports on the status of these ground transit improvement projects. Massport is constantly striving to make Logan Airport a more efficient transportation center with less impact on surrounding communities by improving mass transit access to Logan Airport. The Airside Project makes Logan Airport more efficient and will not affect vehicle traffic, transit systems or major roadway intersections. The Supplemental DEIS/FEIR discusses all the environmental impacts from the Airside Project. The ESPR/GEIR and its Annual Updates discuss Massport's efforts to lessen Logan Airport's total environmental footprint, especially impacts from ground access.
35.11	Ground Transportation	Mitigation	The FEIR should present any discussions regarding the effect of recent bond reauthorization legislation submitted by the administration which may reduce highway project dollars for projects in the Logan expansion impact area.	The Supplemental DEIS/FEIR responds fully to the EOEA Certificate of May 7, 1999.

LETTER 36

Dear Secretary Durand:

The Massachusetts Port Authority projects that passenger traffic at Logan Airport will grow from 26 million in 1998 to as many as 45 million by 2010, an increase of roughly 73 percent.

More passenger traffic at Logan Airport will only mean more cars, trucks and shuttle buses on our congested highways and urban road system. During peak travel times, this could make traffic congestion unbearable on the Southeast Expressway and Route 1A. It will also encourage more drivers to seek alternate routes, worsening congestion on roads such as Storrow Drive.

The majority of Logan's users actually come from beyond Route 128, according to Massport's 1996 data. These people are not getting to Logan via the Blue Line. They are driving long distances for great lengths of time on congested roads. As traffic at Logan expands, road traffic congestion will grow worse, more vehicles will slow to a crawl, and suburban travelers may not be able to get to Logan on time. 36.1

Putting more traffic on our urban road system during peak travel times raises the issue of whether residents near Logan Airport will be able to navigate their own communities and whether employees will be able to travel to and from work without further delays.

Finally, the addition of more vehicles to our roads raises concerns about environmental and economic impacts of traffic congestion, from air pollution to lost time and productivity. The region is already in "serious" non-attainment of the air quality standard for ozone, according to the U.S. Environmental Protection Agency.

Massport's Environmental Impact Statement/Report addresses none of this. It is incomplete, because it avoids the landside impacts of airport growth. Airside and landside impacts are related and inseparable. I therefore respectfully request that you require the Port Authority to provide a full and complete accounting of all the landside impacts of its improvement plan before proceeding any further. To do so would only deny the people of greater Boston the answers we deserve.

Sincerely,

Thomas M. Menino

CITY OF BOSTON • MASSACHUSETTS

OFFICE OF THE MAYOR
THOMAS M. MENINO

LETTER 37

April 22, 1999

The Hon. Robert A. Durand
Secretary of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202

Dear Secretary Durand:

Please accept this letter and accompanying attachments, which represent the City of Boston's comments on the Logan Airside Improvements Planning Project, Draft Environmental Impact Statement/Report, EOEA #10458.

The City of Boston views the proposed project as a capacity enhancement plan. As the enclosed submission indicates, the expansion of Logan International Airport's capacity raises a number of serious concerns that the Massachusetts Port Authority's DEIS/R fails to address adequately.

Expanding Logan's capacity could harm Boston's environment and public health, due to: increased air pollution from additional aircraft, additional taxiway idling, as well as increased vehicles traveling to and from Logan, increased levels of noise pollution under proposed flight paths, soundproofing equipment which may reduce indoor air quality, and impacts on the quality of water in Boston Harbor. The DEIS/R fails to address these concerns adequately, if at all.

Expanding Logan's capacity will only increase traffic congestion at Logan and the routes to and from Logan. Adding another runway to this congested airport is like adding an extra lane to the Central Artery. It is not a serious long term solution to traffic problems. More traffic at Logan Airport will only mean more cars, trucks and shuttle buses on our congested highways and local roads. Traffic congestion is already nearly unbearable during peak travel times. The DEIS/R and Massport's previously submitted GEIR do not address the full landside impacts of these airside improvements, nor do they fully explore moving greater number of passengers to and from Logan via alternative modes.

The majority of Logan's users actually come from beyond Route 128. Adding another runway at Logan for more suburban traffic is a Band-Aid approach to a regional problem that requires a regional solution. Over the last decade, the Commonwealth has repeatedly rejected or ignored studies that have recommended increasing capacity elsewhere in Massachusetts, including: the

need to land bank a site for a second major airport at Fort Devens at the junction of I 495 and Route 2; the need to develop an existing Massachusetts regional airport or air base into a large regional reliever airport; the need to make better use of Massport's own Hanscom Field along Route 128; and the need to capture lost market share at regional airports in Worcester and New Bedford. The DEIS/R contains no strategy that projects diversion of traffic from Logan to any alternative airports. The City of Boston maintains that until the Commonwealth implements a serious strategy to divert traffic from Logan to alternative airports in Massachusetts, congestion at Logan will never be solved and the environmental impacts of Logan will never be relieved.

Furthermore, if the Commonwealth and the Federal Aviation Administration allow the Massachusetts Port Authority to diminish Boston's quality of life with increased air and noise pollution and weaken Boston's competitive advantage with increased traffic congestion, then economic growth in the region will occur unevenly, and the regional imbalances that have caused this problem will only grow worse over time.

As the Mayor who convened and staffed a regionalization commission to promote greater cooperation among governmental entities in greater Boston, I am proud of my consistent efforts to advance regional agendas. Many leaders in government and business recognize the need for regional cooperation, yet so few act. I trust that you will not deny greater Boston the opportunity to come together around an issue that affects so many people in so many places in so many ways. This issue is so comprehensive and complex that it begs to be examined, debated and decided in public forums on a regional level.

Finally, as the attached submission indicates, the City of Boston has a number of concerns on Massport's other plans to optimize Logan. These concerns are not adequately addressed in the DEIS/R. Missing from these plans altogether is an exploration of demand management strategies that could reduce flight delays, namely peak period pricing. As a relief strategy, peak period pricing could be implemented in far less time at far less cost to the taxpayers than a new runway.

Upon thorough review and evaluation of the DEIS/R, and for all of the reasons enumerated in the attached submission, I regret to inform you that the City of Boston finds the DEIS/R so deficient in so many respects that 1) the Massachusetts Port Authority must withdraw this document, and 2) the Commonwealth must convene a regional panel to evaluate the state of transportation in the region, develop comprehensive strategies to meet both short-term and long-term regional transportation needs, promote a greater variety of transportation options available for our citizens and our economy, and commit the Commonwealth to meet these goals in specific and feasible ways.

37.1

Sincerely,

Thomas M. Menino

EXECUTIVE SUMMARY
Logan Airside Improvements Planning Project
April 22, 1999

The City of Boston finds the Draft Environmental Statement/Report deficient and inadequate and respectfully requests that Secretary Durand of the Executive Office of Environmental Affairs and John Silva, Senior Project Manager of the Federal Aviation Administration reject the document. The document as presented does not adequately assess the environmental impacts of the proposed project or existing conditions. Further, it does not provide critical data about a surrounding regional transportation systems that can alleviate the volumes of traffic and impacts on the communities affected by Logan. The City has requested that Massport withdraw the document and that a regional planning and evaluation team be convened to assess the overall state of transportation, by all modes, airside and landside in the region. After this updated analysis is undertaken, both a short and long term transportation plan must be included in a comprehensive regional plan.

The following is a summary of issues not adequately analyzed and critical information not provided about the levels of impact:

Environment

- Air Quality

  Increase levels of VOC, CO and NOx emissions are projected as a result of anticipated growth at Logan. **37.2**

  Increase in auto and bus emissions will result from growth. **37.3**

  With the addition of the Centerfield Taxiway, there will be additional planes with idling engines adding to pollutant emissions near public beaches and residences. **37.4**

  Current Massport soot monitoring protocols are not sufficient to determine the effect on air quality. **37.5**

Current complaints about air quality, odor and soot emissions by affected residents continue and indicate current levels are not acceptable and have not been addressed. 37.6

- Noise

There will be additional noise from idling engines on the Centerfield Taxiway which will immediately impact residents of East Boston and Winthrop. 37.7

Current complaints by residents indicate that existing noise levels are not acceptable. 37.8

Massport has indicated that runway 14/32 is to be used primarily during periods of northwest winds and inclement weather. This will increase noise volumes in the flight path. 37.9

Lowering landing minimums on Runway 27 will increase noise for residents of Winthrop. Lowering landing minimums on Runways 22L and 15R will increase noise for residents of East Boston and Revere. 37.10

- **Water Quality**

Massport has not provided the Boston Conservation Commission with adequate information about its monitoring or its compliance with the Orders of Conditions to protect the harbor and the valuable remaining wetlands. 37.11

Massport is not in compliance with the National Pollution Discharge and Elimination Systems permitted outfalls at Logan. 37.12

No pollution treatment structures for the North, Porter and Maverick Outfalls, which serve 306 acres, are discussed as required. 37.13

Before its removal, alternatives to the Blast Fence that provides marginal protection from noise, fumes and blast effects from take-offs for residents must be identified and funded. 37.14

- **Public Health**

To date little or no analysis or study of the affects on public health from Logan operations has been conducted. 37.15

No analysis of federal Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations. 37.16

Transportation

- Landside Impacts of Runway 14/32

The DEIR/S does not address the link between air transportation supply and ground transportation demand. 37.17

The DEIR/S assumes that passenger traffic at Logan Airport will grow irrespective of airport capacity and resulting delay. 37.18

The DEIR/S does not present a reasoned Build vs. No-Build analysis of airport capacity with and without Runway 14/32, nor the resulting impacts on ground transportation (regional highways, local streets, transit modes). 37.19

- **Travel Demand Management**

The DEIR/S does not adequately justify some of its future projections of transit and HOV mode share. 37.20

The DEIR/S does not differentiate the various types of HOV travel, nor does it take into account the full impacts of certain types of travel that are considered HOV (e.g. taxi and drop-off trips, passengers who drive alone to park in Chelsea are considered HOV trips because they take a shuttle one mile to Logan). 37.21

The DEIR/S does not provide adequate information on Logan Transportation Management Association membership, participation, or plans for increasing participation. 37.22

The DEIR/S does not provide adequate proposals for improving utilization of the MBTA Blue Line by air passengers. 37.23

- Airside Transportation Impacts

The DEIR/S does not adequately justify construction of the Centerfield Taxiway. Adequate runway crossing opportunities and airplane queuing capacity currently exist, and the construction of the Centerfield Taxiway would result excessive aircraft idling. 37.24

Runway 14/32 would address weather-related delays, but these are only a portion of the airside delays. The DEIR/S does not provide information on the relative impact of different causes of delay: weather, mechanical, and delays originating from other airports. 37.25

The DEIR/S discounts peak period pricing because it is assumed to reduce regional air service. Massport should analyze a peak period pricing scenario, which considers a shifting of some service to other regional airports. 37.26

Regional Alternative

- There is no description of a regional plan that actually diverts traffic from Logan. 37.27
- There are no funding requests in the Transportation Bond Bill for upgrades at Worcester, Hanscom, or Fort Devens to improve infrastructure and public transit as part of a regional strategy. 37.28
- Peak pricing is not explored as a tool to divert flights in the region. 37.29

Re: Logan Airside Improvements Planning Project, Draft Environmental Impact Statement/Report, EOEA #10458

Dear Secretary Durand and Mr. Silva:

The City of Boston has reviewed the Draft Environmental Impact Statement/Report (DEIS/R) for the above referenced project and hereby submits the following comments. The City of Boston's Environment Department, the Boston Transportation Department (BTD) and the Boston Public Health Commission (BPHC) have reviewed the DEIS/R and the City offers the following response to the DEIS/R. Attached and incorporated herein are detailed comment letters from the Boston Public Health Commission and the Boston Redevelopment Authority (BRA).

The City of Boston views the proposed project as a capacity enhancement plan. The capacity issue at Logan International Airport (Logan) is only one part of a New England transportation system that must be addressed on a regional, inter- and multi-modal level. 37.30

The City of Boston finds the DEIS/R deficient in many respects and respectfully requests that:

1. Massport withdraw this document;
2. A regional panel of experts be convened to immediately assess the overall state of transportation in the region; 37.31
3. This panel develop strategies for both short- and long-term regional transportation needs and identify a variety of transportation options available for the traveling public and the movement of goods; and,

4. Communities in the region be fairly and adequately represented on such a panel along with public officials, economists, land use planners, and representatives of environmental and public health interests.

ENVIRONMENTAL CONSEQUENCES

Air Quality

Massport's 1996 Generic Environmental Impact Report (GEIR) indicates that while emissions of VOC and CO have decreased (as has NOx to a much lesser extent), these emissions are expected to increase in the future. This is a critical issues with Stage 3 aircraft emitting significant amounts of NOx and with the projected increase in aircraft operations over time. Massport is to be commended for its program to convert its ground service vehicle fleet to alternative-fueled vehicles. Similar efforts by tenants must be strongly promoted by Massport. The City has suggested in prior comments on Massport MEPA filings that important steps in mitigating the air quality impacts of Logan may include lease agreements with new or renewing tenants that contain requirements or incentives, such as reduced curb fees for private fleet operators, for use of low or no emission vehicles by tenants.* In addition, the City believes that additional measures are necessary and requests that Massport and a regional transportation task force investigate other available technologies, particularly from companies based in the region, for reducing air emissions. 37.32 37.33 37.34

For several years, Massport has indicated that it is evaluating the benefits of moving bus servicing and other operations to off-airport locations. This will add vehicle trips to current levels, a detriment to air quality. The City has twice requested that a detailed analysis and discussion be presented in a GEIR or Annual Update (AU) but Massport has never responded to this inquiry. 37.35

Massport has stated in prior environmental review documents that $PM_{2.5}$ data for aircraft are not currently available. This is surprising since aircraft engines have undergone emissions testing for many years. This should be a subject evaluated in scientific and technical detail by the regional panel of experts. Findings and recommendations on this issue should be a component of a regional transportation report. 37.36

*References to "previous comments" refer to written comment letters submitted to MEPA and other government entities regarding Massport GEIRs, Annual Updates and project-related environmental filings.

Massport cites in the DEIS/R two soot studies released in 1997 showing that deposition of particulates in surrounding neighborhoods was not the result of aircraft operations. At that time, the Boston Air Pollution Control Commission (APCC) raised several questions as to the reliability of those studies. In particular, the APCC questioned the use of "wipe" samples from jet engine housings as representative of actual particles generated by engine operation during take-off. It is reasonable to question whether the soot adhering to the engine cowling of a single Boeing 737 might not be physically and chemically different than a particle ejected from the engine during take-off. During take-off, when the engine is running at higher RPMs, the combustion process may produce different size particles with different hydrocarbon make-up than the particles that have condensed on or adhered to the side of the engine (presumably during taxiing or idling at the gate) and exposed to prolonged periods of high temperature.

Given the continued reporting of anecdotal evidence of soot deposition and the open issues as to the accuracy and robustness of the soot monitoring protocol, the City of Boston respectfully submits that this matter demands further study. Coupled with the continuing problem of odor from aircraft operations, the overall emissions from all airside operations should be the subject of a truly comprehensive, state-of-the-art monitoring and modeling study. Critical components of this study should include: 37.37

1. Compilation of a database on emission factors for aircraft engines typically found at Logan;
2. Detailed modeling for NOx, PM_{10}, $PM_{2.5}$, and VOCs based on emissions factors and number of operations/elapsed time of operations for each type of engine. The model should include both worst-case and averages based on meteorological data for the past 5 years; and,
3. A particulate deposition study using data from actual jet engine test cell sampling to provide more accurate particle speciation of soot collected from the surrounding neighborhoods.

The methodology for this study should be subject to public and peer review prior to implementation.

The proposed Runway 14/32, at a minimum, facilitates more aircraft operations per hour during certain weather conditions. This is especially of concern when 14/32 is used for departures (wind out of the southeast) and emissions from take-off are blown back into the neighborhood. The result is that the Jeffries Point neighborhood and surrounding areas may experience an increase in concentration of jet emissions during southeast wind conditions. Moreover, 14/32 is part of Logan Airport's overall program to increase passengers levels to a minimum of 37.5 million in 2010 and, as such, contributes to the increase in emissions generated by the new aircraft operations. For these reasons alone, the Secretary should find the air quality analysis in this DEIS/R inadequate and order a re-filing of a DEIS/R including a full air quality analysis based on data from the studies outlined above. 37.38 37.39

Noise

The City respectfully disagrees with the statement in the DEIS/R that the Centerfield Taxiway will reduce noise impacts from taxiing aircraft in the areas located north/northeast of the airport. 37.40

In our analysis, the Centerfield Taxiway will allow an increased number of aircraft to queue on the airport's taxiways with their engines running. A close inspection of Massport's Airport Layout Plan (ALP) clearly notes that the Bayswater Street neighborhood of East Boston is only about 1,500 feet from Taxiway November as it runs from Runways 22L and 22R. Residents living in the Orient Logan

Heights section of East Boston between the Winthrop and Scarpa Bridges experience daily the consequences of lengthy aircraft idling. This is especially notable during the warm summer weather when 22L and 22R are used simultaneously for large aircraft operations.

It is during the summer season that air and noise impacts are most severe for East Boston residents. The existing aggregation of departures and arrivals on 22R/L and taxi events on November Taxiway cause a great deal of discomfort for those who live in Orient Heights. The Centerfield Taxiway will increase these numbers, adversely impacting residents and beach users. The low frequency noise associated with departures and high frequency noise associated with arrivals and taxiing aircraft also substantially increase the irritation experienced by residents and beach-goers.

Other Boston neighborhoods will also experience elevated noise levels as a result of the proposed plan. The projected increase in take-offs from Runway 27 will affect, at a minimum, the Seaport, South Boston, the South End, Roxbury, the Fenway, Jamaica Plain, Roslindale, Mattapan, West Roxbury and Hyde Park. Charlestown will also experience substantial increases in aircraft-related noise.

Blast Fence

The Blast Fence at the Runway 22R/22L end of Logan, directly across from the Orient Heights Yacht Club and Bayswater Street, is briefly mentioned in the DEIS/R. The issue of this fence and the absence of related community process is another example of how the needs of East Boston residents are devalued. Further, it serves as an illustration of the conflicting interests faced by airport and federal decision-makers as demand at Logan increases. 37.41

East Boston residents view the blast fence as a device that partially mitigates fumes, noise and blast effects from takeoffs on Runway 22R. Massport believes that is has an obligation to take the fence down because it frangible, and would therefore present a hazard to flight personnel and air passengers in the event of a crash. Although residents are equally concerned with airline safety, the community feels strongly that the removal of the fence will negatively affect yacht club members, recreational users of Constitution Beach and those who live in Orient Heights. The safety of air passengers, flight and ground personnel should not be accomplished at the expense of members of the public. Noise, fumes and the jet blast may present a hazard to residents, boaters and other uses of the beach. An alternatives analysis, prior to the filing of environmental documents, should include the results of a detailed investigation of a non-frangible barrier and other methods to ensure that the quality of life in and adjacent to Orient Heights is not further degraded.

Reduced Approach Minimums for Runways 15R, 22L and 27

The City does not agree with the FAA's assertion that lowering landing minimums will result in noise benefits for residents under the approach path to the runways in question. As the City understand the policy used by air traffic controllers in the Boston Tower when a pilot performs a missed approach because he/she cannot see the runway, the FAA will close that particular runway and choose a secondary runway or, in a serious weather situation, close the airport until there is an improvement. Lowering the landing minimums is likely to result in the use of these runways more often during poor the weather conditions exposing nearby residents to noise levels which they currently do not experience. 37.42

The City of Boston believes that lowering the landing minimums will only serve to expose already overburdened residents to additional noise impacts. Aircraft operations during inclement weather tend to expose nearby residents to **higher** noise levels than under normal operating conditions. The reasons for this are twofold. First, during severe weather conditions involving heavy winds and rain, a pilot must apply a greater level of thrust and adjust the aircraft's flap setting to maintain stable flight. This results in higher noise levels

and increased impacts for residents under the flight path. Second, a low cloud cover is usually present under the weather conditions that dictate the use of these lower landing minimums. When this situation occurs, noise levels from aircraft events are amplified in intensity and tend to last longer than on a clear day.

The DEIS/R indicates that the reduction of approach minimums is consistent with the minimums in effect at other major commercial airports. Current industry practice for major commercial airports allows for greater use of the four runways under certain weather conditions. However, Logan is not a typical airport. It is located in a densely populated residential area, near scarce open spaces and other sensitive receptors. This makes noise a very real problem, one that will be exacerbated by the increased thrust necessary to abort a landing at lower minimums. The City questions if the referenced "major commercial airports" are located in similar areas. When other major commercial airports are referenced in environmental review documents, the locations and characteristics of these airports should be detailed. 37.43

The approach to Runway 15R positions arriving aircraft over the heavily populated Eagle Hill section of East Boston while the approach pattern to Runway 22L results in overflights in the Orient Heights neighborhood. Lowering the landing minimums on Runways 22L and 15R will increase the noise impacts on East Boston residents. As noted in the DEIS/R (Volume I, p. 3-36), the City of Boston entered into an agreement with the FAA and Massport not to decrease the landing minimums on Runway 15R. It is our intention that this agreement should be respected and honored. The City's concerns are based on the premise that an arrival is the most difficult and challenging portion of a flight and that the poor the weather conditions that usually trigger the use of these lower landing minimums only serve to heighten the workload for pilots during this segment of a flight. With the high number of residents living alarmingly close to the touchdown point of these two runways, the lowering of the landing minimums will place these residents in additional peril. 37.44

Water Quality

Logan was constructed in wetlands at a time when the value of wetlands was neither recognized nor acknowledged. Over the years, the airport has expanded further into the wetlands and coastal resources of the City. Issues such as the regional economy and transportation have overshadowed the protection of the remaining wetlands. Although Massport has committed to protecting the bordering resource areas and complying with permit conditions, contaminants continue to enter Boston Harbor.

There are four Environmental Protection Agency (EPA) National Pollution Discharge and Elimination System (NPDES) permitted outfalls at Logan Airport: North, West, Porter and Maverick. According to the 1997 GEIR Annual Update (AU), only the North and West outfalls are equipped with advanced oil/water separator treatment systems. As described in the AU, the North Outfall "improved its compliance record for oil and grease, was in full compliance for pH, and compliance for settleable solids was slightly lower than in previous years." The West Outfall "achieved near-full compliance for oil and grease, and 100 percent compliance for pH levels and settleable solids." The Porter Street Outfall was in "complete compliance" with the NPDES permit requirements for oil and grease and pH. The Maverick Street Outfall achieved "full compliance" for oil and grease and "near-full compliance" for pH. The City finds this reporting imprecise and misleading and it is apparent that discharges are not meeting the EPA's NPDES limits. 37.45

Massport's DEIS/R description of its present drainage system describes four NPDES outfalls that drain terminal areas and portions of the airfield, approximately 50 perimeter outfalls and reliance on infiltration over pervious grasslands for the main airfield. The West Outfall, with a 557 acre drainage area, employs pollution control devices, including a mechanically cleaned bar screen, oil skimmer, grinder pump, sedimentation tank and an oil/water separator. The DEIS/EIR does not identify any pollution treatment structures for the North, 37.46

Porter and Maverick Outfalls that, combined, serve a 306 acre drainage area. It is also unknown if the 50 perimeter outfalls treat pollutants and if they are monitored and maintained.

Since 1989, the Boston Conservation Commission (BCC) has issued to Massport eleven Orders of Conditions requiring protection of bordering wetland resources. These special conditions issued by the BCC relate not only to the construction periods of projects but to the perpetual operation and maintenance of new structures.

In 1994, 9,000 square feet of wetlands (salt marsh) were lost due to construction of an FAA-mandated safety ramp at the end of Runway 22L. The U.S. Army Corps of Engineers (USACOE), the Commonwealth of Massachusetts Department of Environmental Protection (DEP) and the BCC required that Massport replicate 56, 250 square feet of salt marsh on the grounds of Logan Airport in the Wood Island Marsh area of Boston Harbor. The fifth and final annual monitoring report issued for the salt marsh in 1998 states that the vegetative cover across the created marsh is at the 70% level. ***The full value of the lost wetlands is hard to establish and there are serious questions as to whether created wetlands truly replicate the full functions of a natural wetland.***

While Massport identifies its existing drainage structures, there is no information describing drainage plans for 14/32 runoff. Pervious vegetated areas and infiltration are mentioned numerous times as beneficial to reducing water quality impacts and include a statement that "the combination of overland runoff and a large number of small discharge locations tends to attenuate and disperse the de-icing compounds used on the airfield" (DEIS/R Volume I, p. 6-94). The proposed airside improvements will result in the conversion of 39.4 acres of vegetation to paved surface. Massport anticipates the need to use more de-icing agent with the proposed improvements. If overland dispersion is presently a method of treating these compounds, how will the loss of 39.4 acres be addressed? . How will Massport mitigate this loss of pervious area? 37.47

It is obvious when one reviews Logan AUs that Massport is experiencing difficulty in complying with the BCC Orders of Conditions and EPA NPDES permits conditions. Although the AUs note that some improvements are being made, the BCC will find it difficult to permit the creation of additional impervious surface and the construction of additional facilities that may impact Boston Harbor and bordering wetland resources. The City concludes that Logan has reached its maximum development level or may have surpassed its capacity for this parcel, bordered by fragile natural resources. 37.48

Billions of taxpayer dollars are being spent to clean and maintain Boston Harbor. Federal, State, and local environmental agencies permit and regulate facilities that discharge into the Boston Harbor Watershed. New permits or amended permits for increased size or capacity of facilities that discharge are conditional upon compliance with existing uses. The City asks that Massport review its permits, including all perpetual Orders of Conditions, and provide evidence that these conditions are being met.

Furthermore, the City asks that Massport provide documentation that these commitments are being met: 37.49

DEP File No. 6-464, March 13, 1991
Logan Landscaping Improvements Special Conditions

14. Where relevant, all facilities and equipment will be continually operated and maintained so as to comply with the conditions and the Act. Maintenance conditions are ongoing and do not expire at the end of one year or with the issuance of the Certificate of Compliance. The applicant, owner successor or assignees shall be responsible for maintaining all on-site drainage structures and outfalls, assuring the lasting integrity of the surface cover on the site

and site activities so as to prevent erosion, siltation, sedimentation, chemical contamination or other detrimental impact to the on-site and/or off-site resources areas.
19. All surface drains on the project site must have a legible stencil painting within one foot of the structure indicating that the drain drains to the Boston Harbor.

DEP File No. 6-467, June19, 1991
Massport Employee Parking and Associated Roadway Special Conditions

37.50

16. Where relevant, all facilities and equipment will be continually operated and maintained so as to comply with the conditions and the Act. Maintenance conditions are ongoing and do not expire at the end of one year or with the issuance of the Certificate of Compliance. The applicant, owner successor or assignees shall be responsible for maintaining all on-site drainage structures and outfalls, assuring the lasting integrity of the surface cover on the site and site activities so as to prevent erosion, siltation, sedimentation, chemical contamination or other detrimental impact to the on-site and/or off-site resources areas
18. Signage on the site shall indicate that the drainage drains to the Boston Harbor.
20. All catch basins and other drainage structures shall be cleaned and maintained regularly. A plan and schedule shall be submitted to the Boston Conservation Commission prior to the issuance of a certificate of Compliance. This maintenance condition shall continue in perpetuity.

DEP File No. 6-516, July 22, 1992
Massport Test Borings/Logan

37.51

16. During and after work on this project, there shall be no discharge or spillage of fuel, oil or other pollutant into any area of statutory interest. The proponent shall have an emergency spill management plan prior to work start up, a copy shall be sent to the Conservation Commission.

DEP File No. 6-544, May12, 1993
Logan Safety Ends

37.52

14. Where relevant, all facilities and equipment will be continually operated and maintained so as to comply with the conditions and the Act. Maintenance conditions are ongoing and do not expire at the end of one year or with the issuance of the Certificate of Compliance. The applicant, owner successor or assignees shall be responsible for maintaining all on-site drainage structures and outfalls, assuring the lasting integrity of the surface cover on the site and site activities so as to prevent erosion, siltation, sedimentation, chemical contamination or other detrimental impact to the on-site and/or off-site resources areas
34. All newly constructed or relocated catch basins for runoff from the perimeter access road or other paved surfaces shall include oil/water separators to meet the needs of appropriate control of the paved drainage area. Enclosed are BWCS oil/water separator standards.

Wildlife Habitat

Massport minimizes the importance of wildlife habitat areas at Logan Airport claiming that the urban environment hampers the establishment and/or viability of any natural habitat. The City accepts that the wildlife, a variety of birds and mammals, take second place to the functioning of the airport. At the same time, the Boston Conservation Commission serves to protect and enhance the City's natural resources. The established habitat, including the presence of the upland sandpiper (a state-listed endangered species) is proof

that there is a viable habitat at the airport and that Logan is not and cannot be segregated from the Boston Harbor and Belle Isle Marsh ecosystems. 37.53

The DEIS/R Conservation and Management Plan has three sections:

- alteration of existing airfield grassland mowing procedures to encourage the uses of non-construction areas;
- implementation of a pre-construction and an on-going pre-mowing upland sandpiper reconnaissance program; and,
- off-site mitigation.

The City strongly objects to the suggestion that off-site mitigation should occur outside of the Boston Harbor area.

Public Health

The Boston Public Health Commission (BPHC), believes that Massport, the FAA and the U. S. Department of Transportation (DOT) have failed to take the health of Boston residents into consideration in planning the proposed project. This is of particular concern because of the potential impact on some of the City's most vulnerable populations, disproportionately affected by negative environmental factors. In addition, the failure to consider such matters appears to be out of compliance with federal Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations." This Order requires every federal agency to identify and address the environmental and health effects of its programs that particularly burden minority and low-income communities. The City asks that the FAA and DOT comply with this Order and provide documentation and all relevant data to that effect. Additional detail is provided in the attached letter from the BPHC. 37.54 37.55

The City notes that Massport was a contributor to a South Boston air quality study conducted by the Harvard School of Public Health on behalf of the South Boston Community Health Center. The study gathered important information on various sources of air contaminants including apportioning sources of PM_{10} and $PM_{2.5}$. There would be considerable value in gathering such information and monitoring particulate matter levels in other Boston neighborhoods impacted by Logan. This information will allow public health officials to build on the information gathered thus far.

TRANSPORTATION

Ground Transportation

Massport has consistently framed projects based upon a premise that landside and airside issues are independent of each other. The City of Boston has long maintained that the two are inextricably linked. 37.56

The City of Boston requests that the Secretary find this DEIS/R inadequate on the grounds that there is no analysis of the landside transportation impacts of the proposed Runway 14/32. The DEIS/R's reliance on analysis included in the GEIR is unacceptable, since the GEIR does not include specific impacts related to Runway 14/32. In addition, the City finds that many of the GEIR's assumptions related to HOV and transit modes are questionable, and that these assumptions should be re-examined.

The DEIS/R's neglect of landside transportation issues is based on the premise that Runway 14/32 will not add capacity, only relieve delay. The City strongly questions the premise that passenger demand at Logan Airport is inelastic with respect to delay. The DEIS/R states that passenger demand will grow from approximately 25 million per year to 37.5 to 45 million per year, irrespective of the levels of delay, whether or not Runway 14/32 is built. Under this assumption, the only impact is on delay, which more than quadruples from an estimated 37.57

143,000 hours in 1998 to 596,000 hours in 2010 with no new runway. It is illogical to suggest that such an increase in delay would not result in a shift in air service to New England's other airports or other services to substitute for air travel to and from Logan Airport. Such a shift in activity would result in divergent Build and No-Build conditions.

This demands that Massport analyze the difference between the Build and No-Build conditions, for both airside and landside impacts. Massport should be required to examine runway operational capacity, landside trips by mode, impact on roadway and transit capacity, and unfulfilled passenger and cargo demand that could be accommodated at other regional airports and transportation facilities. 37.58

Further, the GEIR's traffic analysis sections have consistently been fraught with unsupported assumptions and questionable methodologies. For instance, in calculating high-occupancy vehicle trips (HOVs), Massport includes employees who come in by shuttle bus from the 1,550-car parking garage in Chelsea and from parking facilities in Revere. Most employees have driven in single occupant vehicles (SOVs) to these facilities and ride in an HOV for about one mile to the airport. It is specious to suggest that a one mile ride in a shuttle van or bus from a parking lot to the airport constitutes HOV commuting. Such a perspective could conceivably allow for reports of increased employee HOV use while the 7,100 on-airport employee spaces and a substantial increase in employee parking in areas surrounding the airport would allow for ample, unconstrained SOV commuting. 37.59

According to the 1997 GEIR Annual Update, 1997 scheduled and non-scheduled air passenger HOV ridership increased by 6.8% and 7.0% respectively over 1996 levels. While the City is pleased to see HOV increases, the question remains how single party transportation by an unscheduled commercial provider is considered an HOV service. A means of transit should not be considered high occupancy unless there are three or more air passengers in the vehicle for the majority of the trip. A private, on-demand service that transports one passenger to Logan is not an HOV, but functions as does a taxi.

Again, future air passenger surveys, information asked of registered providers and Transportation Services Unit statistics should distinguish between the use of vehicles containing less than three air passengers and those containing three or more air passengers (true HOVs). Current and projected mode share statistics should then be modified as necessary to reflect the difference. A distinction must also be made between carpoolers and drop-off/pick-ups. The Boston Transportation Department (BTD) suggests that Massport re-think traffic impact analysis in terms of vehicle-miles traveled and passengers per vehicle trip.

Massport appears to rely on additional passenger and employee parking facilities just outside the East Boston parking freeze area to get employees and passengers within shuttle range of the airport. This puts an increased burden on private sector carriers and nearby communities to accommodate potentially dramatic increases in vehicle trips. This would certainly seem to work against the goals of the Transportation Management Association (TMA). 37.60

The 1997 Annual Update indicates that TMA membership is now 20% of all airport employees and that one TMA member is offering subsidized MBTA passes. No information is provided about the number of employees who belong to the TMA or who receive an MBTA pass subsidy. No explanation is offered for the TMA estimate that a reduction of only 250 to 300 employee commuter vehicle trips may result from Transportation Demand Management (TDM) measures. With 15,000 individuals employed at Logan, this trip reduction estimate is particularly questionable. 37.61

Completion of the MBTA's Blue Line Modernization Program is described as a project that, in conjunction with the Airport Intermodal Transit Connector (AITC) and other transit projects will help increase the number of airport passengers using transit. Although the MBTA has not announced a final project schedule for the Blue Line project, it has been progressing at a slower than anticipated pace. This situation must be taken into account in assessing the impacts of increased operations and passenger levels. 37.62

Centerfield Taxiway

The DEIS/R claims the Centerfield Taxiway will reduce taxi delay for 4R arrivals trying to cross 4L at the 33R/4L intersection, permitting simultaneous crossings of 4L at multiple points and moving activity away from communities. There are currently three (3) access points available to cross Runway 4L for arrival traffic on Runway 4R enroute to the terminal area: 37.63

- the high speed turn-off Taxiway R to Taxiway N;
- the high speed turn-off Taxiway Y to Runway; and,
- for smaller jets and commuter aircraft, Runway 33L to Taxiway Q.

It is not clear why three (3) crossing points to Runway 4L are insufficient to handle most, if not all, capacity situations. Based on Massport's assertion that three crossing points are in adequate, specific information is lacking to substantiate the claim, such as:

- the number of crossing points for Runway 22R/4L that Massport believes and the FAA requires to reduce taxiing delays for Runway 4R arrivals;
- a description of scenarios under which there would there be more than three (3) aircraft on various taxiways waiting to cross Runway 4L with Runway 4R in use for arrivals; and,
- a description of the delay benefits to an aircraft landing on Runway 4R, and holding short of Runway 4L under current conditions, in comparison to an aircraft landing on 4R and using the Centerfield Taxiway to seek an additional point to cross 4L.

The Runway 4R scenario fails to justify the benefits of the Centerfield Taxiway. The City disagrees on the issue of simultaneous crossings of Runway 4L at multiple points. Additionally, Massport's claim that the Centerfield Taxiway will move this type of activity away from the community lacks merit. While it may move aircraft taxiing to the terminal area further from the Harborview section of East Boston, it would move taxiing aircraft closer to both the Bayswater section of East Boston and the town of Winthrop. Even if the Centerfield Taxiway is constructed, a pilot must still hold short of Runway 4L prior to crossing, regardless of the point of approach, until he or she receives FAA ground control clearance.

While the Centerfield Taxiway would provide an additional taxiing route to both Runways 22L and 22R, the City believes that the delay benefits may be exaggerated. The issue of Runway 22L departures is overstated as demand for departures on this runway is minimal. Further, the City question the delay benefits of a Centerfield Taxiway. During peak periods, the current number of aircraft on Taxiway November, approximately 3,800 feet in length, enroute to Runways 22R/L for departure, usually totals 10 to fifteen. The Centerfield Taxiway will be 9,300 feet in length. Since both the FAA and Massport will not agree to limit the number of aircraft allowed to queue on the Centerfield Taxiway, this will result in the potential for FAA ground controllers to approve permission for 40 to 50 aircraft to taxi to either Runway 22R or 22L. The City finds it difficult to comprehend how any aircraft located in the rear of this enormous queue would depart any earlier than if the pilot 37.64

was waiting at a gate with the plane's engines off. *Delays would remain*, with the only difference being in the location of the aircraft at the airport. Furthermore, additional information and clarification are necessary on the environmental benefits, both from a noise and air quality perspective. It is difficult to comprehend how environmental improvement can occur when there will be a dramatic increase in the number of aircraft on the airfield with engines running. The great majority of these aircraft will operate much closer than they do now to both the Bayswater Street and Court Road neighborhoods. 37.65

The City of Boston believes that possible delays on Echo Taxiway from arrivals on Runway 22L also fail to justify the construction of the Centerfield Taxiway. Massport claims the Centerfield Taxiway would allow simultaneous crossings of Runway 22R at multiple points. This issue must be clarified as the City understands that multiple crossings of 22R currently exist at Taxiways Echo, Charlie and Sierra for large jet aircraft and Taxiways Echo, Charlie, Sierra, Fox Trot and Quebec (via Runway 33L) for smaller aircraft. How many crossing points are required in order for the air traffic controller to have a safe and efficient set of options? Also, what are the environmental benefits related to the Centerfield Taxiway if a pilot enters the Centerfield Taxiway and heads back towards the community seeking a place to cross Runway 22R? 37.66

Although there may be times when an aircraft taxiing on the Inner Taxiway (Alpha) is required to hold short for an aircraft push-back, this event should only occur at Terminal C, Gates 29, 30, 32 and 34. Any delays that occur in this small area are infrequent and do not necessitate the construction of a 9,300 foot taxiway. Also, Massport has listed as one of its criteria for the construction of the Centerfield Taxiway the concern about wing-tip clearance conflicts on Taxiways Alpha (Inner) and Kilo (Outer). Should the Inner Taxiway remain in service subsequent to the construction of the Centerfield Taxiway, what is to prevent this potential conflict from remaining a concern? 37.67

Massport claims the Centerfield Taxiway will enhance the general safety of airside operations and facilitate more efficient movement of aircraft between terminal areas and runways during takeoff and landing procedures. While it may facilitate aircraft movements on the airport surface, the City questions how it would enhance the general safety of airside operations, since the dramatic increase in the number of simultaneous aircraft ground movements could increase the potential for ground incursions on Logan's complex taxiway system. 37.68

The location of the Centerfield Taxiway will be between Runways 22R and 22L, separated from the runways by 1,500 feet. Taking into consideration its length (9,300 feet) and the proposed location, a pilot not familiar with the airport may experience an identification problem while on approach to either 22L or, for small aircraft, 22R. Although surface lighting differentiates taxiways and runways, there exists the potential for a pilot to land his or her aircraft on the wrong runway or on the taxiway itself. While this may not be a daily difficulty, it has transpired at Logan without the existence of the taxiway between the runways. As evidence is the event that occurred on July 12, 1987, when a jet transport landed on Runway 22R rather than 22L as assigned. 37.69

The November Taxiway will remain in operation. Therefore, the City would like to request clarification on how the air quality and noise benefits will be achieved? In our opinion, it appears that 37.70

November Taxiway will continue to impact the East Boston Yacht Club, Constitution Beach and the western portion of Bayswater Street, while the Centerfield Taxiway will place taxiing aircraft closer the Court Road section of Winthrop and to the center of the Orient Heights / Bayswater Street Neighborhood.

The DEIS/R also claims that the Centerfield Taxiway will reduce delays for aircraft enroute to Runways 22R/L for departure. Although this could occur if a minimal number of aircraft on the field, the City questions how this benefit would be accomplished during peak periods of operation, when the number of aircraft movements on the airfield increases substantially? Construction of the Centerfield Taxiway could literally allow more than double the number of aircraft ground movements occurring simultaneously on Logan's taxiway and runway network, than currently possible. Although there would be two routes for aircraft enroute to Runways 22R/L for departure, all the City can deduce from this scenario is the more than doubling of the current level of delays and the associated increase related to both noise and air quality impacts. 37.71

If the motivation behind this taxiway is to open gate space by increasing queues on taxiways, allowing Massport to reduce the so-called "delays" occurring now, then this plan is clearly a capacity enhancement program for Logan. 37.72

Delay

The City questions Massport's representations of delays. Massport asserts in the DEIS/R that delays at Logan are primarily caused by the drop in airfield capacity that results from wind and the weather conditions forcing use of a two runway configuration. However, there is no hard data provided to sustain this conclusion and the DEIS/R discussion fails to comply with the Certificate issued by the Secretary in 1995 on the ENF. Missing from any discussion or evaluation of delay is the role of other airports in delaying flights destined for Logan and problems with equipment or personnel, both at Logan and other airports. Airlines with older fleets may be particularly subject to mechanical difficulties and other delay-prone airports likely contribute to the identified problem at Logan. Delays due to cargo and small commercial and private aircraft must be a significant factor in delay. This suggests to us that delay must be evaluated in a regional context as these are the types of flights most easily accommodated at other airports. 37.73

Future air passenger surveys should include questions about the passenger's origin and the timeliness of the flight(s) leaving the city of origin or that they traveled on prior to reaching Logan.

Peak Period Pricing

Massport's recommended project alternative does not include peak period pricing. Such a program would raise the price of using Logan during hours where the level of demand exceeds available runway capacity.

In its analysis of this administrative option, Massport assumes that some existing aircraft operations would be discontinued by a shift to off-peak hours or cancellation of the service altogether. A scenario in which airlines would move service to a regional airport is not mentioned, as if it were not a viable option. Also neglected is a plan in which airlines would continue to offer flights at peak times but 37.74

would add a surcharge to the fare to make up for the peak assessment. In short, peak period pricing need not result in reduced regional air service. Massport's rejection of this alternative is unsupported by the arguments outlined in the DEIS/R. What is clear is that diversion of service to regional airports, not owned by Massport, will hurt Massport's bottom line.

Finally, Massport considered a revenue neutral peak period fee structure in 1992 and decided to publicly examine that option as part of an overall airside improvements plan. This represents the loss of six years in which such a program might have helped regional airports attract service.

REGIONAL ALTERNATIVES

The DEIS/R asserts that Massport's overall planning strategy for managing congestion and improving Logan's operational efficiency includes the use of regional air, rail and videoconferencing (telecommunications) alternatives. Ensuring the efficient use of the region's transportation infrastructure is described as the collaborative function of a range of transportation entities including the FAA, Massachusetts Aeronautics Commission, New England State Aviation Directors and regional airports. Participation in long-term regional planning studies is also identified as part of Massport's long-standing recognition of the importance of discussions on intermodal, regional transportation projects.

Background

The City of Boston sees the proposed Runway 14/32 as a stop-gap approach to a truly regional transportation problem. The most serious delays at Logan are caused by a lack of appealing alternative airports in greater Boston for airlines and consumers. Without attractive options, traffic to Logan will continue to increase. The City of Boston cannot absorb additional growth in capacity.

According to Massport's own documentation, the opportunities for Logan's growth are limited. Massport's Director of Aviation stated that "Ultimately, there will be a ceiling that will be hit" (Boston Globe, June 19, 1994). As far back as four years ago, Massport staff noted that "Logan can't continue to handle it anymore" (Boston Globe, November 28, 1995). An FAA-funded report further stated that "regardless of the author or methodology, everyone agrees that Logan will soon be unable to meet demand" (New England Regional Air Passenger Service Study, Executive Summary, 1995).

The DEIS/R states that the majority of Logan's users come from beyond Route 128. This indicates that growth is occurring at the metropolitan edge while Logan remains greater Boston's only major airport. As more travelers fight traffic on urban roadways to get to Logan, the people who live and work beyond Route 128 will be unable to get to Logan on time. In the final analysis, attracting more passenger traffic to Logan will only aggravate delays. According to a 1995 Boston Globe report, this fact has been recognized by Massport officials. In a December 24, 1995 article, an official stated that a new runway at Logan "won't ease the congestion that now ranks Boston as the nation's fifth worst city for flight delays. This record undoubtedly will get worse,...if Logan's passenger traffic grows as expected, from 25 million people this year to a projected 45 million in 2010." The Strategic Assessment Report (SAR), conducted in 1993 for the Massachusetts Aeronautics Commission (MAC) by Arthur D. Little, Inc., agreed: "Simply improving the capacity of Logan will not solve the transportation capacity problem" in the region (SAR, Volume 1, ES-6).

The FAA's Airports Division of the New England Region determined that decentralizing airport usage patterns is critical to meet the region's future high speed transportation needs (Issues in Developing a New England Service Plan, April 28, 1994). Massport's planners voiced the same conclusion. "Diverting travelers from Logan, they say, is about the only way that they can see to relieve growing congestion and delays in Boston"

(Boston Globe, December 24, 1995). Any further concentration of traffic at Logan Airport contradicts these policy statements.

Table 4-8 in the 1996 Annual Update (AU) to Massport's Generic Environmental Impact Report (GEIR), contained a list of Regional Planning Studies and the implications of those studies for Logan. The City found that the information Massport chose to highlight from two of the cited studies, the SAR and the Second Major Airport Siting Study (SMA), did not fully represent the conclusions of those studies as they would affect Logan. The same is true for the way in which Massport now portrays the motivations for and conclusions of these studies in public Airside Improvements presentations. 37.75

The SMA study was undertaken because the 1989 Massachusetts Airport System Plan (MASP) concluded that even with operational and capacity improvements at Logan there would be a need for a second major airport by 2010. The SMA study did not contain a specific recommendation about the type of airport necessary (international, short-haul or long-haul domestic). The SMA study recommended that the state land bank a suitable site for a potential second major airport, most preferably at the decommissioned Ft. Devens in Ayer, near the junction of Interstate 495 and Route 2. This policy recommendation was eventually discarded by the Weld administration.

After the Weld administration decided against pursuing plans for a second major airport in the region, the Strategic Assessment Report (SAR) was conducted and rested upon baseline assumptions that were different from the 1989 MASP and 1990 SMA study. The primary differences were in demand forecasting for Logan and in the potential effects of telecommunications and new travel technologies on passenger numbers. Significant reductions in air travel demand were forecast due to projected growth in telecommunications (including videoconferencing), vertical take-off and landing (VTOL), magnetic levitation (maglev) and high speed rail. While high speed rail will be a reality along the Northeast Corridor this year, the cost of service may not provide a sufficient incentive for a change from air travel. The effect of the other technologies on transportation demand is not well understood or documented and the City believes that passenger diversion conclusions were vastly overstated. For example, the SAR claimed that telecommunications could divert up to 10 million passengers from air travel by the year 2010. Stephen P. Tocco, when Executive Director of Massport, noted in November 5, 1993 comments on the SAR that Massport did not believe that "teleconferencing and other telecomm technologies will have the impact of easing demand for travel services by 2.5 million in 2010 and 7.2 million passengers in 2030" (SAR, Vol. III, p. B-4).

While telecommunications may play a role (as yet undetermined in scope) in changing business air travel, it will have no impact on pleasure travel. The potential for widespread use of VTOL is unknown and issues such as noise, safety, terminal locations and ground access are unaddressed. Maglev technology has not yet been tested in commercial use in the U.S. and the City is aware of no plans for such testing.

It was determined through data evaluation for the SAR that, "The demand forecast identified the potential need for a facility smaller than the originally envisioned SMA, but larger than that offered by current or potential regional airports" (SAR, 2-11). This report considered the option of a "large regional reliever airport" (LRRA) instead (SAR, ES-7). It urged the state to "reconsider expanded use of one of the air bases or the existing regional airports not as a regional airport, but as a regional reliever airport, with special consideration given to Hanscom Field due to its proximity to the demand" (SAR, ES-5).

According to the SAR, "based on location alone, the Hanscom Field site was more attractive to travelers than the SMA and any other non-Logan site." The report said that initially Hanscom could accommodate 720,000 passengers a year and ultimately take 4.1 million passengers a year away from Logan, compared to an

estimated 3.95 million passengers that could be served at a new second major airport at Ft. Devens (SAR, 3-94 and 5-16). Use of Hanscom as a reliever airport "provides the largest diversion from Logan of any scenario in this study" and "would appear to have a very beneficial effect on the noise and surface traffic impacts on the communities surrounding Logan" (SAR, 5-86).

In addition, the SAR urged Massport to pursue options to raise Logan's "weighted average peak hour capacity" (see section entitled, "Logan International Airport Capacity Enhancement," SAR, Vol. II, p.4-12). According to the SAR, renewed interest in the long dormant Runway 14/32 proposal grew out of a "Capacity Delay Task Force." But Michael Dawson, a private aviation consultant, in a letter to Massport correcting errors in the report, claimed that the correct name for this group was actually the "Airport Capacity Enhancement Task Force." This is an important distinction, because if Runway 14/32 is in reality a capacity enhancing measure, then the rationale for the runway contradicts Massport's recent statements. It may also violate the Supreme Judicial Court injunction that prohibits the airport's expansion. 37.76

Clearly, as the recommendations of both the SAR and SMA were ignored by state officials, Logan now finds itself in a severe capacity crunch and the most obvious target for expansion. 37.77

Peak hour travel time at Logan is a limited resource. Adding another runway is like adding another lane to the Central Artery. It is not a long term solution. Until Massport and a consortium of other public entities can expand capacity at alternative airports within the region, the immediate solution for relieving delays at Logan is to ration the existing resource through demand management policies. As noted in the SAR (Volume II, p. 2-8), "Demand management could prove to be a necessary tool for managing the utilization of the existing capacity if no consensus can be reached on making improvements or additions to existing high-speed inter city transportation infrastructure." The SAR put Logan's "practical capacity" at an average of 95 operations per peak hour. "An unpublished re-assessment by the FAA's New England Region Office in 1992 placed this value at approximately 93.6" (1993 SAR, Volume II, p. 4-11).

The Proponents contend that Runway 14/32, on its own, does not generate any additional aircraft operations or increase in passengers, it merely reduces delays (see DEIS/R 7.0 at 7-3). At the same time, Massport expends considerable effort to argue that the excessive delays at Logan Airport make Boston and Massachusetts less competitive for business and tourism (DEIS/R p. 1.0). However, the proposed new Runway 14/32 will precipitate increased passenger volumes with consequent increases in vehicle-miles traveled. In the past, Massport has cloaked airside improvements under the veil of improved management of existing aircraft operations. But clearly, 14/32 is different and will facilitate a new round of added air service and increases in vehicle traffic on the roads, both locally and regionally. 37.78

Massport claimed that it can seek to remove the injunction against capacity enhancing improvements for "reliever" purposes (Wall Street Journal, April 19, 1999). If this is actually the case, the City questions why Massport has not pursued demand management policies such as peak hour pricing for relief. Unlike an additional runway or alternative airport development, such a solution could be implemented much more quickly at a much lower public cost. 37.79

Massport has indicated that delays at Logan will continue to grow over time whether or not Runway 14/32 is constructed. Constructing a new runway is only a short-term approach and will do little to solve the expanding regional transportation issues that must be addressed through a comprehensive, regional, inter/multi-modal solution. 37.80

In Section 2.5.1 of the DEIS/R (Volume I, p. 2-38), Massport claims to be "actively engaged in promoting the use of alternative travel choices to provide relief to Logan." Massport talked about relieving congestion at Logan by expanding use of the state's regional airports in Worcester and New Bedford. Yet, after years of talk and so-called plans, Worcester and New Bedford carry the lowest number of passengers of the eight New England regional airports examined in the Regional Air Service Study.

The airport in Worcester, New England's second largest city, retains only nine percent of its service area traffic. This is not much better than Manchester's airport, which retains only 25 percent (DEIS/R, p. 2-18). Together, these two airports lose 4 million passengers a year to Logan (NEC Study, paper #1, p. 2). These travelers represent almost all of the five million passengers who bypass regional airports to drive to Logan every year. And, these five million passengers who bypass regional airports make up roughly 20 percent of Logan's annual passenger traffic (DEIS/R, p. 2-19). 37.81

A Worcester airport study issued in 1995 estimated Worcester's service area demand at 2.2 million, many times more than the 160,000 annual users at the time (NEC Study, paper #1, Table 7). Massport states, "Aggressive service development at the regional airports is the key to recapture the traffic they now lose to Logan." Yet there has been no aggressive service development at Worcester, Hanscom or any other regional airport in Massachusetts, even though Massport claims that "The regional alternatives to Logan airport are an important component of Massport's plan for reducing delays at Logan" (EIS/R 2-48).

According to the New England Regional Air Passenger Service Study conducted by the New England Council in 1995 (NEC Study), the keys to making regional airports more attractive are increased air service at competitive fares and improved ground access as well as shorter drive times and less traffic congestion than the ground routes to Logan (NEC Study, paper #1, p. 6). The NEC Study also found New England's existing regional airports were "capturing less than their full potential demand" and pointed to "significant potential for increased jet service at each of the regional airports" (NEC Study, paper #3, p. 2). This study estimated Logan's total annual operations capacity at 500,000; Hanscom's at 322,000; and Worcester at 282,000.

The City reminds you that Massport's Logan revenues must remain at certain levels to maintain current infrastructure and programming and to provide a return to bondholders. As such, the promotion of other modes of travel or other airports for travel is the promotion of competition for Massport. Massport's unsuccessful record in diverting traffic to other airports makes the City doubt Massport's claim of promoting regional alternatives.

Furthermore, the City notes that the DEIS/R does not include any discussion of the diversion of cargo to off-airport alternatives and, thus, does not comply with the Secretary's Certificate on the ENF. 37.82

Although the DEIS/R states that "The regional alternatives to Logan airport are an important component of Massport's plan for reducing delays at Logan" there has been no aggressive service development at Worcester, Hanscom or any other regional airport in Massachusetts (DEIS/R, p. 2-48).

Essential to the success of distributing air traffic within the region is the development of a comprehensive, inter- and multi-modal transportation system. Such a system should address not only the diversion of passengers from air service but should ensure that travelers have convenient vehicular, private and public transit access to regional transportation hubs. Transit options may include shuttle buses, rail, subway and bus access. In order to minimize air quality impacts, incentives should be offered for the use of alternative fueled vehicles. 37.83

37.84

Logan and Worcester Airport survey figures do not distinguish between commuter, charter and other regularly scheduled non-commuter flights. Given the steady growth in small commuter flights to Logan, the City believes that such information is needed so that other airports may examine whether or not there is a commuter market to be captured for their facilities. Overall, this kind of information from regional sources is necessary for long-term planning and strategizing. The City recommends that data yielding this information be part of the evaluation or regional air transit.

Providence and Manchester airports have not diverted traffic from Logan. As for other out of state airports, Massport admits that from 1997 to 1998, "Despite strong growth at T.F. Green [near Providence] and Manchester, passenger traffic was not diverted from Logan. Rather Logan's passenger traffic numbers grew by 3.8 percent in 1998, the highest since 1992" (DEIS/R ES-11).

Laurence G. Hanscom Field

37.85

Hanscom Field (Hanscom) is currently the only airport other than Logan owned and operated by Massport. It has been underused as a part of the regional air transport system. In comments on Massport GEIRs, Annual Updates and project filings, the City has long advocated for improvements to Hanscom that would make it an attractive alternative to Logan for both airlines and passengers. Its potential as a regional facility has been ignored in the DEIS/R and should have received substantial attention in the alternatives analysis.

The DEIS/R notes that no regional carriers have successfully served Hanscom in the past 15 years. As the City has noted in numerous past comment letters, Massport has not invested the funds necessary for infrastructure improvements that would attract cargo and regional service.

General Aviation (GA) activity (private and corporate aircraft) at Logan represents 6.2% of total airport operations. For the four quarters ending in December, 1998, Logan GA activity numbered 31,712 flights. GA flights now landing at Logan could easily be redirected to Hanscom since these are private and corporate, rather than commercial, aircraft. These planes are generally very small and delay larger commercial planes carrying many more passengers. Hanscom could be upgraded into a first-class destination for GA with facilities that would entice many private entities to make the switch. In combination with Peak Period Pricing at Logan, Hanscom could well become a convenient option for many travelers.

Hanscom could also be developed into a Northeast hub airfield offering service to major destinations such as New York, Washington D.C., Philadelphia, Pittsburgh, Cleveland and Detroit. This regional focus would allow suburban business people and residents the opportunity to fly to regional destinations as an end trip or as a connecting point to other destinations. The seven regional destination sites respectively rank 1st, 2nd, 8th, 22nd, 29th and 18th of the top domestic Origin and Destination markets in the U.S.

A problem for Logan is that Boston serves as a regional hub for most of the smaller cities of New England such as Burlington (VT), Portland (ME), Martha's Vineyard, Provincetown and Nantucket. Such cities are served exclusively by small regional and commuter aircraft. Such flights accounted for 40% of all flight operations out of Logan in 1998. Developing Hanscom as a feeder facility for flights within the Northeast could result in a reduction in Logan's flight operations significantly.

Finally, extending the MBTA's Red Line from Alewife to Hanscom should be considered as an access option as should a connection with the Fitchburg Commuter Rail line that now stops in Lincoln and Concord.

Worcester Airport

A December, 1995 Final Supplemental Environmental Impact Statement/Report (FSEIS/R) outlined improvements planned for the Worcester Airport (Worcester) and presented a section (2.0) titled Worcester Airport's Role and Potential for Growth. Worcester is designated by the FAA as a Primary Commercial Service Airport and, under the National Plan of Integrated Airport Systems (NPIAS), as a Transport-Short Haul Airport. It was designated for priority improvement funding by MAC in the 1989 Massachusetts Airport System Plan (MASP) and determined to be not capable of becoming a major hub airport. Its primary mission was identified as service to its own geographic market based upon regional business and economic needs and not to duplicate or handle the overflow from Logan.

A number of factors contributing to the limited potential for airport growth in Worcester were cited in the FSEIS/R. The airport is surrounded by steep topography and the wetlands that border tributaries to a public water supply reservoir, leaving little developable land. The airport's high elevation (1,009 feet above sea level) can limit operations by aircraft equipped to fly only under Visual Flight Rules (VFR) and cloud cover causes Instrument Flight Rules (IFR) traffic about 15 percent of the time. Lack of direct highway access and airspace constraints as a result of FAA safety regulations further restrict the potential for expansion.

The Worcester FSEIS/R cites a 1984 Massport survey of Logan passengers showing that about 238,000 enplanements came from outside of Route 495 with the Worcester Airport market generating approximately 256,000 total enplanements. The number of Logan enplanements represented a loss of one-half of Worcester's potential market to Boston. No information was provided regarding the destination of Worcester area passengers and the City questions if such data was gathered during the Massport passenger survey and might be useful in regional planning.

The Sabre Report, undertaken for MAC, claimed that at Worcester "a reasonable case can be made for initiating scheduled jet aircraft service into some of the more attractive northeast hubs" such as Newark, Philadelphia, Cincinnati, Detroit and direct service to four destinations in Florida (Sabre Report, p. 1-2). The study identified an advantage for Worcester because of "air traffic congestion and mounting ground access problems in getting to Logan." As for cargo, it found that much of the Worcester market's freight was trucked to Logan, even though truck drivers complain of problem traffic en route to and from Logan. It identified Federal Express and United Parcel Service (UPS) as having potential interest in Worcester. Yet, the report noted that, "The major problem for this airport is access. The airport does not have direct access to any interstate highways or other major limited access highways" (Sabre Report, p. 5-6). The study indicated that the maximum acceptable drive time from the highway to the airport would have to be no more than 5-15 minutes (Sabre Report, p. 8-25). The report further stated that the MBTA's Commuter Rail service to Worcester from South Station may siphon off more of Worcester's air travelers because the rail line does not extend from downtown Worcester to the airport, four miles away (Sabre, p. 5-50.)

37.86

Although Worcester may not serve as a primary reliever for Logan, it is fundamental that improved access, preferably off Interstate 90, be addressed first and foremost when planning to expand operations at this facility. In addition, heavily discounted Landing Fees, Gate Fees and a limited tax exemption for airlines serving Worcester Airport may help to attract service.

The discussion of Worcester's regional role in Section 2.3 of the FSEIS/R indicates MAC's acknowledgment in the MASP that capacity at Logan is a problem. It also appears that the issue of duplicating Logan's mission has been discussed. This recognition by MAC is significant and, once again, confirms the City of Boston's conclusion that increasing capacity is the guiding motivation behind Runway 14/32.

Fort Devens

37.87

It is our understanding that decisions have not yet been made regarding the use all of the land at Fort Devens. The City believes that evaluation of the site's potential role in a regional transportation system should be assessed. Data on land availability, ground access, suitable types of aircraft and infrastructure should be assembled and examined to determine if this site is a viable option for a reliever airport.

QUALITY OF LIFE: IMPACTS ON COMMUNITIES

37.88

The DEIS/R, like other Massport project documents, does not adequately address the very real problems and needs of those most affected by airport operations on a daily basis. The safety of Massport and airline staff and air passengers and the quality of passenger service is always accounted for. However, the quality of life of those who live and work in Logan's zone of impact is clearly not acknowledged. For example, the DEIS/R states that this five-year construction program will be conducted up to seven (7) days per week with frequent night work. This aggressive schedule reflects FAA and Massport priorities at the expense of neighbors. The DEIS/R also maintains that service levels at regional airports are primarily based upon the state of the economy and airline decisions, not community impacts. As another example, while the cost of delay for air passengers and airlines is estimated, there is no acknowledgment or discussion of the landside loss of personal and work-related time or the costs of impacts on residents and businesses.

37.89

The DEIS/R states that, due to the airside improvements project, areas such as parkland, farmland and cultural resources will not receive impacts or will receive insignificant impacts. This is inaccurate and one example is the projected increase in flights over Franklin Park. This parkland is an important resource in a dense urban area populated by many people of color and is on the National Register of Historic Places.

BASE YEAR AND FORECAST PLANNING PERIOD

Finally, as further evidence that this DEIS/R is insufficient, the City notes two issues fundamental to conscientious local and regional transportation planning: the choice of a base year for modeling and the forecast planning period.

37.90

The base year in the DEIS/R for modeling and forecasting is 1993, six years ago. Given the changes in fleet mix and other baseline conditions, 1993 is an inappropriate base year.

Projections for 1999 are inappropriately called "near-term" rather than 'current activity' and the year 2010, only 11 years in the future, is called the "long term." The DEIS/R short- and long-term time horizons do not conform with generally accepted planning practices or with FAA standards.. The result is an analysis that relies upon outdated information and inadequate forecasting. At a minimum, planning and forecasting for this project should carry through the year 2020.

In summary, the City of Boston believes that Massport's withdrawal of this document and the formation of a regional transportation panel is the most responsible way to enhance regional capacity. It will also ensure that the impacts inherent in accommodating economic growth are evenly distributed.

Thank you both for the opportunity to offer comment. The City look forward to contributing to the solution to our region's transportation needs.

Sincerely,

Andrea d'Amato
Chief of Environmental Services

CITY OF BOSTON · MASSACHUSETTS

OFFICE OF THE MAYOR
THOMAS M. MENINO

March 26, 1999

The Hon. Robert A. Havern III
Chairman
Joint Committee on Transportation
State House, Room 513
Boston, MA 02133

The Hon. Joseph C. Sullivan
Chairman
Joint Committee on Transportation
State House, Room 443
Boston, MA 02133

Dear Mr. Chairmen:

Thank you for allowing me to testify before your Committee last Tuesday on the proposed runway expansion at Logan Airport.

I endorse the proposal for the Commonwealth to create an independent commission to study the runway expansion at Logan Airport. And I would charge the commission to undertake a regional air traffic improvement plan.

I also suggest that the Commonwealth place a moratorium on the runway expansion project until this plan can be completed. There are far too many unanswered questions to allow the runway to proceed:

37.91

1) there are questions about Logan Airport's long term capacity to serve growing air traffic demand in the region, particularly the growing territory beyond Route 128; according to a recent New England Regional Air Service Study prepared for the Massachusetts Aeronautics Commission and the Massachusetts Port Authority under a grant from the Federal Aviation Administration, "Regardless of author or methodology, everyone agrees that Logan will soon be unable to meet demand"; another runway at Logan will not solve this problem if this is the case;

2) there are questions about whether already congested urban highways can absorb larger volumes of suburban traffic; in 1998, for the very first year, more than half of Logan's passengers came from beyond Route 128; the long term trend of growth at the metropolitan edge shows the Port Authority needs a strategy to serve businesses and passengers in the growing suburban market, without inviting more suburban vehicles onto congested urban roads; 37.92

3) there are questions about the environmental and economic impacts of more congested highways; the Port Authority projects Logan will soon serve 45 million passengers a year, up from 26 million in 1998; commuters who will share the roads with Logan's passengers and residents of surrounding communities who will share the air deserve an accounting of the environmental and economic costs of more traffic congestion and delays on urban roads; 37.93

4) there are questions about genuine causes of delays at Logan other than northwest winds, such as the inability of airlines to find attractive alternative airports in the region; if delays actually stem from airlines scheduling far more flights than Logan is capable of handling, then adding capacity will not solve the problem, it will only allow the problem to grow worse; in fact, the Port Authority projects delays of 59 minutes per flight by 2010; the only real solution is to improve other airports as more attractive alternatives for the airlines; 37.94

5) there are questions about Logan's high volume of small planes that could be accommodated at smaller, regional reliever airports; some 45% of Logan's flight capacity is planes with 40 passengers or less; small planes are inefficient users of airport capacity at peak travel times; without adding a runway, Logan can reduce this percentage through market mechanisms geared to relieve congestion, such as peak pricing; 37.95

6) there are questions about the suitability of alternative airports or the readiness of alternative regional airports to handle increased traffic and meet demand projections; the effects of physical improvements to existing airports, ground access infrastructure, as well as improvements to Logan Airport need to be studied in a regional context, not in isolation; 37.96

7) there are questions about the need to preserve available sites for potential air fields; with Logan at capacity, the state needs to reexamine the suitability of Ft. Devens for a new regional reliever airport to serve growing demand along the I495 and 128 corridiors; Ft. Devens is sited near I495, Route 2, and I195 to Worcester, as well as existing commuter rail lines; the advantages of existing ground access infrastructure at this site should not be overlooked; 37.97

8) there are questions about the regional economic benefits of airport expansion and infrastructure improvements at all facilities in the region, especially Worcester Municipal Airport; Hanscom Field in the Route 128 corridor; and the Ft. Devens site and its proximity to the I495 corridor, Fitchburg, Leominster and Lowell; and 37.98

9) there are questions about whether prohibiting a new runway at Logan would actually have any undesirable consequences to the efficiency of Logan's operations or the region's economy; Logan Airport is growing mightily without the runway anyway; when a new runway was proposed 25 years ago by Massport director Ed King, supporters said the region's economy would suffer if the runway did not open; in fact, the region's economy has exploded and traffic at Logan Airport went from 8 million passengers to 26 million a year. 37.99

I endorse your proposal for the creation of an independent commission, because a regional air traffic improvement plan is the only way for the Commonwealth and our neighboring New England states to study all of these issues in a regional context.

This region's economy, transportation networks, environment, and quality of life cut across too many boundaries to be addressed in isolation or by piecemeal approaches. That is why I call upon the Commonwealth to declare a moratorium on the new runway at Logan Airport until a regional air traffic improvement plan can be completed.

Sincerely,

Thomas M. Menino
Mayor of Boston

MAYOR MENINO SAYS MASSPORT RENEGING ON COMMITMENTS AND LACKS REGIONAL PLANS FOR GROWING AIR TRAFFIC

The following is Mayor Thomas M. Menino's testimony prepared for delivery at the State House on Tuesday, March 23, 1999:

"Mr. Chairman, I come here this morning on behalf of the citizens of Boston to declare my strong opposition to the runway expansion at Logan Airport. And I voice my support for legislation that will prevent that runway from opening.

My reason for doing so is simple. The runway is a violation of Massport's commitments that traffic at Logan would not grow.

I submit for the record testimony to that effect made by former state transportation secretary Frederick Salvucci in last week's *Boston Globe*. Mr. Salvucci said the state agreed to a cap on Logan traffic. He said, and I quote, "The commitment was clear." Now, in just a matter of years, Massport is reneging on that commitment.

37.100

I also submit for the record a report in this week's *Boston Business Journal*. I refer to comments made by former Massport executive director Al Raine, who served under the Weld-Cellucci administration. According to this report, and I quote, "Raine said the commitments were crucial in persuading East Boston residents not to mount what he believes would have been a successful legal and political fight..."

Mr. Chairman, there is a fight today because Massport said it would abide by a cap in air traffic. But now, Massport says there is no cap. That is how Massport deals with the people of Boston. They have pushed us before. They have pushed us time and time again. But this time, the people of Boston will not be pushed without a fight.

The only solution Mr. Chairman, is for the Commonwealth to get serious about a regional solution to a regional problem. 37.101

The runway is not a regional solution. It is a short term band aid, a temporary crutch, a quick fix for an agency that shows an incredible lack of regional vision. An agency with no long term plans for what to do after Logan fills up again.

Relying on other states to improve their airports is not a smart strategy for the Commonwealth. It leaves too much to chance. And worse, it gives those states a chance to capture the economic growth that will be drawn to an alternative airport. The Commonwealth could capture those benefits only if it builds another major airport to serve the region, or expand existing airports like Hanscom Field. Hanscom is in the best position to serve growing businesses along Routes 128 and 495. Not Logan. 37.102

Business people at the edge of the metropolitan region will not be well served by a new runway at Logan. Because the runway will put more airport traffic on the Expressway and the Massachusetts Turnpike. A new runway at Logan will only mean more congestion and delays on our highways. Those delays will mean lost time, lost productivity, and a loss of quality of life. 37.103

Mr. Chairman, I'm not anti-business. I'm not anti-development. I'm pro common sense.

The quality of life in Boston is what keeps our economy strong. Every business leader knows that greater Boston cannot compete with other regions based on the cost of living. We beat the competition because our quality of life ranks among the highest in the nation.

Adding more traffic to congested highways will only weaken our quality of life – and our regional economic advantage. Without an alternative airport, greater Boston has no regional advantage when it comes to air travel.

Yet, Massport has no serious plans for what to do when Logan reaches its new capacity. And until Massport gets serious about a regional solution to a regional problem, the people of Boston cannot take Massport's commitments seriously at all. 37.104

For the sake of our regional economy, and for the sake of our quality of life, I suggest that the Legislature stop the new runway at Logan Airport, and take all necessary steps to explore alternative ways of handling the growing air traffic in our region.

Opening another runway at Logan Airport is a band-aid approach to a problem that requires surgery. The most serious delays at Logan are caused by the lack of attractive alternative airports in greater Boston for airlines and consumers. Without appealing alternative options, more traffic will continue to go to Logan. But Logan can only accommodate so much. 37.105

According to Massport aviation director Thomas Kinton, "Ultimately there will be a ceiling that will be hit." (Boston Globe, 6/19/94) As far back as four years ago, Kinton said, "Logan can't continue to handle it all any more." (Boston Globe 11/28/95) As a Federal Aviation funded "New England Regional Air Service Study" put it, "Regardless of author or methodology, everyone agrees that Logan will soon be unable to meet demand."

More traffic at Logan will only mean more cars, trucks and shuttle buses on our congested highways and urban road system. Logan now serves 26 million passengers a year. Massport expects up to 45 million a year by 2010, an increase of nearly 80 percent. Imagine the impact on traffic on the Expressway or the Mass Pike during rush hours. 37.106

The majority of Logan's users came from beyond Route 128 in 1996. (Massport data.) Why? Growth is occurring at the metropolitan edge. And Logan remains greater Boston's only major airport. As more and more travelers fight traffic on urban roads to get to Logan, the people who work and live beyond Route 128 won't be able to get to Logan on time. Attracting more traffic to Logan will only make these delays worse.

Even Massport admits the new runway won't solve the airport's problems. According to a 1995 report in The Boston Globe, Massport's aviation director Thomas Kinton said the new runway at Logan "won't ease the congestion that now ranks Boston as the nation's fifth worst city for flight delays. This record undoubtedly will get worse, he said, if Logan's passenger traffic grows as expected, from 25 million people this year to a projected 45 million in 2010." (Boston Globe, 12/24/95)

For years, Massport planners have talked about relieving congestion at Logan by building a second major airport or expanding the use of the state's regional airports in Worcester and New Bedford. "Diverting travelers from Logan, they say, is about the only way that they can see to relieve growing congestion and delays in Boston." (Boston Globe 12/24/95) Yet, after years of talk and so-called plans, Worcester and New Bedford carry the lowest number of passengers of all of New England's ten largest regional airports. 37.107

Talk of a new runway has been around for 25 years. But Boston's economy and traffic at Logan Airport have grown without it. Even without a new runway, Boston's economy will continue to grow. And so will congestion at Logan – until the region comes up with a seriously overdue plan to meet its long term needs.

CITY OF BOSTON • MASSACHUSETTS

OFFICE OF THE MAYOR
THOMAS M. MENINO

April 7, 1999

The Hon. Robert A. Durand
Secretary of Environmental Affairs
Attention MEPA Office
100 Cambridge Street, 20th Floor
Boston, MA 02205

Dear Secretary Durand:

The Massachusetts Port Authority projects that passenger traffic at Logan Airport will grow from 26 million in 1998 to as many as 45 million by 2010, an increase of roughly 73 percent.

More passenger traffic at Logan Airport will only mean more cars, trucks and shuttle buses on our congested highways and urban road system. During peak travel times, this could make traffic congestion unbearable on the Southeast Expressway and Route 1A. It will also encourage more drivers to seek alternate routes, worsening congestion on roads such as Storrow Drive.

The majority of Logan's users actually come from beyond Route 128, according to Massport's 1996 data. These people are not getting to Logan via the Blue Line. They are driving long distances for great lengths of time on congested roads. As traffic at Logan expands, road traffic congestion will grow worse, more vehicles will slow to a crawl, and suburban travelers may not be able to get to Logan on time.

Putting more traffic on our urban road system during peak travel times raises the issue of whether residents near Logan Airport will be able to navigate their own communities and whether employees will be able to travel to and from work without further delays.

Finally, the addition of more vehicles to our roads raises concerns about environmental and economic impacts of traffic congestion, from air pollution to lost time and productivity. The region is already in "serious" non-attainment of the air quality standard for ozone, according to the U.S. Environmental Protection Agency.

Massport's Environmental Impact Statement/Report addresses none of this. It is incomplete, because it avoids the landside impacts of airport growth. Airside and landside impacts are related and inseparable. I therefore respectfully request that you require the Port Authority to provide a full and complete accounting of all the landside impacts of its improvement plan before proceeding any further. To do so would only deny the people of greater Boston the answers we deserve.

Sincerely,

Thomas M. Menino

BOSTON

April 20, 1999

Andrea d'Amato
Secretary
Boston Transportation Department
Boston City Hall
Boston, Massachusetts

Dear Secretary d'Amato:

As the Executive Director of the Boston Public Health Commission (BPHC), the City's health department, I am concerned that the Massachusetts Port Authority, the US Transportation Department and the FAA Logan Airside Improvements Planning Project, DEIR/DEIS, have not taken into consideration the health of Boston residents in their Logan Airport expansion plan. This is particularly worrisome because of the potential impact on some of the City's most vulnerable subpopulations who are already disproportionately affected by negative environmental factors. Furthermore, the failure to consider such matters appears to be out of compliance with President Clinton's Executive Order 12898 entitled "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations", which requires each federal agency to identify and address the environmental and health effects of its programs that particularly burden minority and low income communities. 37.108

Our recently released 1999 Health of Boston Report to the Mayor documents the ten leading causes of morbidity and mortality which include cancer, heart disease, respiratory disease, asthma and homicide among others. When these data are broken down by neighborhood, they show that some of the worst rates for these health problems are present in the low income/minority neighborhoods of East Boston, Dorchester, Roxbury, South Boston, Mattapan and South End. Because of the proposed redirecting of airport landings and take-offs as well as the increased automobile traffic, these very communities may be the ones most affected by the proposed changes.

Many of the most serious health outcomes in our Report have been shown to be related directly or indirectly to factors associated with outdoor/indoor air pollution (such as that produced by aircraft/and traffic emissions), noise and odor problems. The DEIR/DEIS claims that environmental impacts resulting from emissions, noise and odor are negligible or within established state and federal guidelines/standards. We questions this conclusion. Because many of the vulnerable demographic subpopulations are 37.109

already overburdened and susceptible to public health problems, any incremental insult from the environment, regardless of size, is potentially of significance.

37.110

The DEIR/DEIS proposes to use soundproofing to mitigate noise impacts in certain neighborhoods. The process of soundproofing residences and businesses can create indoor air-quality problems. And this would occur just at the time the BPHC is launching a campaign to identify and reduce contributing factors to high asthma/respiratory disease rates in the city. There is no acknowledgement of such secondary impacts in the DEIR/DEIS.

Furthermore, noise and odor impacts have been associated in some studies with decreased learning and increased aggression. In Boston's neighborhoods affected by the redirection and new traffic which will result from this project, decreased learning and increased aggression are issues of concern which should also be addressed.

37.111

The BPHC, strongly recommends that Massport, the US Transportation Department and the FAA commission the appropriate studies that will document whether or not there are real **health impacts** on affected Boston neighborhoods associated with the proposed Logan project. The BPHC is available to participate in the design and implementation of such an effort.

37.112

If you have any questions about this matter, please call me or John Rich, MD, MPH, our Chief Medical Officer, at 617-534-5264 or Ngozi Oleru, Ph.D., the Director of the Office of Environmental Health, at 617-534-5966.

Sincerely,

John Auerbach
Executive Director

COMMENTS OF THE BOSTON REDEVELOPMENT AUTHORITY ON THE LOGAN AIRSIDE IMPROVEMENTS PLANNING PROJECT DRAFT ENVIRONMENTAL IMPACT STATEMENT/REPORT (EOEA #10458)

Pursuant to regulations implementing the Massachusetts Environmental Policy Act (M.G.L., Chapter 30, Sections 62-62H and the National Environmental Policy Act of 1969, as amended (40 CFR, Part 1500) the Boston Redevelopment Authority has review the above referenced Draft Environmental Impact Statement/Report and is pleased to submit the following comments.

The Draft Environmental Impact Statement/Report (Draft EIS/EIR) for the Logan Airside Improvements Planning Project evaluates seven airside improvement concepts for Logan International Airport, including both physical improvements and administrative options, which have been packaged for analysis into four improvement alternatives, plus a no-action alternative. The preferred alternative, denoted as Alternative 1A, consists of the following improvements:

(1) Construction of a new 5,000 foot unidirectional runway 14/32 along the southwestern edge of the airport,
(2) Construction of a 9,300 foot centerfield taxiway located between Runways 4L/22R and 4R/22L,
(3) Several taxiways improvements, including reconfiguration of the southwest corner taxiway system, the extension of Taxiway Delta to Runway 4R/22L, and the realignment of Taxiway November between Runway 15L/33R and Runway 33L/15R, and
(4) Reduction of the approach minima for Runways 15R, 22L, 27, and 33L

Not included in the Preferred Alternative is peak period pricing, an improvement concept evaluated in some of the alternatives. The stated purposes of the Airside Improvements Project are to reduce current and projected levels of aircraft delay at Logan and to maintain and enhance safe operating conditions at the airport.

The Massachusetts Port Authority (the operational authority for Logan Airport) and the Federal Aviation Administration have presented a very detailed document identifying and evaluating the operational and environmental implications of various alternatives for reducing the aircraft delay problems at Logan. An extensive, and sometimes overwhelming, amount of information and data are presented for review. Although seemingly cogent arguments are presented to support the recommended actions, we nonetheless do have serious disagreements with much of the analyses and resulting proposals, some of which

admittedly are highly controversial. In our comments below we have, inter alia, attempted to suggest alternative solutions to the recognized transportation difficulties which presently exist and are projected to increase at the airport.

REGIONAL CONSIDERATIONS

To begin, we strongly support the position of Mayor Thomas Menino and the City of Boston that there needs to be a regional approach to resolving the current problems at Logan Airport. We firmly believe that the solution to these problems cannot be solved solely by improving conditions only at the Logan. The problems are considerably more complex and extensive, involving the entire New England region, and are compounded by the fact that only a single major airport is available to serve the region's principal city. A significant and growing proportion of travelers who use Logan live in outlying areas to the north, west, and south of Boston and could be far better served by existing regional airports such as Manchester, Worcester Municipal, and T.F. Green if these airports were as substantially developed as Logan. In our opinion, both the State and Federal governments have the obligation to devise a strategy to encourage and to ensure that a much higher percentage of the burden at Logan is relieved by regional commercial airports, which we are confident would welcome increases in regularly-scheduled passenger service. The dramatic growth at Manchester Airport in New Hampshire and at T.F. Green in Rhode Island – both of which reportedly grew at more than 50 percent this past year – clearly demonstrates that people are willing to use alternative airports to Logan if there is a choice for a particular market segment. Were the same level of effort devoted to improving the attractiveness and the facilities at these and other regional airports as Massport has put into the present proposals for Logan, a more realistic regional share of the air traffic burden should be able to be achieved.

37.113

We also want to express our support of the proposal of Mayor Menino that an independent commission, or "blue ribbon panel"' be established to study objectively the opportunities for regional air traffic improvements and the environmental and economic impact of further expansion at Logan. This commission should explore, along with the greater use of the existing regional airports, the possibility of developing a second major airport (which could be one of the regional airports) to serve the region's growing economy and demand for service. Until such a panel has had the opportunity to devise a feasible and acceptable regional aviation transportation strategy, we would recommend a moratorium on any new airside construction or expansion at Logan, save for those actions needed to ensure the safe operation of the airport itself. We likewise support the Mayor's suggestion that a regional New England Port Authority be established to implement a regional transportation strategy, replacing the limited focus of Massport.

37.114

37.115

REGIONAL AIRPORTS

Manchester/T.F. Green

Regional airports offer a highly feasible resource to attract a large proportion of demand from Logan. Manchester and T.F. Green Airports, for example, already are demonstrating their ability to act as major alternatives to Logan.

Manchester Airport in Manchester, New Hampshire handled 1.94 million passengers last year, compared to just 108,000 in 1984 and 700,000 in 1990 (an astounding 1,685% increase); and an estimated 2.5 million are expected to use the airport this year, growing to 3.2 million people in the year 2000, making Manchester the fastest growing airport in the country. Between 1992 and 2004, Manchester Airport will have been entirely rebuilt, including the lengthening of its two runways and ILS upgrades to accommodate its growing demand, and plans are proceeding to construct a toll-free access road connecting Route 3 with the airport's terminal. Three new airlines have begun service at Manchester in the past year, and just recently airport officials announced that at least three additional airlines are considering starting flights at the airport.

T.F. Green Airport in Warwick, Rhode Island, just south of Providence, has a new $225 million, 19-gate terminal and also is growing rapidly. In 1990, the airport served about 2.25 million passengers, which more than doubled to 4.5 million in 1998 as a result of affordable fares and convenience. Studies have shown that about 30 percent of Green's traffic comes from Massachusetts, traffic that otherwise most likely would have gone to Logan. This number is expected to grow dramatically in the next few years due to plans (noted in the Draft EIS/EIR) of the Rhode Island Department of Transportation to build a new MBTA commuter rail station at Green, effectively linking Boston to the Warwick airport with as many as eight trains daily. The project also includes a moving sidewalk to take passengers from the trains to the terminal.

Worcester Municipal Airport

Worcester Municipal Airport, currently mostly underutilized in spite of significant marketing, technical, and planning assistance by Massport in recent years, offers another excellent potential for capturing a large share of air traffic from Logan. Worcester Airport has four jetways, with new lighting to ease a frequent fogging problem, and additional improvements are planned within the next few years. In 1989, approximately 380,000 passengers passed through the airport, but that number has declined to 76,000 today. At peak capacity, Worcester reportedly could handle 1 to 2 million passengers a year and this easily could serve the estimated 1.5 million people from central Massachusetts who fly out of Logan annually. Critical to its success is improved highway access from the Massachusetts Turnpike and from Interstate 290, and possibly even a link to the Worcester commuter rail service. We are especially pleased that Massport

recently announced plans to take over operations, and eventually ownership, at Worcester Municipal Airport. This is a first step in the right direction to develop a regional solution to Logan's capacity and delay problems. In the meantime, we strongly urge Massport to put the same energy in promoting and developing the use of Worcester as an alternative to Logan as it has in developing the Airside Improvements Project.

Pease International Tradeport

Curiously, little attention was given in the Draft EIS/EIR to the opportunity offered by Pease International Tradeport just outside of Portsmouth, N.H. Pease has an unusually long 2-mile runway and recently completed a $5.6 million international terminal, including custom facilities. According to airport officials, Pease currently handles approximately 30,000 general aviation , cargo, and military operations per year, but expects to increase that number to 100,00 by 2010, with more than 40,000 passenger flights. The airport is actively soliciting charter flights, cargo service, and in particular international flights and has the capacity to expand its services substantially. While its single runway may be a drawback, Pease, along with Manchester, deserves to be considered as a feasible alternative to Logan for those passengers living and working north of Boston.

DELAY ANALYSIS

37.117

As numerous commenters have stated, we believe that the delay data and analysis used by Massport to support its proposals, especially the new Runway 14/32, is highly questionable and overstates the actual problem. While we do, of course, acknowledge that aircraft often are delayed at Logan, this is a situation that is no different than what occurs at any major airport. In fact, it has been reported that even Denver's new state-of-the-art Centennial Airport had 29 percent of its flights delayed last year, higher that Massport's claim of 25 percent for Logan.

37.118

We believe that Massport's analysis basically is flawed for several reasons. First Massport chose to develop its own model (DELAYSIM), rather than an accepted FAA model to determine delay. Further, Massport based its model on data from 1993, a peak year for delay at Logan, rather than averaging several years of data (as it did for the weather data, arguing that use of a single year would misrepresent normal conditions. Thus, there is an obvious inconsistency in Massport's use of data to support its position.) In fact, FAA statistics on delay at Logan since 1993 have indicated an approximate 19 percent decrease in delays between 1993 and 1998, information not included in the Draft EIS/EIR. As a result, we feel that Massport's delay projections are unrealistically inflated.

In addition, in contrast to Massport's estimates of an approximate 25 percent delay at Logan, FAA data indicate the problem to be substantially less, with only slightly over 3 percent of operations delayed at Logan in 1998. This difference is

due to the fact that the FAA considers any flight arriving or departing within 15 minutes of the published schedule to be on time, whereas Massport considers any flight which does not arrive or depart as scheduled to be delayed. We believe that the FAA methodology is more realistic of actual operating conditions, due to the many uncertainties involved in air travel (changes in weather conditions, conditions at connecting airports, etc.) and that air travelers generally expect slight delays. Also missing from the equation are the times when aircraft arrive ahead of schedule.

Further, by considering only the scheduled time of departure or arrival at Logan as the sole determinant of delay, Massport's methodology ignores situations which are entirely external to Logan, such as delays at originating or destination airports due to adverse weather conditions, over-scheduling, or other reasons (a flight which is delayed in arriving at Logan because of delayed departure from another airport due to adverse weather at the airport, for example, is not a delay problem for which Logan is responsible). Since the Draft EIS/EIR does not present any comprehensive analysis of the several potential causes for delay, the conclusions are misleading.

In sum, then, we feel that the data and methodology used by Massport to calculate existing and future delay do not realistically portray the normal operation of a major U.S. airport and overstate a problem in order to support a pre-conceived program of airside improvements.

PART 150 STUDY

Prior to the construction of the proposed improvements, we recommend that Massport conduct a Federal Aviation Regulations (FAR) part 150 noise compatibility study, which would set forth measures to be taken by Massport to reduce incompatibility in land uses and prevent additional incompatible land uses in the vicinity of Logan Airport. A Part 150 study, in turn, would trigger an FAR part 161 study for a program of noise abatement and restriction, which could provide for a voluntary control of the number of flights to Logan through agreements between Massport and the airlines serving the airport. 37.119

We believe that limiting or restricting uncontrolled growth of operations at Logan is imperative and could serve as an alternative means to reduce the current and projected future flight delays. We note again that although Logan (in 1997) was the 17th busiest airport in the U.S. in terms of passenger traffic, it was 11th in aircraft operations and that generally over the past fifteen years, the number of flight operations have increased at a higher rate than the growth of air passengers. Because the growth in flights exceeded the growth of air passenger traffic, passengers per flight at Logan have actually declined (from 58 to 56 passengers). The result is a tendency for an increasing number of aircraft to carry a lesser number of passengers. Rather, the goal for Massport should be to establish a demand management policy which could encourage airlines to 37.120

maximize load factors. Eliminating or consolidating flights to provide higher load factors than presently exist would, in turn, not only reduce the number of operations and maximize airline revenue, but also result in delay reduction.

RUNWAY 14/32

37.121

The major element of the Logan Airside Improvement Planning Project is the proposed construction of Runway 14/32, a new 5,000 foot runway to be located along the southwestern edge of the airport. According to the Draft EIS/EIR, Runway 14/32 would be designed as an unidirectional runway, with all arrivals over Boston Harbor to the Runway 32 approach and all departures from the Runway 14 end out over the harbor. His new runway has been proposed to address the principal cause of delay at Logan – the substantial drop in airport capacity that occurs when moderate to strong northwest/southeast winds force the airport to operate with fewer than three runways – by providing a second effective parallel runway in the northwest/southeast orientation.

The City of Boston has consistently opposed this proposal, which was originally included in the 1970 Airport Layout Plan. Construction of this runway actually began in 1974 but was halted as a result of an injunction successfully obtained by the City and East Boston residents. The injunction remains in effect to this day. While we acknowledge the fact that construction of Runway 14/32 could, to some extent, reduce the occurrence of delays at the airport – although delay would only minimally be reduced; by Massport's own analysis, future projected delay would be reduced by only approximately 20 percent – and could help the FAA to achieve better compliance with the runway use goals set forth in the Preferential Runway Assignment System (PRAS), we feel that a fair and equitable distribution of aircraft operations can be achieved through alternative measures and without the construction of a new runway. In particular, we would recommend that Massport officials work together with FAA tower personnel to thoroughly examine the PRAS program to determine whether there may be appropriate changes to the program that would result in a superior noise abatement policy to that currently in place. In addition, as detailed earlier in this letter, we believe that taking a more long-term regional approach to resolving the delay/capacity problem at Logan would be far more environmentally beneficial to further runway construction at Logan.

37.122

In examining the extensive data presented in the Draft EIS/EIR, we conclude that the alleged benefits of constructing Runway 14/32 may be highly overrated by Massport. In fact, according to Table 4.5-1, total annual delay hours for the 2010 High Fleet scenarios would be greater with the implementation of Massport's Preferred Alternative 1A (which includes Runway 14/32 but excludes Peak Period Pricing) than for Alternatives 2 and 3. Massport predicts that in a 37.5 million High Fleet passenger scenario, there would be 249,600 total hours of delay with the implementation of Alternative 1A, whereas with implementation of Alternative 2, which omits construction of Runway 14/32 but includes Peak

Period Pricing, total delays would drop to 208,300 hours. With implementation of Alternative 3, which excludes any infrastructure changes but includes Peak Period Pricing and the reduction in approach minima, total annual delays are reduced to 213,200 hours. Similar percentages in the total annual hours of delay occur under the 45 million High Fleet scenario. Presumably, the same conditions would occur under a 45 million Low Fleet scenario, because of its similarity to the 37.5 million High Fleet scenario. Only under the 37.5 million Low Fleet scenario, where non-jet , commuter operations represent a smaller share of the fleet serving Logan, would construction of Runway 14/32 alleviate a greater share of the delay. Thus, if a High Fleet scenario develops at Logan, the construction of Runway 14/32 becomes more of a hindrance and is no longer effective without additional mitigation measures. This analysis also points to another problem. Since the High Fleet assumes a fleet mix with significant regional operations at Logan, an improvement could only occur if there is a substantial transfer of the regional operations from Logan to other airports, as we have recommended above.

37.123

37.124

Implementation of Runway 14/32 will result in substantial noise impacts on many of the greater Boston area communities. Although operation of the runway would cause a shift in flight tracks and the volume of flights over certain communities, lessening the intensity of noise, it would increase the noise impacts, in some areas dramatically, in several other neighborhoods. Overall, implementation of Runway 14/32 would widen the scope of communities exposed to noise levels equal to or greater than 65 db by 2 percent, over the other alternatives.

37.125

Although Massport claims that Runway 14/32 would be unidirectional only and that conditions would be placed on its use to restrict any future change to unidirectional use, there can be no guarantee that a change would, in fact, not happen. It is our understanding that Massport will not agree to any legally-binding agreement to maintain the unidirectionality of this runway in perpetuity. Should bidirectional use of this runway be implemented sometime in the future, this would result in significant, and potentially dangerous, impacts, particularly on the Jeffries Point neighborhood of East Boston, in terms of noise, air quality, odor, and safety issues. Adverse impacts also could seriously affect the now-developing South Boston Seaport community and could hinder future plans for this area.

37.126

We also have some concerns with the type of aircraft that would use Runway 14/32. Although Massport states that the primary users of the runway would be the smaller regional jets and turbo prop commuter aircraft, the runway would be provided with a larger safety area to accommodate "occasion use by larger jets" (pg. 3-24). Moreover, Massport has selected an Airport Reference Code (ARC) of C-III, which would allow use of the runway by larger jet aircraft such as the Airbus, Boeing 727 and 737, and MDC DC-9 series. In addition, the Runway 32 NAYAIDS is to consist of a localizer and glide slope for precision guidance, again serving larger aircraft. Thus it appears that Massport intends greater use of

37.127

Runway 14/32 for larger jets than it has presented in the Draft EIS/EIR, having categorized the runway as essentially a commuter runway.

37.128

Another issue is that of airfield capacity. Although according to Massport the maximum available capacity is 120 operations per hour (with a 3-runway configuration), this capacity is available only about 80% of the year. With Runway 14/32, actual capacity, and thus the number of operations, would increase to more closely approach 100% utilization. Furthermore, the inducement factor needs to be considered; a reduction in delay could result in an attraction for a greater number of flights at Logan. Correspondingly, under both of these conditions, there would result an increase in noise and air quality impacts.

CENTERFIELD TAXIWAY

The proposed Centerfield Taxiway would be a new 9,300 foot taxiway located between Runways 4L/22R and 4R/22L. This runway is designed to reduce taxiway congestion and to facilitate a more efficient movement of aircraft between terminal areas and runways during take off and landing procedures.

We have two major concerns with this proposal.

1. Safety Issues - Parallel runways 42/22R and 4R/22L, which are among the most heavily-utilized runways at Logan,[1] are separated by only approximately 1,300 feet. The proposed Centerfield Taxiway would be located between these two runways, and much closer to 4L/22R than to 4R/22L. We seriously question the safety of proposing a taxiway between these two busy runways, which we believe could be a problem for a pilot who, on approach to either runway, is not familiar with Logan Airport or when there is extremely low visibility. Although the surface lighting would be different, there does exist the potential for a pilot to mistake the taxiway for a runway and to land an aircraft on the taxiway itself, rather than on a runway. (On at least one occasion recently, a pilot did land his aircraft on the wrong runway, rather that the assigned runway, because of the confusion of the two parallel runways.) With this potentially dangerous situation, we believe that implementing the Centerfield Taxiway could be a recipe for disaster, especially if there are airplanes waiting on the taxiway.

37.129

2. Environmental Issues - The addition of Centerfield Taxiway would provide an alternative route to Taxiway November to approach Runways 22L or 22R. Since neither the FAA nor Massport would agree to limit the number of aircraft which could use this taxiway, the number of aircraft which could approach this end of the airport would be very high, and would be added to

37.130

[1] In 1997, 38% of all arrivals at Logan occurred on Runways 4L/R and 11% on Runways 22L/R; 37% of all departures occurred on Runways 22l/R.

those aircraft using Taxiway November. (Currently, at peak periods, the number of aircraft on Taxiway November enroute to runways 22L/R for departures usually total 10 to 15. Since Taxiway November is 3,800 feet in length, the number of aircraft requesting permission to use the Centerfield Taxiway, could nearly triple.) With a large number of aircraft using the Centerfield Taxiway, there obviously would be a substantial increase in noise, air pollution, and odor impacts on the Bayswater section of East Boston, which is located opposite the proposed alignment of this taxiway. These impacts especially would occur during the summer months, when southwesterly winds are the most common in Boston. Accordingly, we would seriously question Massport's claim of air quality and noise benefits of constructing the Centerfield Taxiway.

REDUCED MINIMA

This proposed operational improvement would reduce the approach minima of Runways 22L and 27 to ILS Category I values and on Runways 15R and 33L to Category III values, consistent with current industry standards at other major airports, to allow for greater use of these runways under certain unfavorable weather conditions. Reducing the minima would lower the decision height at which a pilot must make a decision to land or to execute a missed approach procedure at times when visibility is low.

For Runways 22L and 27, the proposed decision height would be lowered from the existing 420 feet and 460 feet respectively to 217 feet. For Runway 15R, the proposed decision height would be reduced from the current 268 feet to only 18 feet and for Runway 33L, from 217 feet to 17 feet. [We note that the figures in Appendix D showing the existing and proposed ILS minima (Figures 1-3) are very misleading, since the glide path angle is only 3.0 degrees, but the figures show an angle of approximately 40 degrees (due to the difference in vertical and horizontal scales), which leads to a distortion of the height an aircraft is over a particular neighborhood.]

With the exception of the proposal to lower the minimum for Runway 33L, the approach to which is over Boston Harbor,[2] we do have serious concerns with the other proposed reductions, especially in light of the minimal benefits achieved, and therefore we are opposed to this proposal. Our concerns relate to safety considerations, as well as increased noise impacts.

---

[2] In fact, the City of Boston originally proposed that Massport work with the FAA to consider installing a Category II or Category III loading system on Runway 33L, in order to offer some relief to residents of South Boston and Dorchester from excessive noise impacts during inclement weather. It also would increase the margin of safety to these neighborhoods by transferring some flights to an over-the-water approach.

1. Safety Considerations – For the most part, the approaches to these runways are located over heavily-populated residential neighborhoods. The approach end of Runway 15R is located approximately 3,000 feet from the Eagle Hill neighborhood and the Day Square section of East Boston, as well as over the Mobil Oil farm. For Runway 22L, the approach passes closely over homes located in the Orient Heights section of East Boston, some 30 of which are located in the Runway Protection Zone (an area designated by the FAA as one which should be clear of any structures, especially residential). The approach to Runway 27 is over the Port Shirley neighborhood of Winthrop. Reducing the visibility minima for these runways could have serious safety consequences for these residences. Since arrival is the most difficult and challenging portion of a flight, our safety concerns are based on the premise that the poor weather conditions and reduced visibility, which would trigger the use of these lower landing minima, would only serve to exacerbate a pilot's work load during the landing procedure. With the high number of residents living in close proximity to the touchdown points of these runways, we believe that lowering the safety standards would leave these residents in peril and could result in a tragedy at any time (especially with the reduced decision height of only 18 feet for Runway 15R). 37.131 37.132

2. Noise Impacts – We disagree with the assertion of Massport that lowering the landing minima would result in noise benefits for the residents living under the approach paths to the subject runways. At the present time, if visibility conditions are such that it becomes difficult for a pilot to see a particular runway, the FAA will close down that runway and assign a secondary runway, if available, or depending on the severity of the situation, close down the airport entirely until there is an improvement in weather conditions. Lowering the landing minima potentially could result in greater use of these runways during poor weather conditions, exposing nearby residents to greater noise levels and more frequent disturbances than they currently experience.

   Aircraft operations during inclement weather tend to expose nearby residents to higher noise levels than under normal operating conditions. The reasons are two-fold. First, during severe weather conditions involving strong winds and rain, a pilot must apply a greater level of thrust to maintain stable flight, resulting in higher noise levels and thus increased adverse impacts for residents under the flight path. Secondly, since a low cloud cover usually is present under conditions which would trigger lower landing minima, noise levels from aircraft events would be amplified in intensity and would tend to last longer than on a clear day, further affecting residents under the approach path.

   In addition, should it be necessary for a pilot to execute a missed approach procedure, the lowered decisions points (as low as 17 feet) would require the pilot to apply a much greater level of thrust than at the current decision point

level in order to gain the necessary height to resume flight, resulting in much higher noise levels and further exacerbating the adverse impacts on nearby residents.

Therefore, based on the above considerations, we believe that lowering the landing minima will not serve to reduce the noise burden but rather will tend to increase the impacts that residents already have to endure.

However, even granting the possibility of some noise reduction, though slight (as described in Appendix D), we believe that the benefits are extremely minimal, especially when compared to the substantially increased safety concerns. Table 2 in Appendix D indicated an insignificant gain of only 8 hours in total airport runway availability with the proposed minima, and Table 3 indicates a reduction in average delay per operation of a mere 0.7 minutes. Table 3 also reveals an increase in total annual hours of dwell exceedence of 86 with implementation of the reduced minima, as well as an increase of total hours of persistence exceedence of 186, hardly an improvement in noise conditions for affected residents.

TAXIWAY IMPROVEMENTS

A number of taxiway improvements also are proposed to improve taxiway improvements, in order to reduce taxiway congestion, enhance airfield safety and facilitate operating efficiencies. These improvements include:

1. The reconfiguring of the Southwest Corner Taxiway System to streamline taxiway flow in a very complex area for ground operations and to improve access by isolating lines of traffic flow from each other;

2. The extension of Taxiway Delta to Runway 4R/22L by constructing an additional 2,000 feet of taxiway between Runway 33L and Runway 4R; and

37.133

3. The realignment of Taxiway November between Runway 15L/33R and Runway 33L/15R to eliminate an existing complex intersection and simplify the crossing of Taxiways Alpha and Kilo.

Since these improvements are designed to enhance airfield safety by eliminating confusing or problematic alignments and intersections, we support their implementation at this time.

PEAK PERIOD PRICING

37.134

The concept of "peak period pricing", originally proposed by Massport as an element of the Logan Airside Improvements Planning Project, has been rejected by Massport, in spite of its overwhelming support. Peak period pricing is designed to reduce delay by eliminating flights during periods when demand

exceeds an airfield's capacity for a sustained period of time, and to induce a shift in aircraft operations to less congested hours of the day. Massport has eliminated this improvement based on a claim that airline over-scheduling is not currently a problem at Logan (although it was in 1993, which is used as the base year by Massport for modeling future delays) – again an example of the lack of consistency in the use of data by Massport to support its proposals) and is not projected to be a problem in the near future, in addition to projected economic impacts to certain regional airlines. We do not agree with these conclusions, particularly since the Draft EIS/EIR itself (page 4-2) acknowledges that under long-term High Fleet scenarios "peak period pricing could provide meaningful delay benefits by reducing airline over-scheduling that emerges as a contributor to Logan delays within these flights" (emphasis added).

We strongly support the concept of peak period pricing and believe it can be a key mitigation measure to reduce congestion, and thus delay, at Logan and that it can be a feasible alternative to new runway construction at the airport. This proposal, originally but forth by Massport itself in 1993,[3] was projected to reduce peak hour activity by approximately 10%, producing a very substantial reduction in the expected amount of delay at the airfield (during the peak period, Massport estimated that a 5% reduction in the use of the airport would cause at least a 20% drop in average expected flight delays). According to the Massport report, this reduction in delay would be expected to come mainly from a reduction in commuter activity during peak hours, and especially from markets with ready commuting alternatives. Further, Massport estimated that 7% of the peak period weekday flights, representing only 3% peak period weekday seats, would be cancelled,[4] with a smaller percentage rescheduled to non-peak hours. Thus Massport concluded that adopting of peak hour pricing would have minimal adverse impact but would benefit the passengers and airlines using Logan Airport during peak hours.

Peak period pricing also was endorsed by a National Jury convened at an August, 1994 conference (the Boston Conference-Shaping the Accessible Region) held in Boston to lay out priorities for transportation, economic development, and the environment in the metropolitan Boston region in the first decades of the 21st century. The Jury recommended that the Commonwealth adopt "congestion pricing'...to mitigate bottlenecks and delays at Logan that would impede the region's future economic growth" and further stated that it believed "that this approach offers a relatively inexpensive and flexible demand

---

[3] Massachusetts Port Authority "Peak Hour Pricing at Logan Airport", April, 1993

[4] Massport, "Logan Airport Peak Hour Pricing Plan-Briefing to DOT and FAA," June 9, 1993

management strategy, prolonging the use of Logan as its present location without requiring controversial runway expansion."[5]

We further note that the U.S. Environmental Protection Agency, in its comment letter on the proposed scope for the Draft EIS/EIR, (Volume II, Letter 1, pp. 2-3) strongly supported the concept of peak period pricing and recommended that Massport and the FAA institute such a pricing policy at Logan, noting that it had been applied effectively in the utility and telephone industries to mitigate the effects of peak period volume and to roads to alleviate congestion, with resulting environmental and economic benefits.

Massport claims, based on case studies included in the Draft EIS/EIR (Appendices F and G), that institution of peak period pricing would result in serious economic impacts on smaller regional airlines, such as Cape Air, which serve Cape Cod and the Islands. However, we seriously question the analyses and conclusions of substantial flight reductions. According to data presented in the studies, the projected cost increases would range from approximately $4.50 to approximately $13.00, which are hardly substantial increases and most likely would be recovered, at least partially, in the form of slightly higher fares. At the same time, the analyses lack some vital information by which Massport's conclusions can be evaluated. The studies do not indicate the current fares from the several originations. Therefore, we cannot determine the percentage of an existing fare that a potential increase would involve and whether it would be minimal, and thus well within a customer's ability to absorb, or not. Further, the studies do not indicate alternative costs to flying from these locations, such the cost of a ferry and automobile trip from the Islands to Boston, by which one could compare the costs of air transportation. Nor is there any analysis of the potential to use other airports, such as T.F. Green near Providence, to reach one's destination. Thus without sufficient comparative information, we cannot concur with the economic analysis presented by Massport.

In addition, we note that, according to the Summary of LAIPP DELAYSIM results table in Appendix H, Massport's selected Alternative 1A (all actions except peak period pricing) would result in considerable more hours of delay, particularly for the 2010 37M and 2010 45M High projections, than Alternative 1 (all actions), clearly indicating the significant delay reduction potential of peak period pricing.

In conclusion, therefore, we strongly believe that Massport should institute a program of peak period pricing at Logan, at least on an interim basis, to determine its actual effect on reducing delay before deciding to proceed with the more controversial, and questionable, runway or taxiway expansion proposals and reduced minima, all of which we feel require further study.

---

[5] Harvey B. Gauth, et al, "The Boston Conference: Final Report – National Jury Recommendations, August 24, 1994, page 5.

ADDITIONAL POINTS FOR CONSIDERATION

1. Page 5-34 (top paragraph) – One could question the use of modelled runway use rather than actual effective runway usage in the noise analysis; does this not distort the analysis? 37.135

2. Page 5-61 – Construction of the Centerfield Taxiway will displace the nesting sites of the upland sandpiper, a State-listed endangered species. The Massport mitigation plan proposes to relocate these birds off-site to Cape Cod. One could question whether a more local site would be more appropriate. 37.136

3. Page 6-43 (Tables 6.2-14 and 6.2-15) – The differences between alternatives are not significant or are imperceptible. (Similarly with Tables 6.2-22 to 6.2-29) 37.137

4. Page 6.81-6-83 (Tables 6.3-10-6.3-14) – The air quality differences among the alternatives is not significant. 37.138

5. Page 6-100 (Table 6.6-1) – There are errors in the mean for arsenic, chronium, and lead (see Table 5.6-2, page 5-74). 37.139

6. Page 6-117 (Nighttime construction) – Nightime construction is scheduled for Runway 14/32, the Centerfield Taxiway, Taxiway November, and possibly elsewhere. The impact on the adjacent East Boston community (Jeffries Point, etc.) needs to be addressed (should construction proceed). 37.140

7. Page 123 – Barging, rather trucking, should be considered for the removal of earth from the airport (also, barging in soil and construction materials) to reduce construction vehicle traffic. 37.141

8. Page 8.5 (Figure 8.2.1) – This figure is incorrect (actually it is the same as Figure 8.2-2). 37.142

Re: EOEA #3247/5146 - Boston Logan International Airport
1997 Annual Update

Dear Secretary Coxe:

The City of Boston Environment Department has reviewed the above referenced 1997 Annual Update (Update) and hereby submits the following comments.

The Update prepared for the Massachusetts Port Authority (Massport) indicates that Logan International Airport served 25.6 million passengers in 1997, a 1.7 percent increase over 1996. Domestic passenger activity increased by 1.2 percent, international passengers by 4.7 percent, general aviation passengers by 18.1 percent, aircraft operations by 5.8 percent and air cargo volume by 7.1 percent. General aviation (unscheduled) flights increased by 12.7 percent. Such flights are generally executive transportation and delivery of medical and financial products. The airport was the 11th busiest in the United States and the world ranked by number of aircraft operations.

This department has compiled, and attached to this letter, a set of guidelines for both the construction and operating periods of projects. These guidelines are designed to protect the environmental health of those who live and work in Boston in both the short and long term. We ask that Massport follow these guidelines and include them in the Guide to Tenant Construction referenced in previous environmental filings. This tenant guide should be reproduced in the next Generic Environmental Impact Report (GEIR).

Air Quality

Massport has clearly taken seriously the benefits of alternative fuels in equipping its shuttle bus fleet. The Update also notes, as did the 1996 document, that incentives are offered for private fleet and airside service vehicle owners who use alternative fueled vehicles (AFVs). How many of these owners have taken advantage of the incentives and what percentage of the total do they constitute? Is the 25 percent discount a sufficient incentive? Would a greater discount or free curb access for AFVs significantly increase their use without severely impacting Massport's revenues?

Bio-diesel is identified in Table ES-5 as a "clean" fuel. However, this designation is still very much in dispute. We recognize that some experts consider it a transitional technology to cleaner operations. However, CNG and other alternative fuel technologiess are well established, bringing

into question the need for a transitional technology. For this reason, we are concerned about the expenditure of substantial funds to purchase AITC Red Route vehicles that use bio-diesel.

We encourage Massport to seize this opportunity to fully and aggressively promote truly clean vehicles.

While Stage 3 aircraft are more fuel efficient and provide some decrease in noise levels over Stage 2 aircraft, they increase NOx emissions. We concur with the Boston Transportation Department (BTD) that it is important that Massport and the Federal Aviation Administration (FAA) make the aircraft industry aware of the pressure to produce quiet engines that do not increase pollutant emissions. In addition, as Ground Service Equipment (GSE) is projected to be the future source of most CO increases, Massport and the FAA must work with manufacturers of such equipment to improve rates of emission.

As this and other City departments have stated in prior letters, we strongly support a consolidated car rental facility at Logan. We also restate our concern that Massport continues to examine the possibility of moving bus servicing and other operations to off-airport locations. As the air quality implications are potentially significant, this issue must be discussed with the community. In addition, information must be provided to the community and reviewers regarding the number of vehicle trips this would add to current levels and the potential new uses for space now occupied for car rental and bus servicing.

We thank Massport for posting "no idling" signs at the bus/limo and taxi pool areas. Once again, we ask that permanent signs be posted at all service areas, loading docks, and other areas where vehicles are likely to idle advising vehicle drivers of the law and Massport's expectation of compliance.

We question Massport's statement that "$PM_{2.5}$ data for aircraft do not exist at this time." This is surprising since aircraft engines have undergone emissions testing for many years. We request that the GEIR contain a comprehensive literature search on this issue.

Energy/Resource Conservation Recycling

We are concerned about the estimated volume of fuel released during spills in 1997 as the amount spilled in 1996 was reported to be the result of lack of attention by a fuel provider and customer allowing for the leakage of a very substantial amount of fuel. Massport first notes in this Update that the number of fuel spills is down. However, it is then explained that the volume spilled has increased but that regardless of the amount spilled, it was less than the average annual volume spilled since 1990. When annual volumes are averaged and they include the 18,000 gallons spilled in 1995, the overall average number of gallons spilled for the last eight years is skewed and the analysis makes individual yearly spills pale in comparison.

It would appear that airport tenants require continuing education on spill prevention and that Massport must monitor this issue more closely.

There is currently limited recycling at Logan and we encourage its expansion to include glass containers, metal containers, cardboard, newsprint, white paper, milk cartons, juice boxes and plastic containers designated from 1 to 7. Increased recycling rates are likely to be required in the future in order to slow the demand for additional landfill space and incineration facilities both in and outside the Commonwealth. Massport should consider the long term in this area, particularly when facilities are being renovated or replaced. Light ballast recycling can easily be added to Logan's current program. We refer Massport to the enclosed guidelines for information on WasteCap of Massachusetts and the Recycling Service Directory and Markets Guide for Massachusetts.

We thank Massport for recycling water used during fire fighting training activities.

Again, we request that future GEIRs and Annual Updates contain distinct sections devoted to the issues of energy/resource conservation and recycling.

Ground Transportation

We congratulate Massport on the success of the Logan Express high occupancy vehicle (HOV) service for passengers and employees (a 29 percent employee increase) and we expressed our support for the Woburn Regional Transportation Center in our comments on the recent draft Transportation Implementation Plan (TIP). The Update indicates that the South Station bus dock dedicated to trips to Logan was a success but ridership numbers were not provided. This should be fully reported in the GEIR.

In 1997, scheduled and non-scheduled HOV ridership reportedly increased by 6.8 and 7.0 percent respectively above 1996 levels. While we are pleased to see HOV increases, we question as we did in response to the 1996 Update how single party transportation by an unscheduled commercial provider is considered an HOV service. A means of transit should not be considered high occupancy unless there are three or more air passengers in the vehicle. A private, on-demand service that transports one passenger to Logan is not an HOV, but functions as does a taxi. Again, future air passenger surveys, information asked of registered providers and Transportation Services Unit statistics should distinguish between the use of vehicles containing less than three air passengers and those containing three or more air passengers (true HOVs). Current and projected mode share statistics should then be modified as necessary to reflect the difference.

On a related matter, from a regional transit and air quality perspective, shuttling about 2,000 employees to the airport who have driven to a parking lot in Chelsea in single occupant vehicles should not be included in HOV numbers. It is specious to suggest that a one mile ride in a shuttle van or bus from the parking lot to the airport constitutes HOV commuting. Such a perspective could conceivably allow for reports of increased employee HOV use while the 7,100 on-airport employee

spaces and a substantial increase in employee parking in areas surrounding the airport would allow for ample, unconstrained single occupant vehicle (SOV) commuting.

We have not asked for an increase in the HOV mode share goal of 35.2 percent at 37.5 million passengers but it is tempting when we see both passenger and employee trips counted under the HOV category that truly do not meet the criteria for such a designation. This would certainly seem to work against the goals of the Transportation Management Association (TMA). Ridership levels should distinguish between employees who utilize an HOV for only part of their trip to work and those who use an HOV for the entire commute. A distinction must also be made between carpoolers and drop-off/pick-ups.

Once again, use of the Massachusetts Bay Transportation Authority's (MBTA) Blue Line by air passengers is down. We believe that this number can be increased through education and marketing to air passengers. Unfortunately, Massport and the MBTA have been discussing the trial installation of a token machine in Terminal C for more than two years now. The GEIR should contain a detailed explanation as to why this subject has not moved beyond the discussion stage. As we have said before, token machines should be available in a highly visible location at every terminal along with subway maps and bus and subway schedule information. We suggest that Massport consider locating token machines and informational displays at shuttle bus stops.

The Update indicates that TMA membership is now 20% of all airport employees and that one TMA member is offering subsidized MBTA passes. How many employees are TMA members? How many employees receive a T pass subsidy? Why does the TMA estimate that a reduction of only 250 to 300 employee commuter vehicle trips may be a result of Transportation Demand Management (TDM) measures?

We are concerned that Massport is sending some mixed messages to air passengers about travel to Logan. Recent radio advertising stressed the number of parking spaces available with the garage opening but did not also note that there are many other ways to reach Logan. Also, a local newspaper and the Wall Street Journal reported several months ago Massport's plan to provide automobile repair and detailing services to air passengers who drive to the airport. This would seem to indicate a disconnect in planning on some level.

Laurence G. Hanscom Field and Regional Airports

Why is there no air cargo service to and from Hanscom Field? While the Update mentions developing a plan that satisfies the needs of Hanscom, there is no discussion of Boston's need for the use of Hanscom. And, again, Massport makes no effort to address the issue of offering incentives to airlines to operate scheduled passenger flights at Hanscom.

We agree with the suggestion of the BTD that cargo flight distribution be examined from a regional perspective in order to ease the burden on Logan.

Health

The issue of Logan and health related impacts continues to be a prevailing concern of this department and inhabitants of neighborhoods adjacent to and affected by Logan. Residents continue to question the potential tie between individual and cumulative airport impacts and cancer, respiratory illness, hearing damage, headaches, emotional distress, neurological complaints, violence and stress-related disorders. We once again ask for a literature search to be reported in the next GEIR.

Land Use

The design of landscaping for the relocated Park n Fly should provide an effective visual buffer for the community. Replacement sites for the gas station, ground service equipment facility, hanger support facility and cargo facility should be chosen so that they shield the community, reduce existing impacts and create no new impacts.

Noise

While the 1997 cumulative noise index fell by .3 EPNdB, the population within L_{dn} contours greater than or equal to 65dBA grew by 5,995, a 29 percent increase. Increased noise levels were experienced in East Boston and South Boston and calls to the Noise Complaint Line rose by 16 percent, from 3,913 in 1996 to 4,663 in 1997. This expansion of noise contours is disturbing and, it would appear, is partially the result of continuing problems with Runway 27 and the lack of success in reaching Preferential Runway Advisory System (PRAS) goals. We believe that actual operations of Stage 2 aircraft between 11:00 p.m. and 7:00 a.m. (due to unscheduled delays and necessary equipment substitution) may have contributed to this increase. However, despite prior requests, we have not succeeded in getting Massport to provide data on the number of Stage 2 aircraft arriving or departing annually between 11:00 p.m. and 7:00 a.m. We have also been unable to determine how often nighttime runway restrictions and late-night over-water flight operations were actually accomplished in a given year. We understand from the Update that NOMS data, referenced at 3.20 in Responses to Comments, will provide such information. This should be fully reported in the GEIR, providing information about actual, rather than scheduled, flights.

Please note that, given the increased noise contours and decisions to guide flight paths over urban open and recreational space, this department considers the increased use of Hanscom Field part of a comprehensive effort to equitably distribute noise (page 5-35).

How does the designation of the Harbor Islands National Recreation Area change the way Massport will analyze noise impacts? There will be increased use of the islands for camping and other recreational activities that will be adversely affected by overflights.

This department supports Massport's initiation of a study of the Hill Effect. We hope that this study will help to change the requirement that a resident must experience a flyover for soundproofing eligibility. The existing criteria leave many Boston residents subject to oppressive noise without mitigation.

We encourage Massport to advocate that the FAA include low frequency noise in its criteria for residential mitigation.

Southwest Service Area

East Boston residents do not agree with Massport's assertion that most users of the Maverick Gate are actually East Boston residents with a sticker. This remains an issue. Again, we ask that signage be installed to warn non-authorized vehicles that they will not find an exit on this route.

Please note that a hotel has been proposed for an area very close to this part of Logan. The potential impacts on hotel guests must be considered as development planning for the SWSA continue.

Water Quality

Staff of the Boston Conservation Commission (BCC) find that Massport rates its NPDES compliance with statements that are somewhat confusing and misleading. Descriptions such as "near full" to quantify the level of compliance is not specific or helpful. The GEIR should contain precise language that provides clear compliance information.

Massport plans to connect the Porter Street Drainage Area to the West Outfall during period of low flow. The existing treatment at Porter Street is already in complete compliance with NPDES levels for oil, grease and pH. What is the rationale for connecting Porter Street to this outfall? Won't the facility be overburdened by additional flow? We suggest that Massport use funds designated for the Porter Street connection be used to bring the West and North outfalls into complete compliance.

The Update notes that Massport audits its own and tenant facilities periodically for environmental compliance. Does this auditing involve enforcement and penalties?

We hope that Massport will find it appropriate to help educate the public and further improve the water quality of Boston Harbor by permanently installing at all storm drains plaques that bear the warning "Don't Dump - Drains to Boston Harbor." The enclosed guidelines contain information on obtaining these plaques.

Thank you for the opportunity to offer comment.

Sincerely,

Patricia A. Malone

Attention: Arthur Pugsley - MEPA Unit

Re: EOEA #3247/5146 - Boston Logan International Airport
1996 Annual Update

Dear Secretary Coxe:

The City of Boston Environment Department has reviewed the above referenced 1996 Annual Update (Update) and hereby submits the following comments.

Air Quality

We support Massport's efforts to provide an incentive to tenants to use alternative-fueled vehicles.

We restate our concern that Massport continues to examine the possibility of moving bus servicing and other operations to off-airport locations. This issue must be discussed with the community and information provided to the community and reviewers regarding the number of vehicle trips this would add to current levels.

We continue to understand from East Boston residents that vehicles waiting the in the taxi pool do not comply with MGL C. 90, Section 16A and 310 CMR 7.11, laws that prohibit vehicles in Massachusetts from idling for more than five (5) minutes unless the engine is required to operate lifts or refrigeration units. Massport indicates in response to our comment coded 4.4 that the problem of taxicab drivers trying to stay warm in their idling vehicles has been addressed. How?

Again, we ask that permanent signs be posted at all service areas, loading docks, the Bus/Limo Pool and other areas where vehicles are likely to idle advising vehicle drivers of the law and Massport's expectation of compliance.

Airside Improvements

While we understand Massport's position that the airside improvements project soon to be filed with MEPA is necessary to reduce delay, increase efficiency and improve airfield safety. We fail to understand why Massport continually refuses to disclose the passenger and operations capacity that would be possible at Logan if the Airside Improvements project was to proceed. This should be a detailed component of environmental filings on the proposal. We reserve further comment until we have had an opportunity to review the proposal in detail.

Community Response

Has the nature of the noise and odor complaint line changed so that a response to noise complaints, such as those from nighttime construction, are not addressed until the next business day?

Energy and Resource Conservation, Waste Reduction and Recycling

Again, this department requests that Massport and its tenants plan, design and operate new and improved facilities consistent with the concept of "*sustainability*." Building design should maximize the use of natural light, interior lighting systems should respond to fluctuations in ambient light and the potential for use of passive solar energy for heat and light should be evaluated for each new or renovated structure. Energy efficient heating and HVAC systems should be installed, regardless of who is paying the utility bill, and plumbing fixtures should include low-flow toilets and faucets with water conserving aerators. Some rooftop air conditioning units with electric cooling and gas-fired heating are equipped for hot air bypass for reheat of supply air, have dual path systems for separate conditioning of outdoor and return air streams and utilize outdoor air for cooling under suitable ambient conditions. The Federal Environmental Protection Agency's (EPA) "Green Lights" and "Energy Star" programs can provide additional information on environmentally sustainable and economically profitable measures. The address for these programs is 401 M Street, SW, Washington, DC 20460. The Energy Star fax line system can be reached at 202-233-9659 and the Green Lights/Energy Star Hotline is available at 1-888-782-7937 (fax 202-775-6680). A free subscription to the Green Lights & Energy Star Buildings Update can be ordered through the toll-free hotline number. Related Websites are: **http://www.epa.gov/greenlights.html** and **http://www.epa.gov/appdstar/buildings/**. We suggest that Massport use the EPA as a resource for itself and tenants.

We encourage Massport to provide close oversight on these issues, provide substantial direction to tenants and require as a standard part of construction contracts that contractors recycle or reuse, on-site or off-site, construction debris to the maximum extent possible. Some material not appropriate for reuse may be suitable for donation to The Building Materials Resource Center (100 Terrace Street, Roxbury, 02120, 617-442-8197). The Guide to Tenant Construction should include specific requirements for conservation and sustainability as well as sections regarding construction worker transit, approved truck routes and sanctions for route violations. In addition, Massport should consider the development of incentives for tenants to use environmentally sustainable practices.

Again, we request that future GEIRs and Annual Updates contain distinct sections devoted to the issues of energy and resource conservation, waste reduction and recycling.

Ground Transportation

The Update notes numerous times Massport's conclusion that non-airport related traffic using the Ted Williams Tunnel is responsible for the increase in Average Weekday Traffic (AWDT) and Vehicle Miles Traveled (VMT). While we understand that increased use of the tunnel may be a contributing factor, we believe that the Update understates the relationship of 'First Hour Free' parking, a policy in effect during eight months in 1996.

While the Logan Express high occupancy vehicle (HOV) service for passengers and employees has been a particular success, the same cannot be said for air passenger use of the

Massachusetts Bay Transportation Authority's (MBTA) Blue Line. As we have said before, token machines should be available in a highly visible location at every terminal along with subway maps and bus and subway schedule information. Massport continues to reply that there will be a trial installation of a token machine at Terminal C. This trial was mentioned in the 1994-95 Generic Environmental Impact Report (GEIR) (filed by Massport in July 1996) and was reportedly held up as a result of damage to token machines from the October 1996 flooding. Thirteen (13) months later a token machine is still not installed at Terminal C and 1996 activity in this regard is listed as "planning" for installation. When will this extended planning result in the actual installation of a token machine?

The Update indicates that there are presently 700 registered private bus, van and limousine operators providing private High Occupancy Vehicle (HOV) transit to the airport from areas underserved by convenient HOV services. It is estimated that these services may reduce trips to Logan by 4,500-5,000. No distinction is made between scheduled and unscheduled service. On page 5-36 single party transportation by an unscheduled commercial provider is considered an HOV service. We disagree. A means of transit should not be considered high occupancy unless there are three or more air passengers in the vehicle. A private, on-demand service that transports Logan one passenger to Logan is not an HOV. Future air passenger surveys, information asked of registered providers and Transportation Services Unit statistics should distinguish between the use of vehicles containing less than three air passengers and those containing three or more air passengers (true HOVs). Current and projected mode share statistics should then be modified as necessary to reflect the difference.

We are not convinced, as stated on page 5-39, that "Massport will not be in a position to revisit its passenger HOV mode share until well into the next decade when the airport and its access systems have stabilized."

We continue to support the consolidation of rental car services into one on-airport facility.

From a regional transit and air quality perspective, shuttling to the airport employees who have driven to parking lots from Chelsea and Revere in single occupant vehicles should not count as HOV use. Ridership levels should distinguish between employees who utilize an HOV for only part of their trip to work and those who use an HOV for the entire commute. A distinction must also be made between carpoolers and drop-off/pick-ups (see the "Other" category under HOV/Alternative Modes in Table 5-20, Employee HOV Mode Share).

Health

This issue continues to be a prevailing concern of inhabitants of neighborhoods adjacent to Logan. Residents have questioned the potential tie between individual and cumulative airport impacts and cancer, respiratory illness, hearing damage, headaches, emotional distress, neurological complaints, violence and stress-related disorders. We again encourage Massport to make a commitment to not only work with residents and local and state health agencies to develop a scope and procedure for study but to fund the chosen process. We believe that a good start would be a literature search to be reported in the next Annual Update.

Noise

The Annual Update provides no explanation for the problems in effectively implementing the Runway 27 jet departure procedures. Also, PRAS statistics show an uneven record and a substantial gap between goals and actual runway use.

References to the Noise Complaint Line fail to speak to nighttime construction noise complaints and how they are handled. Are they simply recorded, to be dealt with on the next business day?

How does Massport determine the level of compliance with the reduced engine idling recommendation?

Unfortunately, because a flyover is required for resident eligibility for soundproofing, many Boston residents are subject to oppressive noise without mitigation. In spite of Massport's noise rules for Logan, Stage 2 aircraft sometime land and take off between 11:00 PM and 7:00 AM due to unscheduled delays or the necessary substitution of equipment. In order to accurately and completely document the noise impacts of airport operations, the FAA flight strips collected from controllers each day should be used to determine the **actual**, rather than scheduled, number of nighttime flights into and out of the airport and the type of engine employed in each aircraft. This information should be provided in each Annual Update and GEIR.

Please note that we are concerned that noise impacts will increase if lower ceilings/visibility minimums are established.

Terminal A should be designed to shield the Jeffries Point neighborhood from noise impacts.

Regional Planning and Use of Regional Airports

Table 4-8 contains a list of Regional Planning Studies and implications of those studies for Logan. We find that the chosen implications for two of the cited studies do not fully represent the conclusions of the SMA and SAR that would affect Logan. The Second Major Airport Siting Study (SMA) was undertaken because the 1989 Massachusetts Airport System Plan (MASP) had concluded that even with operational and capacity improvements at Logan there would be a need for a second major airport by 2010. The SMA did not contain a specific recommendation about the type of airport necessary (international, short-haul or long-haul domestic). The Strategic Assessment Report (SAR) was based upon baseline assumptions that were different from the 1989 MASP and SMA, mainly regarding the future roles of communications and travel technologies. As stated in the document itself, the SAR was not meant to be a policy document nor was it designed to recommend a specific course of action. It did, however, conclude that the only necessary airport option, based upon projected demand, would be a large regional/reliever airport (LRRA). The SAR concluded that, given the many uncertainties in forecasting demand and mode type, a conservative risk posture would call for the landbanking of a potential site. Clearly the major discrepancies in these two planning documents must be reconciled. The lack of full accounting of implications and the noted discrepancies cause us concern about the usefulness of the *New England Regional Airports Passenger Service Study.*

Why have no regular carriers had success in serving Hanscom? The reasons for this lack of success should be outlined in the next Annual Update.

Water Quality

We hope that Massport will find it appropriate to help educate the public and further improve the water quality of Boston Harbor by permanently installing at all storm drains plaques that bear the warning "Don't Dump - Drains to Boston Harbor." This would be a very modest expense for Massport.

We request that, in the next Annual Update, Massport thoroughly compare the effects of potassium acetate and other deicing compounds that are more sensitive to the marine ecosystem than glycols.

It is encouraging to see Massport's attention to the large salt marsh system at Wood Island Bay. Currently, this major ecological resource has no official protection. Over the past several years, this department has advocated that Wood Island Bay Marsh be formally designated a conservation area. The next Annual Update should include a detailed discussion of why a conservation restriction is a threat to safety and security.

Clearly, a lack of attention by a fuel provider and customer allowed for the leakage of a very substantial amount of fuel. While this will not be a problem once the Jet Fuel Distribution project begins operating in 1999, we are believe that a mechanism for the detection of fuel leaks must be implemented immediately. It would seem that the fuel customer should have noticed a vast discrepancy between the amount of fuel for which they were billed and the amount actually used for operations. We request that Massport require that tenants adhere to a method of analysis that will detect a leak before it reaches the proportions reported in the Update.

Are all tenants co-signatories on Massport's NPDES permit?

Southwest Service Area

Airport Road (also known as Venice Street)is the sole access for traffic to the taxi pool and for trucks delivering automobiles to car rental agencies. This route abuts a residential area and the residents have noted the increased traffic, noise and odor. Signage should be installed to warn non-authorized vehicles that they will not find an exit on this route.

On a related topic, the Update includes only a brief reference to the Airport Edge Buffer Program. Is the Venice Street area included in this program? If not, Massport should begin a process with the community to identify an appropriate barrier or other mechanism to mitigate the effects of this trouble. We suggest that the redesign of this area take the needs of residents into account and locate access in egress in a place that does not cause such impacts.

Thank you for the opportunity to offer comment.

Sincerely,

Lorraine M. Downey
Director

Trudy Coxe, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, MA 02202
Attention: Arthur Pugsley - MEPA Unit

Re: EOEA #3247/5146 - Boston Logan International Airport
Generic Environmental Impact Report

Dear Secretary Coxe:

The City of Boston Environment Department has reviewed the above referenced Generic Environmental Impact Report (GEIR) and hereby submits the following comments.

Massport has requested that the GEIRs be filed every five years, rather then three, with Annual Updates to be filed by July 31 in years when a GEIR is not prepared. Massport did not file an Annual Update in 1994 and the 1995 Annual Update is a part of this GEIR. We oppose Massport's request at this time and believe that the three year schedule is appropriate given the history of filings and continuing work on the Central Artery/Tunnel and projects of Logan 2000.

Massport has also asked to be relieved of the requirement to file an ENF for new entrant airlines seeking to serve Logan, arguing that a GEIR and Annual Updates provide more meaningful data on overall operations. We do not agree and ask that this request be denied.

Air Quality

The GEIR indicates that while emissions of VOC and CO have decreased, (as has NO_x to a much lesser extent), these emissions are expected to rise in the future. With Stage 3 aircraft emitting significant amounts of NO_x and the projected increase in aircraft operations over time, this is a critical issue. Massport is to be commended for its program for conversion of its ground service vehicle fleet to alternative-fueled vehicles. Similar efforts by tenants must be strongly promoted by Massport. As an important step in mitigating the air quality impacts of Logan Airport, new lease agreements should include requirements or incentives, such as reduced curb fees for private fleet operators, for use of low or no emission vehicles by tenants. In addition, we believe that additional measures will be necessary and request that Massport investigate other

available technologies, particularly from Massachusetts-based companies, for reducing air emissions. Findings should be reported in the next Annual Update.

The GEIR indicates that Massport is evaluating the benefits of moving bus servicing and other operations to off-airport locations. The Annual Update should include a discussion of this issue, including the number of vehicle trips this would add to current levels.

It is our understanding from East Boston residents that vehicles waiting the in the taxi pool do not comply with MGL C. 90, Section 16A and 310 CMR 7.11, laws that prohibit vehicles in Massachusetts from idling for more than five (5) minutes unless the engine is required to operate lifts or refrigeration units. Massport should report on the level of compliance in the next Annual Update and, if the current organization of the taxi pool does not promote such compliance, efforts to ensure adherence to the law be detailed. Permanent signs should be posted at all service areas, loading docks and other areas where vehicles are likely to idle advising vehicle drivers of the law and Massport's expectation of compliance. In addition, the next Annual Update should include an analysis of potential additional odor impacts on residences near the taxi pool when the Post Office is demolished.

The issue of particulate emissions (PM) and their relationship to public health was a subject of discussion at the MEPA Scoping Session on August 27, 1996. Because aircraft and ground vehicles emit PM, we request that Massport initiate a monitoring program for $PM_{2.5}$ and PM_{10} to determine baseline levels and the manner in which they are distributed.

Massport is currently a contributor to the on-going South Boston air quality study being conducted by the Harvard School of Public Health on behalf of the South Boston Community Health Center. The study is gathering important information on various sources of air contaminants including apportioning sources of PM_{10} and $PM_{2.5}$. Funds for this study will soon run out and there is considerable value to the information being gathered. Massport, as well as other contributors, should continue to fund this monitoring program to build on the information gathered thus far.

The GEIR shows that a combination of ambient temperature, time of day, the type of aircraft operations, wind direction and runway use cause residents to file odor complaints with Massport. There is general agreement that such complaints are seriously under-reported by those affected. Community residents believe that there is a lack of widespread knowledge about how to file an odor complaint. Massport officials and their consultants note that there can be high levels of odor from very low concentrations of jet fuel. We recommend that Massport initiate a community education effort to inform residents of the way to file odor complaints. We also request that, with the Annual Update, Massport identify the ways in which odor impacts can be mitigated.

Airside Improvements

The GEIR contains minimal information on this consequential plan and it is noted that an Environmental Impact Report (EIR) will provide detail. At MEPA Scoping Sessions, public meetings and Massport-sponsored technical sessions it has been consistently stated that Runway 14/32, a center taxiway and lower minimums are necessary for efficiency at existing passenger and operations levels and are not geared toward expansion of the airport. There is no reference in

the GEIR to the capacity that might be possible at Logan should Massport's preferred changes be implemented. Due to this lack of detail, we request that you require the Airside Improvements EIR to include an analysis of the potential for these improvements to increase the number of passengers that could be served and the number of new operations that Logan would be capable of sustaining. The impacts of this capacity should then be detailed for: air quality, particularly for levels of CO and NO_x, $PM_{2.5}$ and PM_{10}, and for odor and soot impacts; ground access and transportation, with potential HOV and public transportation mode shares, vehicle trip per passenger (VTPP) and vehicle miles traveled (VMT) expectations, anticipated employee transit characteristics and overall parking needs; noise, including the number of city residents living within the expected L_{dn} 60 dBA and L_{dn} 65 dBA contours and projected low frequency noise impacts; and water quality, especially related to projected fuel spills and deicing activities. The number of aircraft that could be queued on taxiways should be detailed.

Blast Fence

It is our understanding that Massport will be submitting an Environmental Notification Form (ENF) for removal of the blast fence across from the Orient Heights Yacht Club. There appear to be several significant issues surrounding this controversy and we begin by observing that the manner in which Massport informed the community of its intent to remove the fence has further reduced trust and may make community process on any project more contentious.

East Boston residents view the blast fence as a device that mitigates noise, fumes and blast effects from Runway 22R. Massport feels an obligation to take the fence down because it frangible, and would therefor present a hazard to flight personnel and air passengers in the event of a crash. Residents feel that Massport is only concerned with the well being of airline and airport personnel and air passengers and that removal of the fence will negatively affect yacht club members, recreational users of Constitution Beach and those who live in Orient Heights. It is easy to appreciate each perspective. While we have no desire to compromise the safety of air passengers or flight and ground personnel, we also wish to ensure that members of the public are protected from noise, fumes and the jet blast that may present a hazard to boaters. We request that the alternatives analysis for the ENF include the results of a detailed investigation of a non-frangible barrier and other methods to ensure that the quality of life in and adjacent to Orient Heights is not further degraded.

Energy and Resource Conservation, Waste Reduction and Recycling

This department requests that Massport and its tenants plan, design and operate new and improved facilities consistent with the concept of "*sustainability*." Building design should maximize the use of natural light, interior lighting systems should respond to fluctuations in ambient light and the potential for use of passive solar energy for heat and light should be evaluated for each new or renovated structure. Energy efficient heating and HVAC systems should be installed, regardless of who is paying the utility bill, and plumbing fixtures should include low-flow toilets and faucets with water conserving aerators. Some rooftop air conditioning units with electric cooling and gas-fired heating are equipped for hot air bypass for reheat of supply air, have dual path systems for separate conditioning of outdoor and return air

streams and utilize outdoor air for cooling under suitable ambient conditions. The Federal EPA's "Green Lights" program is a good source of information on energy conservation.

When drafting plans for landscaping, vegetation should be chosen that does not require extensive irrigation so that there is minimal use of potable water for this purpose.

One of the goals outlined in the City's 1996 Environmental Blueprint is to promote reduction, reuse and recycling of wastes. Items accepted for recycling by most recyclers include glass containers, metal containers, cardboard, newsprint, white paper, milk cartons, juice boxes and plastic containers designated from 1 to 7 and they can be co-mingled. All airport facilities should include space for the separation of recyclable items from trash and for the storage and pick-up of items. We suggest that Massport talk with staff from the Department of Public Works Recycling Program to discuss how airport-wide recycling can be made efficient and effective.

We encourage Massport to provide close oversight on these issues, provide substantial direction to tenants and require as a standard part of construction contracts that contractors recycle or reuse, on-site or off-site, construction debris to the maximum extent possible. Some material not appropriate for reuse may be suitable for donation to The Building Materials Resource Center (100 Terrace Street, Roxbury, 02120, 617-442-8197). The Guide to Tenant Construction should include specific requirements for conservation and sustainability as well as sections regarding construction worker transit, approved truck routes and sanctions for route violations. In addition, Massport should consider the development of incentives for tenants to use environmentally sustainable practices.

In an on-going effort to support the clean-up of Boston Harbor, we request the permanent installation of plaques at storm drains that bear the warning "Don't Dump - Drains to Boston Harbor." Information on these plaques is available at the Boston Water and Sewer Commission.

We request that future GEIRs and Annual Updates contain distinct sections devoted to the issues of energy and resource conservation, waste reduction and recycling.

Ground Transportation

We congratulate Massport for its commitment to employee demand management, evidenced by work to initiate a Transportation Management Association (TMA) and an East Boston shuttle service. As we have commented before, it is this department's strong belief that construction employees, abundant in number, should be affiliated with the TMA and that such a requirement be part of Massport's contract with construction firms. We hope that the next Annual Update will detail the incentives to join the TMA that Massport offers to tenants. In addition, an explanation should be offered regarding the recent service reductions by the on-airport #44 shuttle.

The planned consolidation and relocation of auto rental facilities and locations for park and fly lots should be thoroughly analyzed for a various potential locations with a goal to reduce impacts on residents of surrounding communities. We ask that the Annual Update contain a complete discussion and evaluation.

Some preliminary data on the "First Hour Free" parking program, aimed at reducing both curb use and the number of vehicles circling airport roadways while waiting to pick up passengers, show an increase in vehicle trips to Logan. Both Massport and area residents have noted that there was increased curb use when the one hour parking rate was increased from $4.00 to $5.00 in January 1996. Massport must substantiate, when filing supplemental information, the

claim that free parking causes no increased traffic generation and reduces curbside congestion. We also request, given Massport's willingness to forgo some parking revenue, that the supplemental information include an evaluation of reinstituting a charge for first hour parking with those revenues dedicated to trip reduction, congestion mitigation and open space development and maintenance in East Boston. Existing commitments and the funding of mitigation for approved projects should not be affected by any new sources of mitigation revenue. This evaluation would require examination of a range of first hour pricing options and calculations of the revenue generation by each.

Recognizing that Massport is attempting to address both safety and environmental issues regarding parking, area residents suggested several options at the August 29, 1996 Technical Session. They included a barrier toll at the airport entrance, rescission of the taxi surcharge and a pricing policy that makes the first hour the most expensive. These and other alternatives should be evaluated in the next "First Hour Free" filing.

Should Massport receive approval to continue with the "First Hour Free" policy, it seems sensible that they must reevaluate parking analyses for airport projects, including the West Garage, that are based on a substantially different pricing schedule.

While the Logan Express high occupancy vehicle (HOV) service for passengers and employees has been a particular success, the same cannot be said for air passenger use of the Massachusetts Bay Transportation Authority's (MBTA) Blue Line or buses from the North Shore. To increase awareness of public transit options, token machines should be available in a highly visible location at every terminal along with subway maps and bus and subway schedule information. Travelers should also be able to purchase the MBTA's short-term visitor transit passes at the airport. When Blue Line trains are expanded from four to six cars, one car on each train should be equipped with baggage racks or platforms and the MBTA should advertise this accommodation. Some MBTA buses from the North Shore will make a detour for Logan passengers at their request but this is not widely known and it increases trip time for commuters to downtown. The MBTA should examine use of Wood Island Station as a transfer point with Massport providing shuttle service for both employees and air passengers. Shuttles from Maverick Station should also be considered.

Another option for deliberation, particularly if the People Mover project does not go forward, may be extension of the Blue Line through the airport to Gloucester on an existing right of way (ROW) near the water tanks on the north side. Escalators and elevators at MBTA stations serving the airport and downtown are particularly important for travelers with luggage and a dedicated effort should be made to ensure that they are operable or re-started as quickly after a shut-down as safety permits. An air passenger who finds that they must carry bags up a long stairway because the escalator is not functioning is unlikely to use this mode again if they have other choices. Turnstile configuration at the same stations should be designed with slide-throughs or other ways for the comfortable movement of suitcases, other luggage, carts, strollers and parcels. Providing flight information screens and areas for luggage storage at major downtown subway stations should be examined as a method for decreasing inconvenience for air passengers who also choose public transit.

This department recognizes that increasing air passenger use of public transit will have impacts for the MBTA. We encourage Massport and the MBTA to work closely together to resolve any issues that may prevent a coordinated effort to educate air travelers about the availability of our public transit system and then making it convenient for them to use that system.

On a more broad-based level, we believe that accommodating the region's expected number of air passengers in the coming years will require a joint effort by municipal and state agencies to identify and provide a range of convenient and efficient intermodal transportation alternatives to Logan that do not impact local communities. As an example, parking facilities convenient to the Massachusetts Turnpike, perhaps in conjunction with other development efforts, might allow for increased Logan Express or other park and ride services for air passengers. It would seem that a formal, distinct, collective enterprise by Massport, the MBTA, Massachusetts Highway Department (MHD), Massachusetts Turnpike Authority (MTA), Boston Transportation Department (BTD) and other agencies involved in transportation and economic development may be key to creating a variety of solutions. We ask that you take any steps necessary to encourage this type of a collaborative effort.

Health

This issue is clearly a prevailing concern of inhabitants of neighborhoods adjacent to Logan. Residents have questioned the potential tie between individual and cumulative airport impacts and cancer, respiratory illness, hearing damage, headaches, emotional distress, neurological complaints, violence and stress-related disorders. It appears, from information gleaned at the September 16, 1996 Technical Session, that available discharge data is not a reliable indicator of possible connections between an airport and illness. Clearly, a methodology for examining potential links must be identified so that a proper response can be formulated. While we understand that Massport is not a public health agency, we believe that it is appropriate for Massport to fund a study on this matter. We encourage Massport to make a commitment to not only work with residents and local and state health agencies to develop a scope and procedure for study but to fund the chosen process.

Noise

The number of Boston residents living in the L_{dn} 60 dBA and L_{dn} 65 dBA contours have increased despite the modest decrease in the Cumulative Noise Index (CNI). This clearly indicates that a more comprehensive mitigation program is necessary. The Annual Update should explain in detail why the collective use of Runway 15R/33L is not more frequent and how enhanced PRAS has or has not assisted in meeting PRAS goals.

Volume II (pages II-2-72/73) contains a discussion of reduced engine-taxi and concludes that there is a net reduction in cumulative noise when one or more aircraft engines are shut down during taxi operations. We request that this change be implemented as part of the overall noise abatement strategy.

The GEIR reports that the Low Frequency Noise Study showed that Massport's noise insulation program mitigates this impact. It is also noted that "the human perception threshold of

vibration ... is far below the vibration level needed to initiate surface cracking in structures." (Volume IV, Section 4.4.) There is however, no reference to the way in which vibration may affect the health and quality of life of residents exposed to his impact. This aspect of vibration must be examined.

Why were no wide-body aircraft included in the study when Massport is adding gates specifically designed to accommodate such airplanes? Given their absence, we question the validity and applicability of the conclusions and request that the low frequency noise effects of wide-bodied aircraft be studied. This is an issue that needs further investigation and Massport should continue research to identify any mitigation standards that have been set for this impact at other airports. Of particular concern for us are residents of neighborhoods like Jeffries Point who are not eligible for soundproofing but who are subject to considerable low frequency noise.

As staff from this department experienced on August 8, 1996 at a meeting at the Orient Heights Yacht Club, the noise level in the area is overwhelming. We understand from residents that the number of idling aircraft queued on the north taxiway contributes to the din. The Annual Update should include a discussion of ways to minimize the queue and resulting noise.

The GEIR indicates that Massport fields many telephone complaints annually and that information is forwarded to the Federal Aviation Administration (FAA). What appears to be missing from the description is the frequency and manner in which exceedance data is provide to the airlines. We recommend that such information be provided directly to each airline on a frequent, regular basis. The process for doing so should be specified in the Annual Update as should a clear reporting of exceedances, including single events.

Although directed to analyze the noise from helicopters flying to and from Logan, Massport has only reiterated information previously provided. The Annual Update should include an evaluation of the impacts of the described routes and the options for mitigation.

During a discussion of the Flight Track Monitoring Study at the September 20, 1996 Technical Session, community residents noted that low altitude operations are a nuisance and violate Massport's standards. The Annual Update should contain a method for factoring low altitude operations into flight track monitoring data.

Water Quality

Massport has demonstrated increasing attention to the impacts of airport operations on water quality in and around Logan. The support of best management practices and performance of environmental audits demonstrate a commitment to protection of ground and Harbor waters. This department is encouraged by the improved compliance with NPDES permits for oil, grease and pH (Tables II-5-7 and 5-8). Yet, stormwater runoff, deicing chemicals, and fuel spills continue to be potential sources of contamination for Boston Harbor and the ecologically important marshes that are a habitat for migrating water fowl and a breeding area for fish and fowl.

While recognizing the necessity of deicing for safe operations, we are concerned about its impacts. Although the compounds are not persistent in the environment, the GEIR does not provide information on the implications for the marine ecosystem due to short term and steady exposure. We recommend that Massport move away from the use of ethylene glycol and toward

the use of propylene glycol with a goal to ban the use of ethylene glycol at Logan within several years. If most of the glycol is used in a known location, i.e. on the aprons, planning efforts should be made to find a way to collect and dispose the used product before it enters the drainage system, collect and treat the fluid before release or to reuse collected glycol. This department requested in 1993 that Massport investigate the feasibility of installing catch basins/holding tanks for glycol in the apron areas and there has been no response. We request that, in the Annual Update, Massport respond to this request and thoroughly compare the effects of potassium acetate and other deicing compounds that are more sensitive to the marine ecosystem.

It is encouraging to see Massport's attention to the large salt marsh system at Wood Island Bay. Currently, this major ecological resource has no official protection. Over the past several years, this department has advocated that Wood Island Bay Marsh be formally designated a conservation area. The GEIR suggests that a formal designation is now feasible. The Boston Conservation Commission (BCC) requests that Massport initiate this process. The GEIR mentions planning for open space buffers. We applaud Massport's commitment to a community design process and request that plans for the East Boston Greenway be considered as part of the overall context. A boardwalk system through the marsh, for example, would connect pieces of the Greenway and provide opportunities for citizens to learn about the ecosystem. Massport has demonstrated an interest in education by allowing access to this area in the past for environmental education programs run by the Boston Natural Areas Fund (BNAF). We encourage continued efforts and offer our assistance in finding ways to open this major environmental resource to the public.

The GEIR contains numerous references to the limits of Massport's influence on changes in service, with the role of airport operators and transportation professionals described as subordinate to that of airlines. Notably missing from this description is the function of Massport's marketing staff in attracting new and expanded service. The representation is self-serving and understates the effect of policies and practices that may contribute to limited use of other airports. For example, Massport has imposed noise rules at Laurance G. Hanscom Field that effectively limits the size of aircraft flying to and from Bedford. In addition, there has been no investment in terminal space and passenger services and it is reasonable to conclude that Massport is acting to prevent this facility from being suitable and attractive for expanded service. This suggests to us that Massport is willing to inflict substantial impacts on urban residents but is unwilling to distribute some of those impacts to communities whose residents fly in and out of Logan. We believe that Boston residents have borne more than their share of airport-related difficulties and it is time they be shared.

In discussing the issue of expanded service at Logan or other facilities, including regional airports, the GEIR asserts that Logan Airport's location reinforces urban land use patterns and supports the economy and development in the downtown area (I-5-36). Growth and development of regional airports, it is suggested, will contribute to urban sprawl. Further, the reader is asked to consider that there is no such thing as an "impact-free choice" when trying to determine how to meet the need for increased air travel. Logan is identified as "uniquely well-

served in comparison to the regional airports by the highway, public transportation, and HOV services which help minimize the adverse environmental impacts of growth." Maximizing the use of regional airports is not thought to be necessarily "better" from an environmental perspective because of the potential for such consequences as increased traffic, poor levels of service at key intersections and possible secondary impacts to local street networks.

Residents of neighborhoods adjacent to Logan fully appreciate the impacts of a nearby airport. In fact, these neighborhoods today live with an overabundance of airport-related impacts. From our perspective, deliberations about the path to expanded air service must recognize this reality. Such a planning process must also resolve the major inconsistencies between the Massachusetts Aeronautics Commission (MAC) 1990 Second Major Airport Study (SMA) and the 1993 Strategic Assessment Report (SAR) regarding Logan's present capacity, future demand for air travel, the relative influence of telecommunications technologies and other travel modes on air travel demand and methods for ensuring continued, sufficient air service to the region. In any case, both studies acknowledge the need for service growth beyond Logan Airport. We note with concern that there has apparently been no action on recommendations from either the SMA or SAR.

While we recognize that Logan is expected to expand, it has reached the maximum level of local impact that the City of Boston and surrounding neighborhoods are willing or able to accept. As such, other airports must be prepared to expand or Logan will have to curtail its growth.

Thank you for the opportunity to offer comment. We look forward to the next Annual Update.

Sincerely,

Lorraine M. Downey

Dear Peter:

In accordance with our telephone conversation today regarding your public records request dated September 12, 1996, I have enclosed the "Agreement between The Federal Aviation Administration and The City of Boston and the Massachusetts Port Authority" (No. L-1950).

If after reading it you need additional documents, please call me at 973-5653.

Sincerely,

MASSACHUSETTS PORT AUTHORITY

Ira M. Wallach
Senior Legal Counsel

AGREEMENT

between

THE FEDERAL AVIATION ADMINISTRATION

and

THE CITY OF BOSTON

and

THE MASSACHUSETTS PORT AUTHORITY

MPA Ref. No. L-1950

THIS AGREEMENT made as of this 31st day of July, 1980 between the FEDERAL AVIATION ADMINISTRATION (hereinafter, the "FAA"), an agency of the Department of Transportation of the United States of America, the CITY OF BOSTON (hereinafter, the "City"), a municipal corporation chartered by the Commonwealth of Massachusetts, and the MASSACHUSETTS PORT AUTHORITY (hereinafter, the "Authority"), a body politic and corporate organized and existing pursuant to Massachusetts St. 1956, c. 465 as amended:

WITNESSETH:

WHEREAS, FAA desires in conjunction with Authority to install certain navigational facilities on premises leased at Boston-Logan International Airport ("Airport") for the aid and assistance of aircraft preparing to land on Runway 15R at the Airport, which facilities are specifically:

1. A 1,400 foot-long Medium Intensity Approach Light System with Flashers, more commonly referred to as a MALS/F;

2. A 3,000 foot-long Touch Down Zone Lighting System (This system to be installed and operated by the Massachusetts Port Authority).

3. A relocation of the present Localizer System from an offset configuration to a centerline configuration which will be physically located on the Runway 33L pier but will serve Runway 15R.

WHEREAS, the City is concerned that features of the foregoing proposed installations may have the potential to raise significant environmental issues about increased noise annoyance for residents of the City living under the aircraft approach path to Runway 15R, particularly about increased aircraft arrival traffic on Runway 15R in periods of poor weather and at night.

WHEREAS, FAA, in a project notification form on the proposed installation prepared pursuant to Office of Management and Budget Circular A-95, has stated that FAA's intention is not to lower landing minimums on Runway 15R as a result of the proposed installations (a copy of the background information presented by FAA in support of the project notification is attached hereto as Exhibit A and incorporated by reference herein).

WHEREAS, the City has the right to oppose the proposed installations and so advise FAA and Authority, thereby having the potential for delaying or preventing their implementation.

NOW THEREFORE, for and in consideration of the premises and covenants, terms and condition hereinafter set forth, the City, the FAA and the Authority do hereby mutually agree as follows:

1. The City shall refrain from exercising its right to oppose the proposed installations.

2. FAA will not reduce the landing minimums for Runway 15R as a result of these installations from those existing prior thereto. Specifically, these minimums are a decision height of 268 ft. MSL and a visibility of 4,000 ft. as measured by the airport RVR system or three-quarters of a mile measured as the prevailing visibility.

3. If at any time in the future, for any reason, FAA desires to pursue lower landing minimums to Runway 15R not as a result of these installations, the FAA will be required to prepare a full environmental impact statement including public meetings if so desired by any community group or other interested party.

4. FAA agrees that the terms of this Agreement will be included in all leases associated with the navigational aids involved in these proposed installations, by inclusion of terms in said leases substantially as set forth as Exhibit B which is attached hereto and incorporated by reference herein.

5. Authority shall monitor the volume of landing traffic on Runway 15R in accordance with currently established runway use data collection procedures and will

report periodically to the City the changes, if any, in the volume of traffic on Runway 15R.

6. This Agreement may not be amended except in a writing duly signed by all parties.

7. This Agreement shall be deemed a Massachusetts contract to be governed by and construed under the laws of the Commonwealth.

IN WITNESS WHEREOF, the parties have caused counterpart originals of this Agreement to be executed by their duly authorized representatives as of the date first above written.

I. BACKGROUND

The FAA and MPA have been conducting studies of various facility modifications and improvements aimed at enhancing the overall airport environment at Logan International Airport. The thrust of these studies has been an attempt to achieve the best possible balance between community needs and concerns on the one hand, and improvements to the operational environment on the other. Both have considered the safety of people, both in the air and on the ground, as the primary factor, with no derogation of safety permitted. It was concluded that there were numerous actions that could be taken which would improve community, operational, and safety factors at Logan, some of which have already been implemented. Those actions pertaining to Runway 15R are considered of next highest priority and are the subject of this proposal.

The overall objective of this proposal is to improve the approach and landing environment to Runway 15R by enhancing the electronic precision and visual aids available to the pilot of landing aircraft. The intent is to achieve greater consistency in completion of the approach to touchdown, and to thereby greatly reduce the high incidence of missed approaches which have occurred on this runway in the past without the benefit of these improvements.

Landing approaches to Runway 15R under low visibility conditions have historically produced a far greater number of missed approaches than on any other runway. It is also the only runway approach where large numbers of consecutive missed approaches have occurred. The missed approach problem has subjected the residents under the final approach path to an unnecessary number of severe noise events.

In addition to the clear need to address the missed approach problem at its source, there is also a need for a continuing phased program to upgrade navigational aids available at Logan, and to provide approach lighting guidance for all air carrier landing runways. This proposal is one element of that program.

II. PROPOSED ACTIONS

The FAA, in conjunction with the Massachusetts Port Authority, proposes to improve the existing Runway 15R approach and landing environment at Logan Airport by taking the following specific actions:

1. Install a short medium intensity approach light system with sequenced flashers (MALS/F) extending 1,400 feet toward the northwest from the displaced landing threshold. The MALS/F system would be flush mounted in existing lighting cans previously installed in the displaced runway and blast pad pavement, and with new paved pads constructed in the grass overrun for installation of the last two light bars of the system. The nearest light bar to the airport property boundary would be 1,400 feet away. (See exhibits 2, 5, and 6 for location and further details.)

2. Install a touchdown zone lighting system extending from the displaced landing threshold toward the southeast for a distance of 3,000 feet. The lighting cans and conduit for this system were installed in the runway pavement several years ago. Activation of the system requires only the installation of the flush mounted lighting fixtures, installation of interconnecting cable, and certain lighting vault modifications. (See exhibits 2, 7, and 8 for location and further details.)

3. Relocate the present Localizer component of the instrument landing system (ILS) from its present offset position beside the runway to a centerline position on the approach light pier to Runway 33L. This relocation will require the construction of a new Localizer antenna platform on the pier, a new pile supported platform 250 feet to one side of the pier for the electronic equipment shelter, and a walkway connecting the two.

4. Relocate the present visual glide slope indicator (VASI) approximately 100 feet toward the southeast so that its visual glide slope is coincident with the existing electronic glide slope. (See exhibit 2.)

III. OTHER CONCURRENT ACTIONS

The Massachusetts Port Authority is also proposing other concurrent improvement and rehabilitation actions on airfield areas at Logan Airport this construction season which are the subject of a separate "Notice of Intent", filed by that agency under OMB Circular A-95 procedures on February 28, 1980.

IV. BENEFITS/RESULTS EXPECTED

The primary benefits of this proposal will be an enhancement of the runway environment which will produce a reduced potential for missed approaches, thereby eliminating the noise events produced under the path of those missed approaches, and an overall improvement in the precision, standardization, and margins of operational safety associated with landings on Runway 15R.

Specific benefits of the individual elements of the proposed program are as follows:

1. Installation of the MALS/F approach light system and touchdown zone lighting will greatly enhance a pilot's ability to gain visual contact with the runway environment well before reaching the existing decision height of 268 feet, at which point a missed approach must be executed if that environment is not clearly established visually. This is the primary element which will insure that a landing can be completed rather than a missed approach being executed.

2. Centering of the Localizer will eliminate this non-standard aspect of the ILS approach and the last minute course correction required for alignment with the runway. The centering will also enhance a pilot's ability to complete a transition from instrument flight to visual contact with the runway environment before reaching decision height.

3. Relocation of the existing VASI will eliminate a non-standard condition resulting from the fact that it was installed by the Massachusetts Port Authority prior to the installation of the existing ILS system by the FAA. As a result, its projected glide slope for visual approaches is not coincident with the ILS glide slope. Relocation will make both glide slopes coincident and move the VASI touchdown point slightly more than 100 feet further from the community, raising the altitude of that glide slope by about 6 feet.

...IDERATION OF PROPOSED ACTIONS

1. GENERATION OF INCREASED LANDING TRAFFIC

The proposed improvements to the Runway 15R approach and landing environment will not result in increased use of Runway 15R for landing. Assignment of runways for landing is made by the FAA in accordance with the preferential runway use system which gives Runway 15R the lowest landing priority. Other factors which must be considered in the assignment process include wind direction and velocity, runway surface condition, visibility and the capacity of the selected landing and takeoff runway combination to accommodate the anticipated volume of arriving and departing traffic without unacceptable delays. These runway assignment procedures will not change as a result of the actions proposed and have historically resulted in very low utilization of Runway 15R for landing. For five of the past six years, an average of only 4½ per cent of all landings have used Runway 15R. By comparison, if landings were assigned so as to equally distribute them between each of the five instrumented landing runways ends, the utilization of each would be 20 per cent. This serves to demonstrate the effectiveness of the preferential runway assignment practices employed by FAA in keeping the landing use of Runway 15R to a minimum. These practices will continue.

Since there will be no change in the landing utilization of Runway 15R as a result of the proposed actions, there can be no noise or air quality impacts thereby generated. The proposed actions are expected to greatly reduce if not eliminate missed approaches, and the additional landing attempts which usually occur after missed approaches have been executed.

2. LANDING MINIMUMS

The present landing minimums on Runway 15R will not be altered as a result of the actions proposed. Present landing minimums on Runway 15R are a decision height of 268 feet above sea level and a forward visibility of 4,000 feet, as measured by the Runway Visual Range (RVR) instrumentation in the touchdown area. These minimums will be retained upon completion of the proposed improvements.

3. LIGHTING EMISSIONS

a. MALS/F Approach Lighting System

Characteristics and location of the proposed MALS/F approach lighting system components are described in Exhibits 2, 5 and 6. and differ from the normal MALSF installation in that the lighting fixtures are recessed flush in the pavement rather than being elevated on stems above ground level. The light beams of the recessed fixtures are aimed upward toward the approach area at an angle of 5° to the horizontal by passing through a prism in the slotted fixture top. This produces sharper horizontal and vertical cut off angles than the elevated fixtures with no greater light intensity.

Light levels along the extended path of the MALSF system will be increased but only during those minimal periods when Runway 15R is in use for landings at night or under low visibility conditions. Since the light beams are aimed upwards to provide maximum brightness along the glide path and have a sharp vertical cut off angle, the increased illumination near the ground will be quite small. The illumination also falls off rapidly with distance and with increasing angles off the centerline.

In 1978, an environmental impact study of elevated MALS approach lighting systems was conducted by H. H. Aerospace Design Co. Inc. of Bedford, MA under contract to the FAA. This study produced a computer model capable of accurately estimating illuminance levels which would be produced at any point in the approach environment. Using this methodology, it has been calculated that worst case illuminance levels on Neptune Road would not exceed .05 foot candles. This value is compared to other common sources below:

Fluorescent Illumination in Kitchen	43.0 foot candles
Incandescent Light Suitable for Reading	15.0 " "
Beneath Mercury Vapor Street Lamp	1.3 " "
21" Color TV at Distance of 10 Feet	.3 " "
Full Moonlight	.02 " "

The sequenced flashing lights were also evaluated in the study with respect to their contribution to illumination levels. The study concluded that "The flashing illumination from the strobes in a MALS/F system falls off more rapidly than the steady illumination as one moves out from the airport. As soon as one is more than 100' beyond the last flasher, the flickering light is less than the constant light."

In the case of Neptune Road, none of the direct illumination of MALSF lights would be visible from ground level although in a few homes unshielded by trees or other buildings, they could be seen from upper story windows, as can other existing airport lighting. The fact that the direct illumination MALSF lights would not be visible near ground level was confirmed last year when FAA installed a sample light bar at the station which would be nearest the community for demonstration purposes.

Sometime in April 1980 the new MALS/F system installed in the displaced runway pavement to Runway 22L should become operational. This will provide an opportunity to view an identical system from the Bayswater shoreline and from a distance closely approximating that which would exist between Neptune Road and the proposed Runway 15R MALS/F system.

b. Touchdown Zone Lighting System (TDZ)

The characteristics and location of the proposed TDZ lighting system are described in Exhibits 2, 7 and 8. Due to its distance from the nearest community, the light emissions of this system are not anticipated to produce any incremental impact over that associated with the MALS/F system.

4. LOCATION OF SECOND CATEGORY II SYSTEM

A Category II instrument landing system was proposed for installation on Runway 15R. This is no longer contemplated. If a second Category II system is designated for Logan International Airport, it will be installed on Runway 33L.

5. CONSTRUCTION IMPACT

From a construction impact standpoint, no significant construction related annoyances should be created. The only noise which should be discernable from construction operations would be that associated with pile driving over a two to three week period at the Runway 33L approach light pier. All other construction work should produce no adverse noise, air quality or water quality impacts whatever. Truck deliveries would be extremely limited, consisting primarily of electrical materials. All piles and timber materials would be delivered by barge. The Massachusetts Port Authority will be filing permit applications with appropriate Federal, state and local licensing agencies for this marine construction work.

VI. MITIGATING ACTIONS

In order to mitigate environmental concerns, the Federal Aviation Administration and the Massachusetts Port Authority propose to jointly give positive assurances with respect to certain elements of the proposed actions which may be perceived as having a potential for some adverse environmental effects. These are as follows:

1. Generation of Increased Landing Traffic

Should it be proposed at any time in the future to revise the existing Preferential Runway Use Procedures under which runway use assignments are made by the FAA, full environmental assessment will be prepared and filed in accordance with state and Federal environmental laws. Full opportunity for public participation will be provided in these processes.

2. Landing Minimums

The FAA will accept a restriction which the Massachusetts Port Authority will incorporate in the new or amended site leases which FAA must obtain from the airport proprietor for the centering of the localizer and the MALSF approach light system

for Runway 15R. This restriction will be identical to those contained in the site leases for the new ILS system on Runways 22L and 27 which require that FAA file an Environmental Impact Statement under the National Environmental Policy Act, should at any time in the future it proposes to lower the landing minimums on those runways. The restriction also requires that the Massachusetts Port Authority concurrently file an environmental impact report under Massachusetts environmental law.

3. Lighting Emissions

Should the light emissions from the lighting systems proposed for installation prove to be of significant annoyance to residents living in the approach to Runway 15R, all feasible shielding measures will be explored and available alternatives reviewed with these residents to determine the most appropriate method to be employed for mitigating that annoyance.

4. Location of Second Category II System

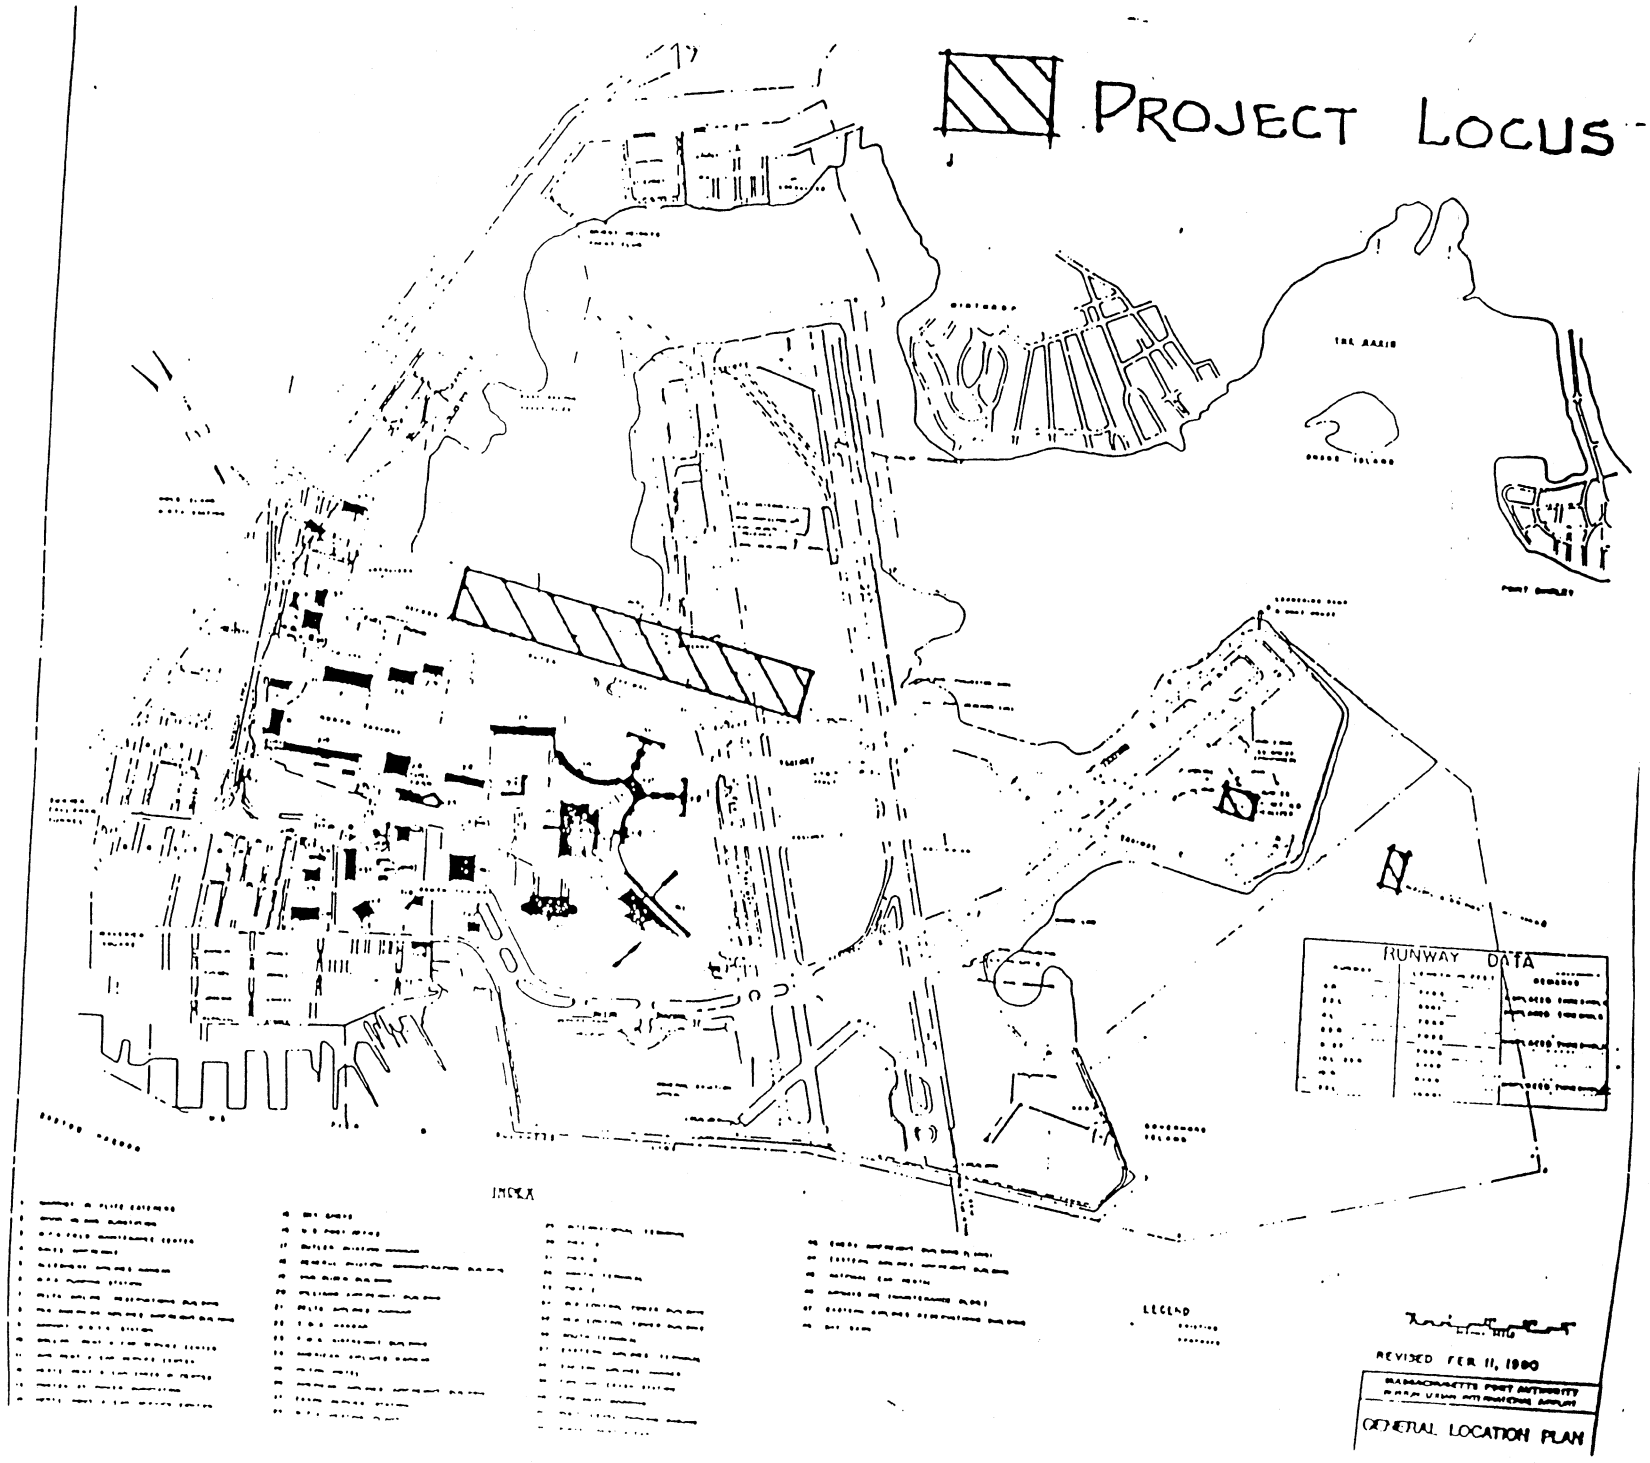
By vote of the Massachusetts Port Authority Board several years ago, Runways 4R and 33L are the only runways on which Category II systems are permitted by that agency. The Authority has recently made a formal request to the FAA that it designate Runway 33L as the second runway at Logan for Category II installation to enhance its use for overwater approaches. The FAA is currently evaluating this request.

VI. PROPOSED IMPLEMENTATION OF ACTIONS PROPOSED

It is proposed to accomplish the construction work necessary to implement these actions during the 1980 construction season.

VII. PROJECT COST

Total estimated cost of this project is approximately $800,000.



PROJECT LOCUS
RUNWAY DATA
INDEX
LEGEND
REVISED FEB 11, 1980
GENERAL LOCATION PLAN

Exhibit 1

Precision Instrument Approaches

1. General. The Instrument Landing System (ILS) is designed to provide pilots of properly equipped aircraft with precision electronic information for approach and landing. The system provides accurate vertical and lateral guidance to the runway. The ILS is the national standard precision system and is installed by FAA under its charter to foster safety in air commerce.

2. Description of ILS Components and Related Facilities Serving Runway 15R

   a. Localizer/Distance Measuring Equipment (DME).

   This facility which transmits lateral runway guidance information is presently installed as an offset facility. It is intended to relocate the system onto the Runway 33L approach light pier, approximately 1,000 feet from the Runway 33L landing threshold. Co-located with the localizer is distance measuring (DME) equipment which transmits to the pilot his distance to the runway touchdown point.

   b. Glide Slope.

   This facility transmits vertical guidance information from an on airport site which is adjacent to the runway touchdown point located approximately 1,000 southeasterly of the Runway 15R displaced landing threshold.

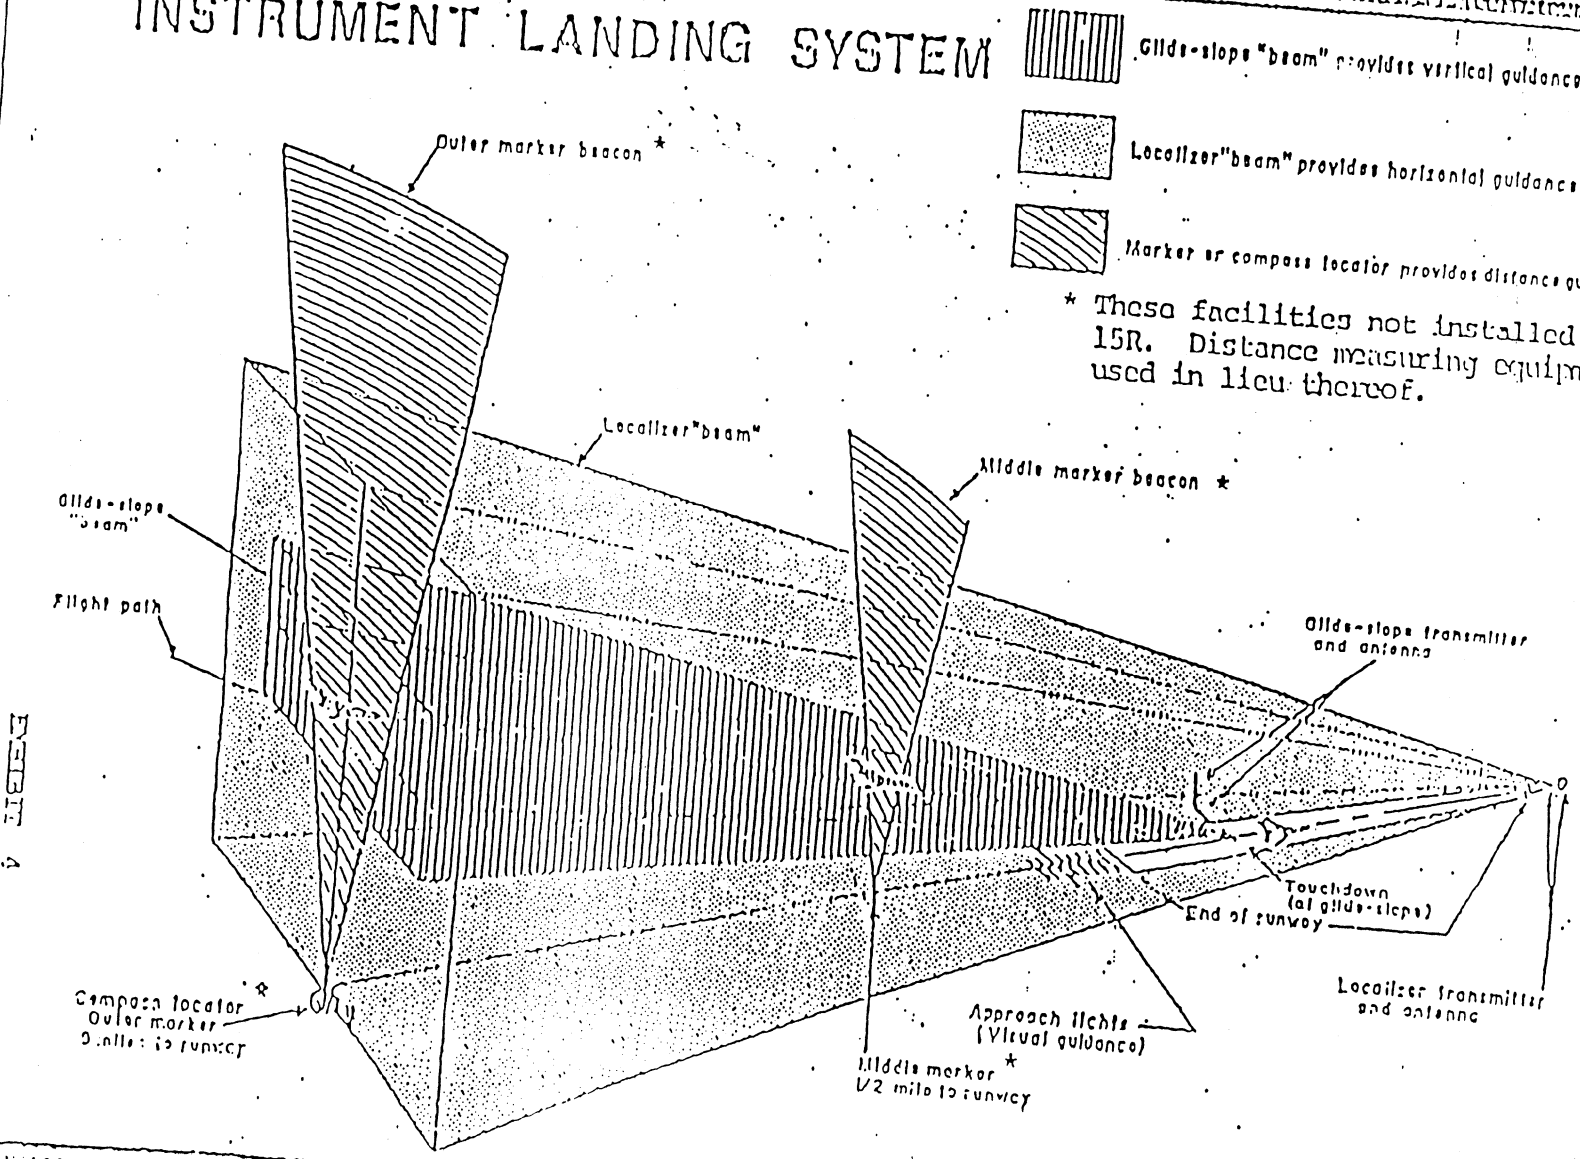
INSTRUMENT LANDING SYSTEM



* These facilities not installed on Runw
15R. Distance measuring equipment (D
used in lieu thereof.

Medium Intensity Approach Light System with Flashers (MALS,F)

1. MALS.

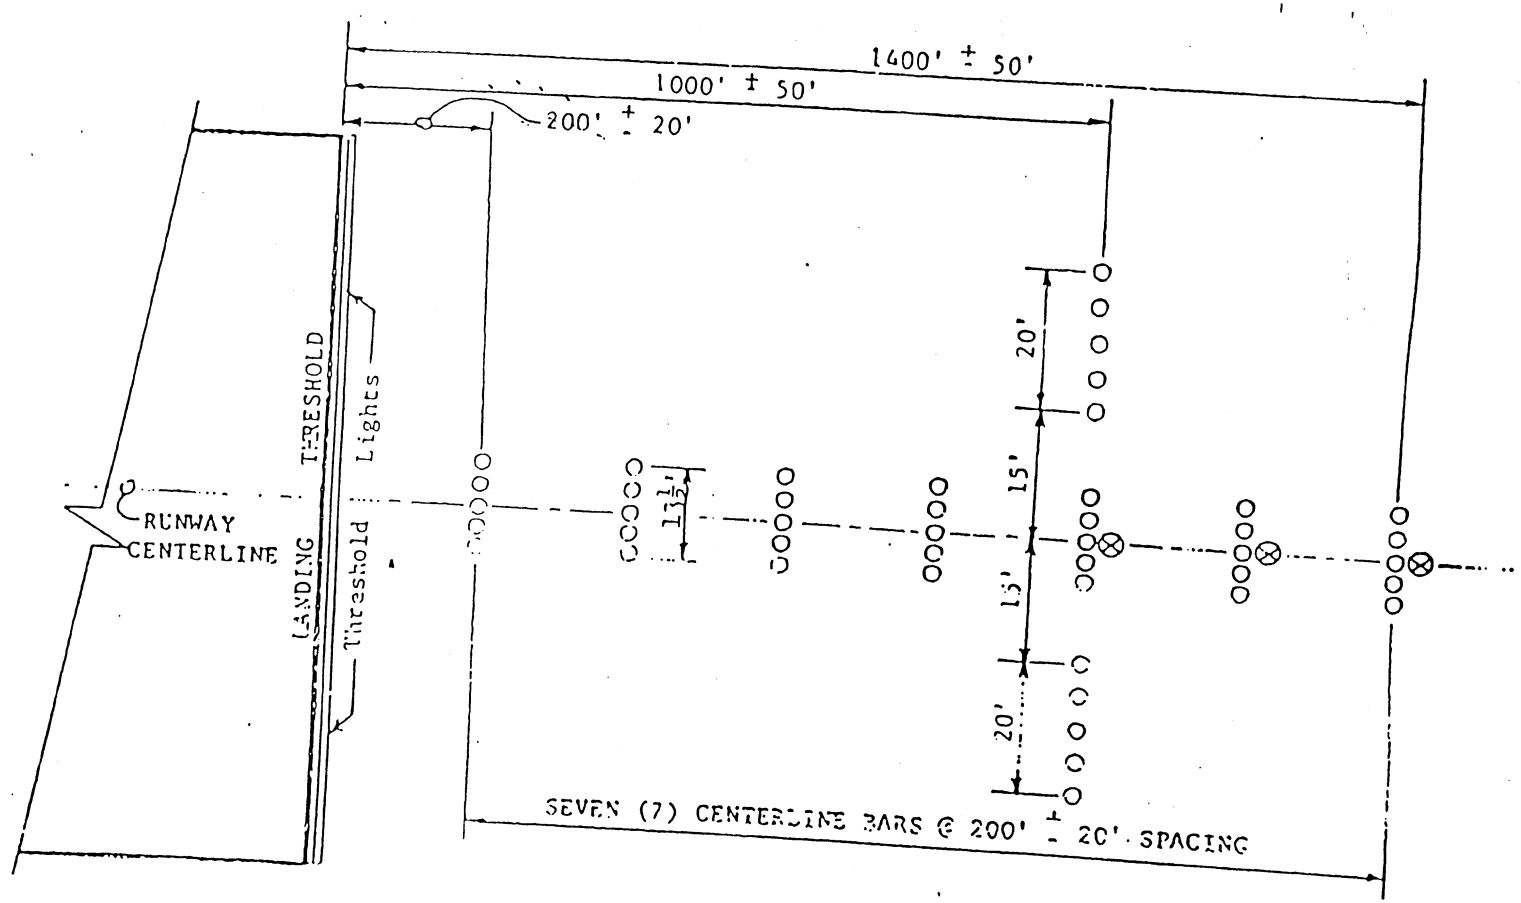
The Medium Intensity Approach Lighting System (MALS) will provide visual guidance to the pilot by radiating medium intensity focused light beams by which the pilot visually aligns the aircraft with the extended centerline of the runway. The MALS consists of light bars spaced 200 feet apart extending from the runway threshold to a point 1,400 feet from the runway threshold.

In addition to the eighteen steady burning lights in the threshold light bar, each light bar has five steady burning lights consisting of 200 watt incandescent lamps mounted below runway surface and directed through prisms in the flush mounted fixtures. These fixtures are spaced approximately 40½ inches apart facing the runway approach. The MALS at 1,000 feet from the end of the runway has two additional light bars each spaced 25 feet on each side of the centerline. The MALS will have three brightness intensities, low, medium, and high. The lights will be operated by Air Traffic Control Tower personnel.

2. Flashers.

The sequenced flashers are located at the last three light bar stations. These flashers are added to the MALS to assist pilots in making an earlier identification of the system. These lights flash in sequence toward the threshold at the rate of twice per second. The flashes are of extremely short duration, measured in microseconds.

Exhibit 6



MALSR Configuration
Boston-Logan Runway 15R

1. General

A Touchdown Zone Lighting System provides visual guidance to the pilot in the final phase of his landing approach to touchdown and can also serve as a visual extension of the approach light systems in earlier phases of the approach, particularly when associated with a short 1,400 foot approach light system such as the MALS/F.

2. Description

The TDZ system consists of 30 light bars symmetrically located on either side of the runway centerline, equally spaced at 100 feet intervals, and extending from the runway threshold for a distance of 3000 feet down the runway. Each light bar is 10 feet in width and contains three flush mounted light fixtures, the innermost fixtures being 36 feet from the runway centerline. Each light fixture contains one 200 watt lamp vertically mounted below runway grade. The light beam is directed toward the approach end of the runway through a prism in the slotted fixture top and at an angle of 5 degrees to the horizontal.

EXHIBIT B

LEASE TERMS

"WHEREAS, the Federal Aviation Administration (hereinater called "FAA"), wishes to install a [project description] at Logan International Airport for Runway 15-Right, and

WHEREAS, the Massachusetts Port Authority (hereinafter called the "Authority") desires to have said [project description] installed in accordance with the provisions of this lease.

WHEREAS, the FAA, which has the exclusive authority to control and manage the navigable air spaces, nevertheless recognizes the concerns and wishes of the Authority and the communities surrounding Logan.

NOW THEREFORE, the Authority hereby grants to the FAA the right to install, maintain and operate all equipment necessary or incidental for the operation of [project description] on Runway 15-Right at the locations hereinater specified in accordance with the following conditions:

1. This lease is for locations shown on FAA Drawing Nos. ____ attached hereto and made a part hereof as Attachments.

2. FAA shall have the right of access to said locations for all purposes consistent with the operation, installation, maintenance and repair of the [project description].

3. The landing minimums for Runway 15-Right will be established in accordance with those in existence on the date of this lease, which are a Minimum Decision Altitude of 268 feet MSL and visibility of 4000 feet RVR or 3/4 miles.

4. Should FAA at some future date propose to reduce landing minimums on Runway 15R, it will not do so prior to holding a public hearing and preparing a full environmental impact statement.

Letter 37
City of Boston
Honorable Mayor Thomas M. Menino

Code	Topic 1	Topic 2	Comment	Response
37.1	Environmental Review Process	Blue Ribbon Panel	The Commonwealth must convene a regional panel to evaluate the state of transportation in the region, develop comprehensive strategies to meet both short-term and long-term regional transportation needs, promote a greater variety of transportation options available for our citizens and our economy, and commit the Commonwealth to meet these goals in specific and feasible ways.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies form the basis of a comprehensive regional transportation strategy that includes the Airside Project at Logan Airport, expansion and growth of the regional airports, and the implementation of high-speed rail and other regional rail projects. All these measures are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. By the end of 2000, Boston residents had several alternatives to Logan Airport, including Worcester Regional Airport, Manchester Airport, T.F. Green/Providence Airport, Pease International Tradeport, and Amtrak's high-speed Acela train service. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of options to Logan Airport and steps Massport has taken to foster increased use of these alternatives. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its assumption of operating responsibility for the Worcester Regional Airport on January 15, 2000 and its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999. An additional Summit was held in December 2000, in Rhode Island. Refer to Section 2.9 for a discussion of Massport's initiatives in support regional transportation alternatives.
37.2	Air Quality	Impacts	Increased levels of VOC, CO and NOx emissions are projected as a result of anticipated growth at Logan.	Emissions are shown to decrease with the Preferred Alternative when compared to the No Action Alternative.

Mass\BLD\07468\Boston\Report\Renumbered Comments & Responses\Commenter 1A.doc

Code	Topic 1	Topic 2	Comment	Response
37.3	Air Quality	Impacts	Increase in auto and bus emissions will result from growth.	The proposed Airside Project will not stimulate additional growth in passenger activity levels at Logan Airport. Off-site motor vehicle emissions estimates are shown in Table 6.4-9 of the Supplemental DEIS/FEIR. Increases in the number of vehicles accessing Logan Airport are not analogous to increases in emissions. As indicated in the table, these emissions generally decrease in the future; as a result of improved motor vehicle emission standards, the increased use of alternative fuels, and other factors.
37.4	Air Quality	Taxiway Improvements	With the addition of the Centerfield Taxiway, there will be additional planes with idling engines adding to pollutant emissions near public beaches and residences.	The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on the taxiways reducing ground noise and emissions for close in residents of East Boston and Winthrop. Dispersion modeling indicates no violations of the NAAQS at any of the sites shown on Figure 6.3-1 of the Supplemental DEIS/FEIR, including those at public beaches and residential areas.
37.5	Air Quality	Model	Current Massport soot monitoring protocols are not sufficient to determine the effect on air quality.	The two soot monitoring programs conducted by Massport are scientifically accurate. Studies concluded that the soot was attributable to background (ambient) conditions in an urban environment, and not to airport-related activities. Refer to the *Logan Airport 1994/1995 GEIR* for additional information.
37.6	Air Quality	NAAQS	Current complaints about air quality, odor and soot emissions by affected residents continue and indicate current levels are not acceptable and have not been addressed.	Massport employs a GIS mapping system to correlate air quality and odor complaints with meteorology, airport use, and other factors. The soot sampling and monitoring programs indicate that Logan Airport is a very small (*i.e.*, less than one percent) contributor. In addition, the NAAQS serve as an indicator of the acceptability of current pollutant concentrations since these standards were designed to protect human health and welfare. Dispersion modeling indicates no violations of the NAAQS.
37.7	Noise	Taxiway Improvements	There will be additional noise from idling engines on the Centerfield Taxiway which will immediately impact residents of East Boston and Winthrop.	The ground taxi noise calculated for the northeast end of Runway 4/22, at locations in Winthrop and East Boston, show small to moderate *reductions* in ground noise of 2 to 3 dB for the Preferred Alternative when compared to the No Build Alternative (refer to Tables 6.2-15, 6.2-16, and 6.2-17 in the Supplemental DEIS/FEIR). This is true for average and for maximum propagation conditions and for all operational scenarios examined. The main reason for these noise decreases is the reduction of the number of taxiing aircraft waiting to takeoff on Runways 22LandR. The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on the taxiways reducing ground noise and emissions for close in residents of East Boston and Winthrop.
37.8	Noise	Impacts	Current complaints by residents indicate that existing noise levels are not acceptable.	Massport is a national leader in the implementation of an aggressive residential sound insulation program. Over the last decade, the affected population within the 65 dB DNL contour has been shrinking, attributable to improvements in aircraft technology and noise control, and better attainment of PRAS goals. Massport continues to explore means of further reducing noise in areas around Logan Airport.
37.9	Noise	Runway Use	Massport has indicated that Runway 14/32 is to be used primarily during periods of northwest winds and inclement weather. This will increase noise volumes in the flight path.	The operations of Proposed Runway 14/32 would be over the water. The departures on Runway 14 would turn over the inner harbor and proceed out the harbor mouth, as do the departures on Runway 15R, the nighttime preferential runway. Similarly, the last several miles of the approach path to Runway 32 would be over water and largely uninhabited islands. When Runway 14/32 is in operation, it would reduce the noise exposure over populated communities.

Code	Topic 1	Topic 2	Comment	Response
37.10	Noise	Runway Use	Lowering landing minimums on Runway 27 will increase noise for residents of Winthrop. Lowering landing minimums on Runways 22L and 15R will increase noise for residents of East Boston and Revere.	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.
37.11	Environmental Review Process	Permitting	Massport has not provided the Boston Conservation Commission with adequate information about its monitoring or its compliance with the Orders of Conditions to protect the harbor and the valuable remaining wetlands.	Massport presents data regarding outfall monitoring in its GEIR/ESPRs and its subsequent Annual Updates. Similarly, Massport has developed extensive documentation regarding its development of the new salt marsh restoration area along Taxiway November. The Airside Project has been designed in a manner to avoid any wetland or harbor construction and a mitigation program has been developed to ensure that the project will not adversely affect water resources.
37.12	Water Quality	NPDES Permit	Massport is not in compliance with the National Pollution Discharge and Elimination Systems permitted outfalls at Logan.	A review of NPDES outfall monitoring data since 1995 indicates that Massport has consistently improved compliance with its NPDES permit limits for its permitted outfalls. This information is reported to the EPA, as required, and also is reported on an annual basis in the Logan Airport GEIR and its Annual Updates.
37.13	Water Quality	Stormwater	No pollution treatment structures for the North, Porter and Maverick Outfalls, which serve 306 acres, are discussed as required.	The North and West Outfalls are equipped with water pollution control devices such as oil/water separators and grit collectors, and were upgraded in Spring 2000. The construction of the Centerfield Taxiway or Runway 14/32 would not affect the drainage system for the North Pollution Control Facility. Similarly, the drainage system for the Maverick Street and Porter Street outfalls would be unaffected by the proposed taxiway construction. Construction, however, would occur in portions of the drainage area for the West Outfall and a number of the smaller culverts that drain the airfield. Approximately 55 acres of the airfield drainage will be redirected from the West Outfall to existing perimeter drains. The perimeter drains will be directed through a low-flow chamber sized to handle the first flush of stormwater before being discharged. This reconfiguration is shown in Figure 6.6-1 of the Supplemental DEIS/FEIR. The reconfiguration results in an 18 percent reduction in the drainage area for the West Outfall. The reduction in flow of generally uncontaminated airfield drainage is expected to increase the efficiency of the West Outfall to treat flow from the terminal areas. As described in Section 6.6.4 of the Supplemental DEIS/FEIR, Best Management Practices will continue to be implemented to minimize the discharge of sediment, and a low-flow chamber will be installed to treat first flush stormwater flows from drainage areas redirected from the West Outfall.

Code	Topic 1	Topic 2	Comment	Response
37.14	Alternatives	Blast Fence	Before its removal, alternatives to the Blast Fence that provides marginal protection from noise, fumes and blast effects from take-offs for residents must be identified and funded.	The blast fence is not part of the Airside Project. Removal of the blast fence underwent a separate state environmental review process. An EOEA Certificate requiring no further environmental analysis was issued in February 2001.
37.15	Health Effects	Studies	To date, little or no analysis or study of the affects on public health from Logan operations has been conducted.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.
37.16	Environmental Justice	Impacts	No analysis of federal Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations."	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative.
37.17	Cumulative Impacts	Master Plan	The DEIR/S does not address the link between air transportation supply and ground transportation demand.	The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis.
37.18	Purpose And Need	Delay	The DEIR/S assumes that passenger traffic at Logan Airport will grow irrespective of airport capacity and resulting delay.	Growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in current and future passenger and aircraft activity at Logan Airport.
37.19	Environmental Review Process	FAA/NEPA	The DEIR/S does not present a reasoned Build vs. No-Build analysis of airport capacity with and without Runway 14/32, nor the resulting impacts on ground transportation (regional highways, local streets, transit modes).	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates).

Code	Topic 1	Topic 2	Comment	Response
37.20	Ground Transportation	Access to Logan Airport	The DEIR/S does not adequately justify some of its future projections of transit and HOV mode share.	The Airside Project does not result in additional demand for ground access services. Refer to the *Logan Airport 1994/95 GEIR* which includes Massport's Ground Access Management Plan, targeted HOV shares, forecasted Vehicle Miles Traveled, and trips by mode for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis. The *Logan Airport 1999 Environmental Planning and Status Report* (previously GEIR) provides a status report on Massport's ground access initiatives and HOV ridership for 1999.
37.21	Ground Transportation	HOV	The DEIR/S does not differentiate the various types of HOV travel, nor does it take into account the full impacts of certain types of travel that are considered HOV (e.g., taxi and drop-off trips, passengers who drive alone to park in Chelsea are considered HOV trips because they take a shuttle one mile to Logan).	Refer to response to Comment 37.20.
37.22	Ground Transportation	TMA	The DEIR/S does not provide adequate information on Logan Transportation Management Association membership, participation, or plans for increasing participation.	The *Logan Airport 1999 Environmental Planning and Status Report* reported on Logan Airport Employee TMA achievements in 1999, including an increase of 14 member organizations, with a total of 6,200 employees.
37.23	Ground Transportation	Access to Logan Airport	The DEIR/S does not provide adequate proposals for improving utilization of the MBTA Blue Line by air passengers.	The Blue Line Modernization Program is discussed in the *Logan Airport 1999 Environmental Planning and Status Report* (formerly the GEIR) which was filed with the Secretary of Environmental Affairs on December 15, 2000.
37.24	Purpose and Need	Airfield Capacity	The DEIR/S does not adequately justify construction of the Centerfield Taxiway. Adequate runway crossing opportunities and airplane queuing capacity currently exist, and the construction of the Centerfield Taxiway would result in excessive aircraft idling.	The Centerfield Taxiway will significantly reduce ground delays and enhance the controllers' flexibility in routing inbound and outbound aircraft when Runways 4L/R or 22L/R are in use. The Centerfield Taxiway will *reduce* aircraft idling, particularly on Taxiways November, Romeo and Yankee waiting to cross Runway 4L/22R. For more details, refer to responses to Comments 37.64 through 37.69.
37.25	Purpose and Need	Delay	Runway 14/32 would address weather-related delays, but these are only a portion of the airside delays. The DEIR/S does not provide information on the relative impact of different causes of delay: weather, mechanical, and delays originating from other airports.	Delays occur when wind or weather conditions require the use of configurations with fewer than three active runways, when poor weather requires increased separation distances between aircraft, or when airlines schedule more flights than Logan Airport can handle. The Airside Project is designed to reduce delays at Logan Airport from adverse winds and taxiway congestion by addressing constraints at Logan Airport. Delays caused by conditions at other airports or other factors, such as mechanical failure, are not addressed since Massport cannot influence these delays. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports.

Marvin\D\748\Documents\Renumbered Comments & Responses\Comments 1A.doc

Code	Topic 1	Topic 2	Comment	Response
37.26	Alternatives	Peak Period Pricing	The DEIR/S discounts peak period pricing because it is assumed to reduce regional air service. Massport should analyze a peak period pricing scenario, which considers a shifting of some service to other regional airports.	Regional carriers are not likely to shift operations to regional airports in response to PPP because doing so would likely reduce on-board passengers and the economic viability of the service. Regional carriers at Logan Airport carry a mix of local and connecting passengers. As the largest city in New England, Boston and the immediate vicinity represent the largest concentrations of local demand for regional carrier markets. Also, up to 50 percent of passengers on regional flights connect to other flights at Logan Airport. Shifting regional flights to other airports, such as Manchester or T.F. Green/Providence, would likely reduce the number of on-board passengers since a significant number of passengers are traveling to the City of Boston or connecting to flights that are not available from the regional airports. For example, service to Manchester Airport would not be a viable alternative for a Provincetown passenger traveling to a location in downtown Boston. Likewise, service to T.F. Green/Providence Airport would not be attractive to a Bangor passenger trying to reach Denver, since there are no nonstop services between Providence and Denver.
37.27	Regional Transportation	Regional Airports	There is no description of a regional plan that actually diverts traffic from Logan.	The regionalization of aviation in New England is currently underway. As a result of capital investment, service expansion at regional airports and coordinated efforts between Massport and other federal, state and local agencies, since 1996, eight out of ten new passengers in New England are using the regional airports. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of the emerging roles of the Logan, T.F. Green/Providence, Manchester, and Worcester Regional airports in the aviation transportation system and on upcoming New England Airports System Study.
37.28	Regional Transportation	Regional Airports	There are no funding requests in the Transportation Bond Bill for upgrades at Worcester, Hanscom, or Fort Devens to improve infrastructure and public transit as part of a regional strategy.	Worcester Regional Airport has existing terminal and airport infrastructure and has been targeted for increased use and future service expansion. MassHighway is in the process of beginning the preparation of the Draft EIS/EIR for highway improvements to improve access to Worcester Regional Airport..
37.29	Alternatives	Peak Period Pricing	Peak pricing is not explored as a tool to divert flights in the region.	Section 4.5 of the Supplemental DEIS/FEIR discusses PPP at length. Chapter 2 of the Supplemental DEIS/FEIR addresses ongoing regional strategies.
37.30	Purpose and Need	Airfield Capacity	The City of Boston views the proposed project as a capacity enhancement plan.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway would not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year, but rather would allow this capacity to be maintained more consistently.

Code	Topic 1	Topic 2	Comment	Response
37.31	Environmental Review Process	Blue Ribbon Panel	The City of Boston finds the DEIS/R deficient in many respects and respectfully requests that...[a] regional panel of experts be convened to immediately assess the overall state of transportation in the region; [t]his panel develop strategies for both short- and long-term regional transportation needs and identify a variety of transportation options available for the traveling public and the movement of goods; and [c]ommunities in the region be fairly and adequately represented on such a panel along with public officials, economists, land use planners, and representatives of environmental and public health interests.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. As summarized in the Draft EIS/EIR, a number of studies that address regional transportation planning issues have been conducted over the last ten years. These studies have concluded that the Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high speed rail are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Chapter 2 of the Supplemental DEIS/FEIR discusses the entire region's air transportation system, along with a discussion of alternative modes, specifically high-speed rail, and describes the regional study and its major conclusions.
37.32	Air Quality	Alternative Fuels	Massport is to be commended for its program to convert its ground service vehicle fleet to alternative-fueled vehicles.	Comment noted. Massport has initiated and participated in a number of programs to encourage use of alternative fuels at Logan Airport, and has received national recognition for its efforts.
37.33	Air Quality	Alternative Fuels	The City has suggested in prior comments on Massport MEPA filings that important steps in mitigating the air quality impacts of Logan may include lease agreements with new or renewing tenants that contain requirements or incentives, such as reduced curb fees for private fleet operators, for use of low or no emission vehicles by tenants.	Massport offers a 25 percent discount on ground access fees to operators of qualified alternative fuel vehicles (AFVs). In addition, Massport has participated in several grant programs to encourage tenant use of AFVs. A status report on achievement of Massport ground access initiatives is provided in the *Logan Airport 1998 Annual Update* and is reported in the *Logan Airport 1999 Environmental Planning and Status Report* (previously GEIR).
37.34	Air Quality	Impacts	The City believes that additional measures are necessary and requests that Massport and a regional transportation task force investigate other available technologies, particularly from companies based in the region, for reducing air emissions.	Massport is separately studying measures for reducing Logan Airport's contribution to air emissions in the region, in the *Logan Airport 1999 ESPR* (previously GEIR). Consideration is given to all emissions sources, and analysis is conducted for the airport, East Boston and regional study areas.
37.35	Ground Transportation	Mitigation	For several years, Massport has indicated that it is evaluating the benefits of moving bus servicing and other operations to off-airport locations. This will add vehicle trips to current levels, a detriment to air quality. The City has twice requested that a detailed analysis and discussion be presented in a GEIR or Annual Update but Massport has never responded to this inquiry.	Massport's efforts to minimize vehicle trips are documented in the *Logan Airport 1999 ESPR* (previously GEIR). Massport continues to evaluate the benefits of moving bus services to off-airport locations. No definitive decision has been made at this time.

Code	Topic 1	Topic 2	Comment	Response
37.36	Air Quality	Impacts	Massport has stated in prior environmental review documents that PM2.5 data for aircraft are not currently available. This is surprising since aircraft engines have undergone emissions testing for many years. This should be a subject evaluated in scientific and technical detail by the regional panel of experts. Findings and recommendations on this issue should be a component of a regional transportation report.	Particulate Matter (PM) emission factors for aircraft are very limited, at best, and nonexistent in most cases. Therefore, as a conservative, worst-case assumption, the air quality analysis assumed that all PM is less than 10 microns in diameter. No emission factors or approximation methods are available for $PM_{2.5}$.
37.37	Air Quality	Model	Given the continued reporting of anecdotal evidence of soot deposition and the open issues as to the accuracy and robustness of the soot monitoring protocol...this matter demands further study. Coupled with the continuing problem of odor from aircraft operations, the overall emissions from all airside operations should be the subject of a truly comprehensive, state-of-the-art monitoring and modeling study.	Monitoring of airborne soot levels in the vicinity of Logan Airport has shown that the airport is a very small (less than one percent) contributor. The air quality analysis, based on EPA/MDEP models and guidelines, performed for the Supplemental DEIS/FEIR is considered to be comprehensive and state-of-the-art.
37.38	Air Quality	NAAQS	The proposed Runway 14/32, at a minimum, facilitates more aircraft operations per hour during certain weather conditions. This is especially of concern when 14/32 is used for departures (wind out of the southeast) and emissions from take-off are blown back into the neighborhood. The result is that the Jeffries Point neighborhood and surrounding areas may experience an increase in concentration of jet emissions during southeast wind conditions.	The dispersion modeling results indicate that concentrations of pollutants will be below the NAAQS at all times. The Supplemental DEIS/FEIR reports worst-case conditions, meaning air quality will be better than this under almost all conditions. A full year of actual weather data was used to conduct the dispersion analysis. In summary, actual wind conditions have been used to model pollutant concentrations at Jeffries Point, where no violations of the NAAQS were projected. Furthermore, Runway 14/32 will primarily be used for arrivals. Also it will not increase the number of operations during northwest winds, but will allow projected operations to be accommodated with fewer delays.
37.39	Alternatives	Runway 14/32	Runway 14/32 is part of Logan Airport's overall program to increase passenger levels to a minimum of 37.5 million in 2010 and, as such, contributes to the increase in emissions generated by the new aircraft operations.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport. Refer also to Section 4.2. The availability of Runway 14/32 is projected to produce a small improvement in air quality from improved efficiency of airfield operations.
37.40	Noise	Taxiway Improvements	The City respectfully disagrees with the statement in the DEIS/R that the Centerfield Taxiway will reduce noise impacts from taxiing aircraft in the areas located north/northeast of the airport.	Comment noted. Massport reaffirms the validity of its analysis. Refer to responses to Comments 37.7 and 37.24.
37.41	Alternatives	Preferred Alternative	East Boston residents view the blast fence as a device the partially mitigates fumes, noise and blast effects from takeoffs on Runway 22R. Massport believes that it has an obligation to take the fence down because it is non-frangible, and would therefore present a hazard to flight personnel and air passengers in the event of a crash. ... An alternatives analysis, prior to the filing of environmental documents, should include the results of a detailed investigation of a non-frangible barrier and other methods to ensure that the quality of life in and adjacent to Orient Heights is not further degraded.	Refer to response to Comment 37.14.

Code	Topic 1	Topic 2	Comment	Response
37.42	Noise	Runway Use	The City does not agree with the FAA's assertion that lowering landing minimums will result in noise benefits for residents under the approach path to the runways in question. ... Lowering the landing minimums is likely to result in the use of these runways more often during poor weather conditions, exposing nearby residents to noise levels which they currently do not experience. The City of Boston believes that lowering the landing minimums will only serve to expose already overburdened residents to additional noise impacts.	Response to Comment 37.10 addresses the fact that the flight paths themselves do not change, and Appendix D in the Airside Project Draft EIS/EIR includes a complete discussion of the impacts of lowered landing minimums. The lowered minimums allow the use of runways more closely aligned with the prevailing winds, thereby increasing safety. The runway use would change imperceptibly by the reduced minimums—less than 0.2 percent of equivalent operations—and these flights represent shifts from Runway 4, not additional operations.
37.43	Alternatives	Reduced Approach Minimums	The DEIS/R indicates that the reduction of approach minimums is consistent with the minimums in effect at other major commercial airports. Current industry practice for major commercial airports allows for greater use of the four runways under certain weather conditions. ... The City questions if the referenced "major commercial airports" are located in similar areas. When other major commercial airports are referenced in environmental review documents, the locations and characteristics of these airports should be detailed.	The reduced minimums at Logan Airport would be consistent with recommended practices as established in FAA Order 8260.3B, *United States Standards for Terminal Instrument Procedures*. These standards are used at all airports in the United States, and in many other nations around the world. These standards are already used for Runway 4R approaches at Logan Airport. To cite two typical examples, both La Guardia New York and Washington Reagan Airports have Category I ILS with a minimum ceiling of 200 feet above ground level and one half-mile visibility.
37.44	Alternatives	Reduced Approach Minimums	As noted in the DEIS/R, the City of Boston entered into an agreement with the FAA and Massport not to decrease the landing minimums on Runway 15R. It is our intention that this agreement should be respected and honored... With the high number of residents living alarmingly close to the touchdown point of these two runways (22L and 15R), the lowering of the landing minimums will place these residents in additional peril.	The agreement between the City of Boston, the FAA and Massport stipulates that any modification of the existing minimums requires completion of an EIS/EIR, even though the setting of minimums is otherwise categorically excluded from the EIS/EIR process. The reduced minimums will, in fact, enhance safety by providing precision guidance to a point closer to touchdown and reducing reliance on Runway 4R under poor weather conditions, when winds may favor use of an alternate runway. Also, refer to responses to Comments 37.10 and 37.42.
37.45	Water Quality	NPDES permit	The City finds this reporting [on NPDES permitted outfall monitoring] imprecise and misleading and it is apparent that discharges are not meeting the EPA's NPDES limits.	Refer to response to Comment 37.12
37.46	Water Quality	NPDES permit	The DEIS/EIR does not identify any pollution treatment structures for the North, Porter and Maverick Outfalls that, combined, serve a 306-acre drainage area. It is also unknown if the 50 perimeter outfalls treat pollutants and if they are monitored and maintained.	Refer to response to Comment 37.13. As required by its NPDES Discharge Permit, Massport conducts water quality monitoring at the four outfalls that convey drainage from the "industrial" portions of Logan Airport, such as the fuel farms, terminals, car rental facilities, and maintenance facilities. These are the North, West, Porter and Maverick outfalls. Federal regulations do not require Massport to monitor the "non-industrial" drainage from the airfield that discharges through approximately 50 perimeter outfalls. The perimeter outfalls are not equipped with treatment devices, since the airfield areas they drain are not a significant source of contaminants or suspended solid materials. The perimeter outfalls are routinely inspected and maintained, as needed, by Massport.
37.47	Water Quality	Stormwater	While Massport identifies its existing drainage structures, there is no information describing drainage plans for 14/32 runoff. ... The proposed airside improvements will result in the conversion of 39.4 acres of vegetation to paved surface. Massport anticipates the need to use more de-icing agent with the proposed improvements. If overland dispersion is presently a method of treating these compounds, how will the loss of 39.4 acres be addressed? How will Massport mitigate this loss of pervious area?	As stated in the Draft EIS/EIR, Runway 14/32 will be de-iced when weather conditions dictate. Taxiways are, however, not routinely deiced and there will be no additional aircraft deicing or satellite deicing stations required for the project. The existing drainage system will be reconfigured, where necessary, to accommodate additional stormwater runoff. As stated in the response to Comment 37.46, the airfield is not a significant source of contaminants. However, Massport will install a low-flow chamber to capture any contaminants contained in the first flush stormwater. Although portions of the airfield pervious surfaces will be paved, adequate vegetated areas will be provided between paved surfaces and the new drainage inlets to provide suitable levels of treatment.

Code	Topic 1	Topic 2	Comment	Response
37.48	Water Quality	NPDES permit	It is obvious when one reviews Logan AUs (GEIR Annual Updates) that Massport is experiencing difficulty in complying with the BCC (Boston Conservation Commission) Orders of Conditions and EPA NPDES permits conditions...The City asks that Massport review its permits, including all perpetual Orders of Conditions, and provide evidence that these conditions are being met.	As a condition of the NPDES Permit, Massport monitors water quality for pH, Oil and Grease, and Settleable Solids three times each month at the North, West, Porter and Maverick outfalls. These outfalls include all drainage from the terminal and fuel farm areas, and some runway and infield areas. The monthly monitoring is conducted (1) in dry conditions; (2) in wet weather conditions and (3) immediately following a storm event. This sampling and other monitoring has helped Massport to improve permit compliance significantly. During 1998, there was 100 percent compliance for pH. Oil and Grease limits compliance was 100 percent at the West Outfall; 97 percent at the North and Maverick Outfalls; and 94 percent at the North Outfall. A copy of the 1998 Water Quality Management Update is contained in the *Logan Airport 1998 Annual Update* and additional information is provided in Appendix I of that document. (Refer to Table of 1998 NPDES Compliance and Summary of 1995-1998 Compliance Averages). Massport's outfall sampling summary for Logan Airport in 1999 is contained in Appendix H of the *1999 ESPR.*
37.49	Water Quality	Stormwater	[Provide documentation that this commitment is being met]: DEP File No. 6-464, March 13, 1991, Logan Landscaping Improvements Special Conditions.	All on-site drainage structures are routinely inspected. As with all Logan Airport construction projects, contractors are required to implement and maintain full erosion and sediment control program throughout construction. Massport has an ongoing program to stencil surface drains that discharge to Boston Harbor.
37.50	Environmental Review Process	Permitting	[Provide documentation that this commitment is being met]: DEP File No. 6-467, June 19, 1991, Massport Employee Parking and Associated Roadway Special Conditions.	Although permit approvals for this project were secured, Massport never constructed this project.
37.51	Environmental Review Process	Permitting	[Provide documentation that this commitment is being met]: DEP File No. 6-516, July 22, 1992, Massport Test Borings/Logan.	There were no discharges or spillage of fuel, oil, or other pollutants during the test boring program. As with all Massport contracts, an emergency spill management program was in effect throughout the test boring program.
37.52	Environmental Review Process	Permitting	[Provide documentation that this commitment is being met]: DEP File No. 6-544, May 12, 1993, Logan Safety Ends.	During construction of the Runway-End Safety Improvements, erosion and sedimentation control practices were fully employed. Exposed landside soil was stabilized and vegetated quickly. Siltation booms were deployed in Boston Harbor and water quality monitoring was conducted as required in the Boston Conservation Commission Order of Conditions. Massport continues to monitor and maintain the runway end safety areas to assure their stability. There were no newly constructed or relocated catch basins associated with construction of the runway end safety improvements.

Code	Topic 1	Topic 2	Comment	Response
37.53	Ecosystem	Rare Species	The City strongly objects to the suggestion that off-site [habitat] mitigation should occur outside of the Boston Harbor area.	Upland Sandpipers require extensive areas of grassland habitat. This type of habitat has dwindled steadily throughout New England as a result of natural succession of these areas to forest and through development. Many of the remaining large grassland areas in the Commonwealth and throughout New England are found at airports. Because of the hazard that birds present to aircraft and the flying public and because of the potential hazards to the birds, Massport has worked with the Natural Heritage and Endangered Species Program to develop a mitigation program that is removed from airport operations to the maximum extent practicable. Camp Edwards provides an excellent opportunity to reclaim a former grassland that is currently being lost to forest and restore a population of Upland Sandpiper that has declined over the past decade. Restoration of a degraded habitat is considered to have a much greater potential for success as compared to constructing a new habitat area of over a hundred acres in the Boston Metropolitan area even if such a suitable site were to be located.
37.54	Health Effects	Studies	The Boston Public Health Commission believes that Massport, the FAA and the U.S. Department of Transportation have failed to take the health of Boston residents into consideration in planning the proposed project.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport.
37.55	Environmental Justice	Impacts	The City asks that the FAA and DOT comply with Executive Order 12898 and provide documentation and all relevant data to that effect.	Refer to Section 6.8 of the Supplemental DEIS/FEIR for a discussion of the Environmental Justice analysis. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected by the Preferred Alternative. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative.
37.56	Environmental Review Process	MEPA	The City of Boston requests that the Secretary find this DEIS/R inadequate on the grounds that there is no analysis of the landside transportation impacts of the proposed Runway 14/32. The DEIS/R's reliance on analysis included in the GEIR is unacceptable, since the GEIR does not include specific impacts related to Runway 14/32. The City finds that many of the GEIR's assumptions related to HOV and transit modes are questionable, and that these assumptions should be re-examined.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act..." Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
37.57	Purpose and Need	Delays	The DEIS/R's neglect of landside transportation issues is based on the premise that Runway 14/32 will not add capacity, only relieve delay. The City strongly questions the premise that passenger demand at Logan Airport is inelastic with respect to delay...It is illogical to suggest that such an increase in delay would not result in a shift in air service to New England's other airports or other services to substitute for air travel to and from Logan Airport.	The construction of unidirectional Runway 14/32 would not be expected to induce additional aircraft operations or passenger traffic at Logan Airport. Refer to Section 4.2. Increased use of the regional airports surrounding Boston and alternative transport modes (*e.g.*, high-speed rail) is reflected in the planning forecasts used for the Airside Project operational and environmental analyses.
37.58	Regional Transportation	Regional Airports	Such a shift in activity [to air service to New England's other airports] would result in divergent Build and No-Build conditions. This demands that Massport analyze the difference between the Build and No-Build conditions. Massport should be required to examine runway operational capacity, landside trips by mode, impact on roadway and transit capacity, and unfulfilled passenger and cargo demand that could be accommodated at other regional airports and transportation facilities.	Both the No Action Alternative and the Preferred Alternative assume increased use of regional transportation options. Analysis of operational capacity for Logan Airport runway configurations under various weather conditions was performed and represents a central input in the operational analysis presented in Chapter 4 of the Supplemental DEIS/FEIR. The recommended airside projects will not affect ground access demand or capacity at Logan Airport. The *Logan Airport 1999 ESPR* (previously GEIR) reports on vehicle trips by mode for both current and forecast passenger demand levels at Logan Airport. Chapter 2 of the Supplemental DEIS/FEIR examines passenger demand that could be accommodated at the regional airports surrounding Boston.
37.59	Ground Transportation	Impacts	The GEIR's traffic analysis sections have consistently been fraught with unsupported assumptions and questionable methodologies. ... The Boston Transportation Department suggests that Massport re-think traffic impact analysis in terms of vehicle-miles traveled and passengers per vehicle trip.	*The Logan Airport 1999 Environmental Planning and Status Report* (previously GEIR) includes an updated traffic impact analysis that discusses Vehicle Miles Traveled and Massport's ground access management achievement.
37.60	Ground Transportation	Access to Logan Airport	Massport appears to rely on additional passenger and employee parking facilities just outside the East Boston parking freeze area to get employees and passengers within shuttle range of the airport. This puts an increased burden on private sector carriers and nearby communities to accommodate potentially dramatic increases in vehicle trips. This would certainly seem to work against the goals of the Transportation Management Association (TMA).	There are currently approximately 2,000 active airport employee and commercial parking spaces at various off-airport locations in Chelsea, which is outside the limits of the East Boston Parking Freeze area. These include 1,550 airport employee parking spaces in the Chelsea Parking Garage that are leased by Massport, 500 airport employee parking spaces that are controlled by Delta Air Lines for their employees, and 800 commercial parking spaces at the Park, Shuttle and Fly site on Marginal Street. The environmental impacts of these parking spaces were analyzed as part of the *Chelsea Garage DEIR* (prepared in 1992) and were confirmed by an additional analysis conducted in support of the *West Garage Final EIR* (prepared in 1995). Both analyses demonstrate that the provision of these parking spaces reduces vehicle trips and VMT on local East Boston streets and results in measurable air quality benefits.
37.61	Ground Transportation	TMA	The 1997 Annual Update does not provide information about the number of employees who belong to the TMA or who receive an MBTA pass subsidy. No explanation is offered for the TMA estimate that a reduction of only 250 to 300 employee commuter vehicle trips may result from Transportation Demand Management measures.	The *Logan Airport 1999 Environmental Planning and Status Report* (previously GEIR) provides an accounting of the achievements of the Logan Airport Employee TMA. In 1999, five new organizations joined the TMA, bringing member organizations to 14 and the number of employees to 6,200.
37.62	Ground Transportation	Access to Logan Airport	Completion of the MBTA's Blue Line Modernization Program is described as a project that, in conjunction with the Airport Intermodal Transit Connector and other transit projects, will help increase the number of airport passengers using transit. Although the MBTA has not announced a final project schedule for the Blue Line project, it has been progressing at a slower than anticipated pace. This situation must be taken into account in assessing the impacts of increased operations and passenger levels.	Refer to response to Comment 37.23.

Mara\LDG7403\Documents\Renumbered Comments & Responses\Comments 1A.doc

Code	Topic 1	Topic 2	Comment	Response
37.63	Purpose and Need	Airfield Capacity	It is not clear why three (3) crossing points to Runway 4L are insufficient to handle most, if not all, capacity situations. Based on Massport's assertion that three crossing points are inadequate, specific information is lacking to substantiate the claim... The Runway 4R scenario fails to justify the benefits of the Centerfield Taxiway... Massport's claim that the Centerfield Taxiway will move this type of activity away from the community lacks merit.	Currently, approximately 75 percent of Runway 4R jet arrivals exit at Taxiway Yankee or Runway 33R. These aircraft cannot exit earlier because of landing distance requirements, and exiting on Taxiway Romeo or later greatly increases taxi time and distance unnecessarily. Aircraft crossing at Runway 33R are forced to queue on the runway to cross Runway 4L at this single crossing point and then use Taxiway November (along with any aircraft that exited via Taxiway Romeo or later) to get to the terminals. This queuing and the use of Taxiway November has adverse air quality and ground noise impacts on East Boston near Constitution Beach. The Centerfield Taxiway will allow these aircraft to taxi southward and cross the runway simultaneously at multiple points closer to the terminals. Appendix K in the Airside Project Draft EIS/EIR demonstrates that these delays will be cut by nearly 48 percent or more. It will also reduce congestion on Inner and Outer Taxiways Alpha and Kilo.
37.64	Alternatives	Taxiway Improvements	While the Centerfield Taxiway would provide an additional taxiing route to both Runways 22L and 22R, the City believes that the delay benefits may be exaggerated...The Centerfield Taxiway will be 9,300 feet in length. Since both the FAA and Massport will not agree to limit the number of aircraft allowed to queue on the Centerfield Taxiway, this will result in the potential for FAA ground controllers to approve permission for 40 to 50 aircraft to taxi to either Runway 22R or 22L. The City finds it difficult to comprehend how any aircraft located in the rear of this enormous queue would depart any earlier than if the pilot was waiting at a gate with the plane's engines off. Delays would remain, with the only difference being in the location of the aircraft at the airport.	Refer to response to Comment 37.130. The estimates of the taxiway delays were generated with FAA-approved and universally accepted modeling techniques, and the delay benefits are realistic expectations. Forty to fifty aircraft represent nearly an entire hour's departure flow at peak traffic conditions, and only about ten percent of these use Runway 22L. Extra aircraft idling on the taxiway system would cause unnecessary costs to the airlines, unnecessary environmental impacts, and increased taxiway congestion which would inhibit the ability of controllers to move aircraft to and from the runways.
37.65	Alternatives	Taxiway Improvements	Additional information and clarification are necessary on the environmental benefits [of the Centerfield Taxiway], both from a noise and air quality perspective.	Section 6.2 of the Supplemental DEIS/FEIR shows that there are small noise benefits from the construction of the Centerfield Taxiway. The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on the Taxiway November, thus benefiting East Boston. It also should eliminate aircraft landing on Runway 4R from waiting to cross Runway 4L and aiming their intake noise toward Constitution Beach. Section 6.4 of the Supplemental DEIS/FEIR discusses the air quality benefits of the Centerfield Taxiway.
37.66	Alternatives	Taxiway Improvements	The City of Boston believes that possible delays on Echo Taxiway from arrivals on Runway 22L also fail to justify the construction of the Centerfield Taxiway...How many crossing points are required in order for the air traffic controller to have a safe and efficient set of options? Also, what are the environmental benefits related to the Centerfield Taxiway if a pilot enters the Centerfield Taxiway and heads back towards the community seeking a place to cross Runway 22R?	Approximately 75 percent of jet aircraft arrivals exit Runway 22L at Taxiways Papa or Echo, leading to a single crossing point. Runway 27 jet arrivals also must move through this Southwest Corner area. The Centerfield Taxiway will allow aircraft to taxi north to crossing points at Charlie or Foxtrot. The aircraft can then cross at points closer to Terminals C and E without incurring delays in the Southwest Corner or causing increased congestion on Taxiways Alpha and Kilo near Terminals B and C. Allowing aircraft to bypass Southwest Corner and Taxiway Alpha/Kilo congestion will reduce environmental impacts from ground operations, and moving from Taxiway Echo to Taxiway Charlie or Taxiway Foxtrot will not move the impacts significantly closer to the communities.

Code	Topic 1	Topic 2	Comment	Response
37.67	Alternatives	Taxiway Improvements	Massport has listed as one of its criteria for the construction of the Centerfield Taxiway the concern about wing-tip clearance conflicts on Taxiways Alpha (Inner) and Kilo (Outer). Should the Inner Taxiway remain in service subsequent to the construction of the Centerfield Taxiway? What is to prevent this potential conflict from remaining a concern?	Congestion on the Inner and Outer Taxiways is already a problem because pushbacks on Taxiway Alpha can interfere with and delay operations on Taxiway Kilo. As some future aircraft wingspans increase, wingtip clearance may occasionally increase congestion. Taxiway Kilo will still be needed for maneuvering most aircraft past Terminals B and C, since unnecessary runway crossings would have a detrimental impact on airfield capacity.
37.68	Alternatives	Taxiway Improvements	The City questions how the Centerfield Taxiway would enhance the general safety of airside operations, since the dramatic increase in the number of simultaneous aircraft ground movements could increase the potential for ground incursions on Logan's complex taxiway system.	The Centerfield Taxiway will not increase the number of ground operations at Logan Airport. It will simply increase controller flexibility and reduce delays. The number of aircraft on the taxiway system is directly related to the number of flights operating at Logan Airport and will not change because there is another taxiway.
37.69	Alternatives	Taxiway Improvements	Taking into consideration the Centerfield Taxiway length (9,300 feet) and the proposed location, a pilot not familiar with the airport may experience an identification problem while on approach to either 22L or, for small aircraft, 22R.	Practically every major airport with parallel runways (including Logan Airport) also has parallel taxiways. Runway markings, air traffic control procedures, and electronic approach guidance during poor visibility make mistaking taxiway for a runway highly improbable. The Centerfield Taxiway will satisfy all applicable FAA safety regulations regarding its design, construction, lighting, marking, signage, and use.
37.70	Alternatives	Taxiway Improvements	The November Taxiway will remain in operation. Therefore, the City would like to request clarification on how the air quality and noise benefits will be achieved?	While Taxiway November will remain in operation, the larger aircraft that require Runway 22L for departure will no longer need to queue on Taxiway November with the Runway 22R departures, reducing both the number and the size of aircraft using this taxiway.
37.71	Alternatives	Taxiway Improvements	The DEIS/R also claims that the Centerfield Taxiway will reduce delays for aircraft en route to Runways 22R/L for departure. Although this could occur if a minimal number of aircraft are on the field, the City questions how this benefit would be accomplished during peak periods of operation, when the number of aircraft movements on the airfield increases substantially?	Refer to response to Comments 37.64 and 37.68. The number of aircraft on the taxiways is directly related to the capacity of the runway system, since every departing or arriving aircraft must use the taxiway to get to or from the terminal. The Centerfield Taxiway will not change the taxiway demand. The delay benefits will be realized during high demand situations when Runway 22L departures are able to bypass the queue for Runway 22R. Some larger and heavier aircraft (which generally produce more noise and emissions) cannot use Runway 22R for departure but under current conditions must wait in the queue with other departures on Runway 22R, thereby increasing environmental impacts. Even though the queue on Taxiway November is limited to four jets, the heavy jets in this queue produce noise and air quality impacts that could be avoided if they could proceed directly to Runway 22L via the Centerfield Taxiway.
37.72	Alternatives	Taxiway Improvements	If the motivation behind this taxiway is to open gate space by increasing queues on taxiways, allowing Massport to reduce the so-called "delays" occurring now, then this plan is clearly a capacity enhancement program for Logan.	The purpose of the Centerfield Taxiway is not to open gate space, but to reduce taxiing delays and congestion and to provide environmental benefits. The taxiway modeling reflects delays from taxiway congestion and aircraft movements.

Code	Topic 1	Topic 2	Comment	Response
37.73	Purpose and Need	Delay	The City questions Massport's representations of delays...Missing from any discussion or evaluation of delay is the role of other airports in delaying flights destined for Logan and problems with equipment or personnel, both at Logan and other airports....Delays due to cargo and small commercial and private aircraft must be a significant factor in delay. This suggests to us that delay must be evaluated in a regional context as these are the types of flights most easily accommodated at other airports. Future air passenger surveys should include questions about the passenger's origin and the timeliness of the flight(s) leaving the city of origin or that they traveled on prior to reaching Logan.	The Airside Project deals with delays at Logan Airport and the airport's ability to address them; hence delays caused by conditions at other airports, equipment failures, and personnel problems are not relevant nor are they included in the analysis. The delays caused by cargo, general aviation, and commuter aircraft are included in the analysis and the range of the various forecasts encompasses the impacts that may occur from development of and diversion to other airports or regional transportation modes. Chapter 2 of the Supplemental DEIS/FEIR discusses Logan Airport in a regional transportation context. As the second most delayed airport in the nation for arrivals, Massport is trying to reduce its airside-related delay at Logan Airport. Refer to Chapter 1 of the Supplemental DEIS/FEIR for a discussion of Logan Airport delays caused elsewhere in the system.
37.74	Alternatives	Peak Period Pricing	Massport's recommended project alternative does not include peak period pricing. In its analysis of this administrative option, Massport assumes that some existing aircraft operations would be discontinued by a shift to off-peak hours or cancellation of the service altogether. A scenario in which airlines would move service to a regional airport is not mentioned, as if it were not a viable option. Also neglected is a plan in which airlines would continue to offer flights at peak times but would add a surcharge to the fare to make up for the peak assessment. ... Massport's rejection of [the peak period pricing] alternative is unsupported by the arguments outlined in the DEIS/R.	Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport. Regional carriers that provide service between the Cape Cod and Island markets and Logan Airport are not likely to shift these services to other regional airports because doing so would reduce the number of passengers and the economic viability of such services. Regional carriers serving Logan Airport carry a mix of local and connecting passengers. As the largest city in New England, the Boston metropolitan area represents the largest concentration of demand for outlying regional carrier markets.
37.75	Environmental Review Process	Public Process	The City found that the information Massport chose to highlight from two of the cited studies, the SAR (Strategic Assessment Report) and the Second Major Airport Siting Study (SMA), did not fully represent the conclusions of those studies as they would affect Logan. The same is true for the way in which Massport now portrays the motivations for and conclusions of these studies in public Airside Improvements presentations.	Massport disagrees. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR accurately reflect the conclusions of these studies.

Code	Topic 1	Topic 2	Comment	Response
37.76	Purpose and Need	Airfield Capacity	According to the SAR, renewed interest in the long dormant Runway 14/32 proposal grew out of a "Capacity Delay Task Force." But Michael Dawson, a private aviation consultant, in a letter to Massport correcting errors in the report, claimed that the correct name for this group was actually the "Airport Capacity Enhancement Task Force." This is an important distinction, because if Runway 14/32 is in reality a capacity enhancing measure, then the rationale for the runway contradicts Massport's recent statements. It may also violate the Supreme Judicial Court injunction that prohibits the airport's expansion.	The correct title of the report is the *Boston Logan International Airport Capacity Enhancement Plan.* It documents work by the Boston Airport Capacity Design Team (also referred to as the Task Force) which FAA established as part of its national effort to reduce delays in the NAS. The Task Force included key members from the FAA, Massport, and the airline community. The FAA has sponsored over 30 such teams, which "work to develop a coordinated action plan for reducing airport delay" (refer to Page 15 of the *Boston Logan Capacity Enhancement Plan*, produced in October 1992 by the FAA). The report recommends ways to accommodate 1992 and projected demand levels with an acceptable level of delay and without compromising safety or the environment. Runway 14/32 would not increase the normal operating capacity of the airport. Logan Airport can currently handle 120 hourly operations, and if the runway is constructed, that will still be the normal capacity throughput. Runway 14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. With a third available runway, controllers are able to segregate large and small aircraft operations, which leads to significant delay reduction benefits. Similar three-runway configurations exist for all other operating directions.
37.77	Alternatives	Peak Period Pricing	Peak hour travel time at Logan is a limited resource. Until Massport and a consortium of other public entities can expand capacity at alternative airports within the region, the immediate solution for relieving delays at Logan is to ration the existing resource through demand management policies.	The Airside Project analysis indicates that PPP is an effective option when airline's schedule beyond the normal hourly operating capacity of the airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
37.78	Alternatives	Demand	The proposed new Runway 14/32 will precipitate increased passenger volumes with consequent increases in vehicle-miles traveled. In the past, Massport has cloaked airside improvements under the veil of improved management of existing aircraft operations. But, clearly, 14/32 is different and will facilitate a new round of added air service and increases in vehicle traffic on the roads, both locally and regionally.	The construction of unidirectional Runway 14/32 would not increase Logan Airport's normal airfield capacity of 120 operations and will not generate additional aircraft operations or passenger traffic. Refer to response to Comment 37.18 and 37.76.
37.79	Alternatives	Peak Period Pricing	Massport claimed that it can seek to remove the injunction against capacity enhancing improvements for "reliever" purposes. If this is actually the case, the City questions why Massport has not pursued demand management policies such as peak hour pricing for relief.	Massport acknowledges the existence of an agreed injunction prohibiting only the completion of a Runway 14/32 concept and certain other airfield improvements proposed in the early 1970s. The express terms of this injunction, however, allow future improvements under certain circumstances, (*e.g.* changed conditions) or, more generally, if application of the terms of the injunction on a prospective basis is no longer equitable. The Airside Project Feasibility Study, Draft EIS/EIR, and Supplemental DEIS/FEIR examine Logan Airport's current and prospective operating environments and a wide range of alternative improvement concepts, including specifically, PPP. The improvement concepts have been compared to the No Action Alternative. The selection of the Preferred Alternative is based on the operating and environmental analysis set out in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. Massport has not made any claim or assertion to the contrary.
37.80	Alternatives	Runway 14/32	Constructing a new runway is only a short-term approach and will do little to solve the expanding regional transportation issues that must be addressed through a comprehensive, regional, inter/multi-modal solution.	Refer to response to Comment 37.1.

Code	Topic 1	Topic 2	Comment	Response
37.81	Regional Transportation	Regional Airports	Massport claims to be "actively engaged in promoting the use of alternative travel choices to provide relief to Logan." Massport talked about relieving congestion at Logan by expanding use of the state's regional airports in Worcester and New Bedford. Yet, after years of talk and so-called plans, Worcester and New Bedford carry the lowest number of passengers of the eight New England regional airports examined in the Regional Air Service Study. ... There has been no aggressive service development at Worcester, Hanscom or any other regional airport in Massachusetts, even though Massport claims that "The regional alternatives to Logan Airport are an important component of Massport's plan for reducing delays at Logan" (EIS/R 2-48). ... Massport's unsuccessful record in diverting traffic to other airports makes the City doubt Massport's claim of promoting regional alternatives.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
37.82	Regional Transportation	Regional Airports, Cargo	The City notes that the DEIS/R does not include any discussion of the diversion of cargo to off-airport alternatives and, thus, does not comply with the Secretary's Certificate on the ENF.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act..." Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The potential diversion of cargo operations was not specifically analyzed because cargo operations account for only two percent of aircraft activity at Logan Airport and since most all-cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.
37.83	Ground Transportation	Access to Logan Airport	Essential to the success of distributing air traffic within the region is the development of a comprehensive, inter- and multi-modal transportation system. Such a system should address not only the diversion of passengers from air service but should ensure that travelers have convenient vehicular, private and public transit access to regional transportation hubs...in order to minimize air quality impacts, incentives should be offered for the use of alternative fueled vehicles.	The Airside Project does not result in additional demand for ground access services. Massport is working with the MBTA to improve transit access to Logan Airport via the Blue Line and the Airport Intermodal Transit Connector (AITC). Section 2.7 of the Supplemental DEIS/FEIR discusses the proposed MBTA improvements in transit access to Logan Airport. *The Logan Airport 1999 ESPR* (previously GEIR), filed on December 15, 2000, also reports on the status of these ground transit improvement projects. Section 2.9 of the Supplemental DEIS/FEIR discusses the impact of planned ground access improvement projects at Logan Airport and the regional airports on passenger traffic levels and high-speed rail passenger diversion estimates.
37.84	Analysis Assumptions	Forecasts	The City recommends that data that distinguish between commuter, charter and other regularly scheduled non-commuter flights be part of the evaluation of regional air transit.	All the Airside Project forecasts included activity by segment: Jet, Regional Non-Jet, Charter Jet, Cargo Jet and Non-Jet, and General Aviation Jet and Non-Jet.

Code	Topic 1	Topic 2	Comment	Response
37.85	Regional Transportation	Regional Airports	Hanscom's potential as a regional facility has been ignored in the DEIS/R and should have received substantial attention in the alternatives analysis... Massport has not invested the funds necessary for infrastructure improvements that would attract cargo and regional service...Hanscom could be upgraded into a first-class destination for General Aviation activity with facilities that would entice many private entities to make the switch. In combination with Peak Period Pricing at Logan, Hanscom could well become a convenient option for many travelers. Hanscom could also be developed into a Northeast hub airfield offering service to major destinations such as New York, Washington, D.C., Philadelphia, Pittsburgh, Cleveland and Detroit. ...Developing Hanscom as a feeder facility for flights within the Northeast could result in a reduction in Logan's flight operations significantly. Finally, extending the MBTA's Red Line from Alewife to Hanscom should be considered as an access option as should a connection with the Fitchburg Commuter Rail line that now stops in Lincoln and Concord.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field, consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.
37.86	Regional Transportation	Regional Airports	Although Worcester may not serve as a primary reliever for Logan, it is fundamental that improved access, preferably off Interstate 90, be addressed first and foremost when planning to expand operations at this facility.	MassHighway is analyzing alternative routes that would improve surface access from Routes I-90 and I-290 to the Worcester Regional Airport. MassHighway filed an ENF in December 1999 and is in the process of preparing a Draft EIS/EIR, which is expected to be filed in October 2001.
37.87	Regional Transportation	Regional Airports	The City believes that evaluation of Fort Devens' potential role in a regional transportation system should be assessed.	Fort Devens was an alternative considered as a potential airport site in the Second Major Airport Site Selection study conducted in 1991 by the Massachusetts Aeronautics Commission. However, Fort Devens was not selected. The site has since been developed for other uses. Development at T.F. Green/Providence, Worcester Regional and Pease International Tradeport has superseded the need for a second major airport.
37.88	Mitigation	Initiatives	The DEIS/R, like other Massport project documents, does not adequately address the very real problems and needs of those most affected by airport operations on a daily basis...the quality of life of those who live and work in Logan's zone of impact is clearly not acknowledged.	Massport is committed to a number of mitigation measures in addition to project-specific mitigation. Refer to Chapter 8 of the Supplemental DEIS/FEIR for a discussion of mitigation measures.

Code	Topic 1	Topic 2	Comment	Response
37.89	Open Space/ Parkland	Impacts	The DEIS/R states that, due to the airside improvements project, areas such as parkland, farmland and cultural resources will not receive impacts or will receive insignificant impacts. This is inaccurate and one example is the projected increase in flights over Franklin Park. This parkland is an important resource in a dense urban area populated by many people of color and is on the National Register of Historical Places.	Section 6.3.3 of the Supplemental DEIS/FEIR summarizes the additional analysis of parklands relative to the Preferred Alternative. As depicted in Figure 6.3-4, Franklin Park is well outside the 65 dB Day-Night Sound Level contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on this National Register property.
37.90	Analysis Assumptions	Forecasts	The base year in the DEIS/R for modeling and forecasting is 1993, six years ago. Given the changes in fleet mix and other baseline conditions, 1993 is an inappropriate base year. Projections for 1999 are inappropriately called "near-term" rather than 'current activity' and the year 2010, only 11 years in the future, is called "long term." The DEIS/R short- and long-term time horizons do not conform with generally accepted planning practices or with FAA standards. The result is an analysis that relies upon outdated information and inadequate forecasting. At a minimum, planning and forecasting for this project should carry through the year 2020.	Consistent with the request made by EOEA in its Certificate, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport is not expected to reach the 29 million passenger forecast presented in the Airside Project Draft EIS/EIR until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is not expected to achieve the 37.5 million passenger forecasts until 2015, and the 45 million passenger forecasts will not be achieved until 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts.
37.91	Purpose and Need	Airfield Capacity	There are questions about Logan Airport's long-term capacity to serve growing air traffic demand in the region, particularly the growing territory beyond Route 128;	With recent service developments, Manchester and T.F. Green/Providence airports, are becoming attractive options for air passengers that originate in communities north and south of Routes I-95 and I-495. By its agreement to assume operational responsibility and the eventual ownership of the Worcester Regional Airport, Massport is working to increase air services at Worcester Regional Airport and is working to increase the airport's role in accommodating air travel demand generated in communities west of I-95 and I-495.
37.92	Ground Transportation	Access to Logan Airport	There are questions about whether already congested urban highways can absorb larger volumes of suburban traffic;	Refer to response to Comment 37.17.
37.93	Ground Transportation	Access to Logan Airport	...commuters who will share the roads with Logan's passengers and residents of surrounding communities who will share the air deserve an accounting of the environmental and economic costs of more traffic congestion and delays on urban roads;	Refer to response to Comment 37.17.

Code	Topic 1	Topic 2	Comment	Response
37.94	Purpose and Need	Delays	There are questions about genuine causes of delays at Logan other than northwest winds, such as the inability of airlines to find attractive alternative airports in the region; if delays actually stem from airlines scheduling far more flights than Logan is capable of handling, then adding capacity will not solve the problem...The only real solution is to improve other airports as more attractive alternatives for the airlines...	Airline services in New England are concentrated at Logan Airport because Boston is the region's most populous city and generates the most air travel demand. The regionalization of aviation in New England is currently underway. In fact, since 1996, eight out of ten new passengers in New England have used the regional airports instead of Logan Airport. Refer to Sections 2.3 through 2.6 of the Supplemental DEIS/FEIR for a discussion of the emerging roles of the Logan, T.F. Green/Providence, Worcester Regional, and Manchester airports in the regional system.
37.95	Alternatives	Peak Period Pricing	There are questions about Logan's high volume of small planes that could be accommodated at smaller, regional airports; some 45% of Logan's flight capacity is planes with 40 passengers or less;...Logan can reduce this percentage through market mechanisms geared to relieve congestion, such as peak pricing;	The Airside Project analysis evaluated PPP as a demand management measure for reducing delays caused by airline overscheduling, such as that experienced at Logan Airport in 1993. Since 1993, regional carriers operations at Logan Airport have declined by 25 percent through market mechanisms without any intervention by Massport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
37.96	Regional Transportation	Regional Airports	There are questions about the suitability of alternative airports or the readiness of alternative regional airports to handle increased traffic and meet demand projections; the effects of physical improvements to existing airports, ground access infrastructure, as well as improvements to Logan Airport need to be studied in a regional context, not in isolation.	Refer to Section 2.9 of the Supplemental DEIS/FEIR for a summary of existing ground access projects that will benefit the regional airports and to Appendix B of the Supplemental DEIS/FEIR for a summary of environmental impacts of the regional airports.
37.97	Regional Transportation	Regional Airports	There are questions about the need to preserve available sites for potential airfields; with Logan at capacity, the state needs to reexamine the suitability of Fort Devens for a new regional reliever airport to serve growing demand along the I-495 and Route 128 corridors;	Refer to response to Comment 37.87. Massport is not aware of any state initiatives to re-examine the suitability of Fort Devens. The development at T.F. Green/Providence and Manchester airports and Massport's role in Worcester Regional Airport have superceded the need for a second airport.
37.98	Regional Transportation	Regional Airports	There are questions about the regional economic benefits of airport expansion and infrastructure improvements at all facilities in the region.	The regionalization of aviation in the eastern Massachusetts, Rhode Island, and New Hampshire region is underway. The T.F. Green/Providence and Manchester airports are experiencing tremendous growth in passenger volume because of the entry and expansion of low fare carriers such as Southwest Airlines, MetroJet, and Delta Express. This strong growth at the regional airports should relieve traffic growth pressures at Logan Airport, both currently and well into the future. On January 15, 2000, Massport assumed the operational control of Worcester Regional Airport, located west of Boston, in an effort to establish a third significant regional airport for accommodating future growth in air travel demand. While these developments are important, improvements at Logan Airport are an equally critical element of the regional transportation strategy and would produce immediate benefits for area travelers. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of the role of options to Logan Airport and steps Massport has taken to foster increased use of these alternatives.
37.99	Purpose and Need	Delays	There are questions about whether prohibiting a new runway at Logan would actually have any undesirable consequences to the efficiency of Logan's operations or the region's economy.	The delay analysis presented in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR clearly indicates that delays will increase in the future if Runway 14/32 is not built. Section 1.2 of the Airside Project Draft EIS/EIR and Section 1.5 of the Supplemental DEIS/FEIR discuss the importance of Logan Airport to the regional economy. Refer also to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of the delays that would occur under future scenarios if no actions were taken, and the delay reduction benefits of the Preferred Alternative.

Mavank\D0746\Documents\Renumbered Comments & Responses\Comments 1&.doc

Code	Topic 1	Topic 2	Comment	Response
37.100	Alternatives	Runway 14/32	The runway is a violation of Massport's commitments that [air] traffic at Logan would not grow.	Massport has made no such commitment. The analysis in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR indicates that with the Preferred Alternative, Massport can accommodate existing and foreseeable future demand efficiently and responsibly.
37.101	Regional Transportation	Regional Airports	The only solution is for the Commonwealth to get serious about a regional solution to a regional problem. The runway is not a regional solution. It is a short-term quick fix for an agency that shows an incredible lack of regional vision. An agency with no long-term plans for what to do after Logan fills up again.	Regional initiatives to improve the efficiency of the region's inter-city transportation network have been studied since 1989. Section 2.9 of the Supplemental DEIS/FEIR summarizes relevant planning studies and their major conclusions. A regional transportation strategy that includes the expansion of regional airports, the development of high-speed rail, and the construction of Runway 14/32 and other infrastructure improvements at Logan Airport has evolved from these important studies. All the major improvements to the regional transportation system have been implemented except for improvements to Logan Airport's airfield. The regional airports have been experiencing tremendous growth in services and passenger traffic since 1996 and Amtrak introduced its high-speed Acela train service between Boston and New York in December 2000. Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. While greater use of the regional airports and high-speed rail will provide relief to Logan Airport, the proposed Airside Project provides clear benefits at current, as well as future, traffic levels. The benefits will only increase in the future, even as regional transportation developments act to reduce the rate of future growth at Logan Airport.
37.102	Regional Transportation	Regional Airports	The Commonwealth could capture economic growth that will be drawn to an alternative airport only if it builds another major airport to serve the region, or expands existing airports like Hanscom Field. Hanscom is in the best position to serve growing businesses along Routes 128 and 495.	Because the development of a second major airport would require ten to 15 years for site selection and environmental review, in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Hanscom Field's potential service area overlaps with the service areas for several airports that already have the necessary infrastructure for commercial service. These airports are the Hanscom Field, T.F. Green/Providence, and Worcester Regional, all which have had or are undergoing major improvements to their terminal buildings, other landside facilities and airfields.
37.103	Alternatives	Runway 14/32	A new runway at Logan will only mean more congestion and delays on our highways. Those delays will mean lost time, lost productivity, and a loss of quality of life. ... Adding more traffic to congested highways will only weaken our quality of life—and our regional economic advantage.	The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Refer to section 4.2 of the Supplemental DEIS/FEIR.
37.104	Regional Transportation	Regional Airports	Massport has no serious plans for what to do when Logan reaches its new capacity. And until Massport gets serious about a regional solution to a regional problem, the people of Boston cannot take Massport's commitments seriously at all.	Refer to response to Comment 37.101.

Code	Topic 1	Topic 2	Comment	Response
37.105	Regional Transportation	Regional Airports	The most serious delays at Logan are caused by the lack of attractive alternative airports in greater Boston for airlines and consumers. Without appealing alternative options, more traffic will continue to go to Logan. But Logan can only accommodate so much.	Refer to response to Comment 37.94.
37.106	Ground Transportation	Access to Logan Airport	More traffic at Logan will only mean more cars, trucks and shuttle buses on our congested highways and urban road system.	Refer to section 4.2 of the Supplemental DEIS/FEIR.
37.107	Regional Transportation	Regional Airports	For years, Massport planners have talked about relieving congestion at Logan by building a second major airport or expanding the use of the state's regional airports in Worcester and New Bedford ... Yet, after years of talk and so-called plans, Worcester and New Bedford carry the lowest number of passengers of all of New England's ten largest regional airports.	Refer to response to Comment 37.102.
37.108	Environmental Justice	Impacts	I am concerned that the Massachusetts Port Authority, the US Transportation Department and the FAA Logan Airside Improvements Planning Project, DEIR/DEIS, have not taken into consideration the health of Boston residents in their Logan Airport expansion plan. This is particularly worrisome because of the potential impact on some of the City's most vulnerable subpopulations who are already disproportionately affected by negative environmental factors. Furthermore, the failure to consider such matters appears to be out of compliance with President Clinton's Executive Order 12898.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to Logan Airport.
37.109	Alternatives	Preferred Alter native	The DEIR/DEIS claims that environmental impacts resulting from emissions, noise and odor are negligible or within established state and federal guidelines/ standards. We question this conclusion.	Refer to Section 5.2.4 and Section 5.4.1 of the Supplemental DEIS/FEIR for a discussion of the federal threshold for noise compatibility standards for residential land uses and the state and federal air quality standards. Also, refer to Section 6.2 and Section 6.4 of the Supplemental DEIS/FEIR for a discussion of the noise and air quality impacts, respectively, of the Preferred Alternative relative to federal and state standards.
37.110	Noise	Sound Insulation	The DEIR/DEIS proposes to use soundproofing to mitigate noise impacts in certain neighborhoods. The process of soundproofing residences and businesses can create indoor air quality problems. ...There is no acknowledgement of such secondary impacts in the DEIR/DEIS.	Sound insulation is a widely accepted and popular form of noise mitigation. Neither Massport nor the FAA is aware of secondary impacts that would alter the recommended practice.
37.111	Noise	Studies	Noise and odor impacts have been associated in some studies with decreased learning and increased aggression. In Boston's neighborhoods affected by the redirection and new traffic which will result from this project, decreased learning and increased aggression are issues of concern which should also be addressed.	There is no consensus of these effects within the scientific community. Massport will continue its attempts to reduce instances of highest noise exposure first. The greatest benefit of Runway 14/32 would be the reduction of noise to those most impacted by noise. It would shift 75,000 flights over water, while reducing total number of nighttime flights.
37.112	Public Health	Effects	The BPHC (Boston Public Health Commission) strongly recommends that Massport, the US Transportation Department and the FAA commission the appropriate studies that will document whether or not there are real health impacts on affected Boston neighborhoods associated with the proposed Logan project.	Refer to response to Comment 37.15.

Code	Topic 1	Topic 2	Comment	Response
37.113	Regional Transportation	Regional Airports	There needs to be a regional approach to resolving the current problems at Logan Airport. We firmly believe that the solution to these problems cannot be solved solely by improving conditions only at Logan. ... In our opinion, both the State and Federal governments have the obligation to devise a strategy to encourage and to ensure that a much higher percentage of the burden at Logan is relieved by regional commercial airports.	Since 1990, there have been several studies that have recommended regional initiatives to improve the efficiency of the region's inter-city transportation network. These studies reflect the cooperation of federal, state and local transportation agencies and stakeholders. Section 2.9 of the Supplemental DEIS/FEIR summarizes relevant regional planning studies and their conclusions. All studies have concluded that the Proposed Runway 14/32 and the other airside improvement projects at Logan Airport, along with increased use of the regional airports, including T.F. Green/Providence, Manchester and Worcester Regional airports, and high-speed rail services, are necessary for accommodating the region's future inter-city air travel demand. Refer to discussion of the role of regional alternatives and steps Massport has taken to foster increased use of these alternatives in Chapter 2 of the Supplemental DEIS/FEIR.
37.114	Environmental Review Process	Blue Ribbon Panel	We want to express our support of the proposal of Mayor Menino that an independent commission, or "blue ribbon panel" be established to study objectively the opportunities for regional air traffic improvements and the environmental and economic impact of further expansion at Logan.	Refer to response to Comment 37.1.
37.115	Regional Transportation	Regional Airports	We support the Mayor's suggestion that a regional New England Port Authority be established to implement a regional transportation strategy, replacing the limited focus of Massport.	This is a matter for the United States Congress and individual state legislatures.
37.116	Regional Transportation	Regional Airports	Regional airports offer a highly feasible resource to attract a large proportion of demand from Logan. Manchester and T.F. Green Airports, for example, already are demonstrating their ability to act as major alternatives to Logan ... We are especially pleased that Massport recently announced plans to take over operations, and eventually ownership, at Worcester Municipal Airport. This is a first step in the right direction to develop a regional solution to Logan's capacity and delay problems. In the meantime, we strongly urge Massport to put the same energy in promoting and developing the use of Worcester as an alternative to Logan as it has in developing the Airside Improvements Project.	Massport considers Logan Airport to be part of a regional system of airports that includes the T.F. Green/Providence, Worcester Regional and Manchester airports. Service developments and increased traffic at these airports are a component of the region's long-term strategy to accommodate passengers and activity growth. By its agreement to assume operational responsibility and the eventual ownership of Worcester Regional Airport, Massport is working to increase air services at Worcester Regional Airport and its role in accommodating air travel demand generated in communities west of I-95 and I-495. Greater use of the regional airports will relieve traffic growth pressures at Logan Airport, but will not eliminate the need for the Airside Project.
37.117	Purpose and Need	Delay	We believe that the delay data and analysis used by Massport to support its proposals, especially the new Runway 14/32, is highly questionable and overstates the actual problem.	The FAA consistently rates Logan Airport as one of the most delay-prone airports in the United States. Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. The FAA Technical Center simulated Logan Airport operations in 1992 and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Supplemental DEIS/FEIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29 M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates with those of the Airside Project modeling. The FAA has concluded that the Airside Project delays represent "a plausible and conservative estimate".

Code	Topic 1	Topic 2	Comment	Response
37.118	Delay	Model	We believe that Massport's analysis basically is flawed for several reasons. First Massport chose to develop its own model. Further, Massport based its model on data from 1993, a peak year for delay at Logan, rather than averaging several years of data. ... FAA statistics on delay at Logan since 1993 have indicated an approximate 19 percent decrease in delays between 1993 and 1998, ... In sum, we feel that the data and methodology used by Massport to calculate existing and future delay do not realistically portray the normal operation of a major U.S. airport and overstate a problem in order to support a pre-conceived program of airside improvements.	Massport developed or modified various models used in this Supplemental DEIS/FEIR to account for truly unique aspects of this project. For example, no other airport in the world has a runway advisory system as sophisticated as PRAS; no other airport in the world has adapted an existing noise prediction model to account for over-water sound propagation (to the extent it is a problem at other locations, it has been ignored); and no other airport in the world has addressed the noise from aircraft taxi movements in as comprehensive a manner as this. The FAA and Massport believe the resulting analyses presented in Chapter 4 of the Supplemental DEIS/FEIR are thus more informative than they would be using only standard models. Separately, the existing environment has been updated in this Supplemental DEIS/FEIR to reflect 1998 operations.
37.119	Noise	Studies	Prior to the construction of the proposed improvements, we recommend that Massport conduct a Federal Aviation Regulations (FAR) part 150 noise compatibility study, which would set forth measures to be taken by Massport to reduce incompatibility in land uses and prevent additional incompatible land uses in the vicinity of Logan Airport.	Massport has implemented numerous noise mitigation measures over the years and continues to pursue a variety of innovative solutions to its noise problems. Massport has no authority to direct land use outside Logan Airport's boundaries.
37.120	Noise	Studies	A Part 150 study, in turn, would trigger an FAR part 161 study for a program of noise abatement and restriction, which could provide for a voluntary control of the number of flights to Logan through agreements between Massport and the airlines serving the airport.	A Part 150 study does not necessarily trigger a Part 161 study. Massport has implemented numerous noise mitigation measures over the years and continues to pursue a variety of innovative solutions to its noise problems.
37.121	Alternatives	Other Non-Construction Alternatives	We believe that limiting or restricting uncontrolled growth of operations at Logan is imperative and could serve as an alternative means to reduce the current and projected future flight delays. ... Eliminating or consolidating flights to provide higher load factors than presently exist would, in turn, not only reduce the number of operations and maximize airline revenue, but also result in delay reduction.	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.
37.122	Noise	PRAS	We feel that a fair and equitable distribution of aircraft operations can be achieved through alternative measures and without the construction of a new runway. We recommend that Massport officials work with FAA tower personnel to examine the PRAS program to determine whether there may be changes to the program that would result in a superior noise abatement policy to that currently in place.	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.

Code	Topic 1	Topic 2	Comment	Response
37.123	Alternatives	Runway 14/32, Peak Period Pricing	[In comparing Preferred Alternative 1A vs. Alternatives 2 and 3] [o]nly under the 37.5 million Low Fleet scenario, where non-jet, commuter operations represent a smaller share of the fleet serving Logan, would construction of Runway 14/32 alleviate a greater share of the delay. Thus, if a High Fleet scenario develops at Logan, the construction of Runway 14/32 becomes more of a hindrance and is no longer effective without additional mitigation measures.	Table 4.5-3 in the DEIS shows that the reduction in annual delay hours under the 29 M Low Fleet, 37.5 M Low Fleet, and 29 M High Feet scenarios would be greater with Runway 14/32 than with PPP. Under the 37.5 M and 45 M High Fleet scenarios, PPP provides a greater delay reduction (Alternative 1A compared Alternative 3) but the percentage delay reduction with the new runway is greater than under each of the Low Fleet scenarios. The results demonstrate that Runway 14/32 would provide benefits under all the future forecasts, while the PPP benefits are much more significant under the High Fleet scenarios than under the Low Fleet scenarios. The results for the new 37.5 M High Regional Jet Fleet in Table 4.7-2 of the Supplemental DEIS/FEIR are similar to those of the Low Fleet scenarios in terms of the relative benefits of the alternatives. Recent history suggests that the Low Fleet forecasts seem to represent the more likely future scenario. If future conditions do trend towards the High Fleet scenarios, the new runway would still provide major delay reductions, and the addition of PPP would further help to reduce delays. This is because the runway would primarily address northwest wind delays; while PPP addresses airline overscheduling with flight cancellations. Additional analysis of PPP is set out in Section 4.5 the Supplemental DEIS/FEIR.
37.124	Regional Transportation	Regional Airports	This analysis also points to another problem. Since the High Fleet assumes a mix with significant regional operations at Logan, an improvement could only occur if there is a substantial transfer of the regional operations from Logan to other airports, as we have recommended above.	The fleet forecasts address a wide range of scenarios, and the High Fleet results seem less probable given current conditions. However, this does not affect the benefits of the proposed runway. Runway 14/32 would reduce delays by at least 27 percent under any of the fleet conditions. In all cases, the delay reduction benefits of the runway would be clearly substantial. Regional carriers are not likely to shift operations to regional airports because doing so would likely reduce on-board passengers and the economic viability of the service. Regional carriers at Logan Airport carry a significant number of local passengers traveling to the City of Boston and passengers connecting to other flights at Logan Airport that are not available from the regional airports. For example, service to Manchester Airport would not be a viable alternative for a Provincetown passenger traveling to a location in downtown Boston. Likewise, regional service to T.F. Green/Providence Airport would not be attractive to a Bangor passenger trying to reach Denver, since there are no nonstop services between Providence and Denver. Additional analysis of PPP is set out in Section 4.5 the Supplemental DEIS/FEIR
37.125	Noise	Runway 14/32	Implementation of Runway 14/32 will result in substantial noise impacts on many of the greater Boston area communities. ...Overall, implementation of Runway 14/32 would widen the scope of communities exposed to noise levels equal to or greater than 65 dB by 2 percent, over the other alternatives.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
37.126	Alternatives	Runway 14/32	It is our understanding that Massport will not agree to any legally binding agreement to maintain the unidirectionality of this runway in perpetuity.	Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.
37.127	Alternatives	Runway 14/32	We also have some concerns with the type of aircraft that would use Runway 14/32. ... It appears that Massport intends greater use of Runway 14/32 for larger jets than it has presented in the Draft EIS/EIR, having categorized the runway as essentially a commuter runway.	Unidirectional Runway 14/32 would be principally used by regional non-jets, general aviation and small jet aircraft capable of landing or taking off in 5,000 feet. Appendix E of the Airside Project Draft EIS/EIR contains the fleet mix for each scenario. Design Category C-III indicates the highest approach speed and widest wingspan of the aircraft to use the runway. Approach Category C includes those with speeds from 121 to 140 knots; Design Group III designates wingspans from 79 to 117 feet. Several of the general aviation and commuter aircraft have approach speeds or wingspans in these ranges.
37.128	Alternatives	Runway 14/32	Although according to Massport the maximum available capacity is 120 operations per hour (with a 3-runway configuration), this capacity is available only about 80% of the year. With Runway 14/32, actual capacity, and thus the number of operations, would increase to more closely approach 100% use.	The availability of unidirectional Runway 14/32 would provide a third runway for use during northwest wind conditions. The runway will not increase the airfield's normal operating capacity of 120 operations per hour and will not generate additional aircraft operations.
37.129	Alternatives	Taxiway Improvements	We seriously question the safety of proposing a taxiway between two busy runways, which we believe could be a problem for a pilot who, on approach to either runway, is not familiar with Logan Airport or when there is extremely low visibility.	Refer to response to Comment 37.69.
37.130	Alternatives	Taxiway Improvements	Since neither the FAA nor Massport would agree to limit the number of aircraft which could use the Centerfield Taxiway, the number of aircraft which could approach this end of the airport would be very high, and would be added to those aircraft using Taxiway November....Since Taxiway November is 3,800 feet in length, the number of aircraft requesting permission to use the Centerfield Taxiway could nearly triple. With a large number of aircraft using the Centerfield Taxiway, there obviously would be a substantial increase in noise, air pollution, and odor impacts on the Bayswater section of East Boston, which is located opposite the proposed alignment of this taxiway. These impacts especially would occur during the summer months, when southwesterly winds are the most common in Boston. Accordingly, we would seriously question Massport's claim to air quality and noise benefits of constructing the Centerfield Taxiway.	The taxiway improvements are designed to improve ground movement efficiency and safety, and to reduce taxiing delays; thereby reducing associated noise and emissions. When using Runways 22L/R for departures, the Centerfield Taxiway would provide an alternate taxi route for Runway 22L departures to bypass the queue for Runway 22R, thereby reducing taxiway congestion and associated noise and emissions. Runway 22L departures represent less than ten percent of the total departures. Under existing conditions, aircraft needing to depart on Runway 22L (typically heavy jets, such as 747s with long takeoff distance requirements) must wait in the queue on Taxiway November with aircraft departing on Runway 22R. With the Centerfield Taxiway, aircraft departing on Runway 22L could depart quickly after reaching the runway end, and the number of aircraft queuing on Taxiway November should decline. Also, the aircraft on the Taxiway November should be smaller, implying lower noise and air quality emissions. With the addition of Runway 14/32, use of Runways 22R and 22L for departures would decline.
37.131	Alternatives	Reduced Approach Minimums	Since arrival is the most difficult and challenging portion of a flight, our safety concerns are based on the premise that the poor weather conditions and reduced visibility, which would trigger the use of these lower landing minima, would only serve to exacerbate a pilot's workload during the landing procedure. With the high number of residents living in close proximity to the touchdown points of these runways, we believe that lowering the safety standards would leave these residents in peril and could result in a tragedy at any time...	Reduced landing minimums provide for a safer approach by providing precision guidance at lower altitudes, and thus a safer approach. The reduced landing minimums do not change the approach path nor reduce the clearance between aircraft and the surface. Rather, they shift the location at which a missed approach decision is initiated closer to the airport. For Runways 27 and 22L, the reduced minimums will make the approach procedures flown by pilots more consistent with FAA standards in effect at most other airports. Reduced landing minimums will increase airfield safety by allowing operations more directly into the prevailing wind and will help improve PRAS goal achievement.

Code	Topic 1	Topic 2	Comment	Response
37.132	Alternatives	Reduced Approach Minimums	We disagree with FAA's assertion that lowering the landing minima would result in noise benefits for the residents living under the approach paths to the subject runways. ... Lowering the landing minima potentially could result in greater use of these runways during poor weather conditions, exposing nearby residents to greater noise levels and more frequent disturbances than they currently experience.	With the proposed reduced minimums, the percentage of equivalent jet arrival operations would decrease by 0.4 percent on Runway 4 and increase by 0.2 percent on Runway 15 and 0.1 percent on Runway 22L. These small increases in arrival operations would not have a measurable effect on the Day-Night Sound Levels under the approaches. Additionally, most of the neighborhoods now exposed to the higher noise levels from power-up would experience reductions up to 10 dB because the proposed reduced minimums would shift the location of the missed approach decision toward the airport beyond most of the neighbors.
37.133	Alternatives	Taxiway Improvements	A number of taxiway improvements also are proposed...in order to reduce taxiway congestion, enhance airfield safety and facilitate operating efficiencies. ... Since these improvements are designed to enhance airfield safety by eliminating confusing or problematic alignments and intersections, we support their implementation at this time.	Comment noted.
37.134	Alternatives	Peak Period Pricing	Massport has eliminated [peak period pricing] based on a claim that airline over-scheduling is not currently a problem at Logan...and is not projected to be a problem in the near future... We do not agree with these conclusions, particularly since the Draft EIS/EIR acknowledges that under long-term High Fleet scenarios "peak period pricing could provide meaningful delay benefits by reducing airline over-scheduling that emerges as a contributor to Logan delays within these flights" (emphasis added).	Refer to response to Comment 37.26.
37.135	Noise	Model	Page 5-34 (top paragraph) – One could question the use of modeled runway use rather than actual effective runway usage in the noise analysis; does this not distort the analysis?	The only way to estimate future noise impacts is by modeling the airfield operations and runway use. The same assumptions used in analyzing the future scenarios were also applied to the analysis for 1993 to demonstrate the effects. The discussion on page 5-34 of the Airside Project Draft EIS/EIR points out the two main differences: (1) runway use in the model is based on the best attempt to meet PRAS goals; (2) year-to-year weather variations are smoothed out by averaging across ten years of Logan Airport weather observations. The 1993 analysis depicts what would have occurred if the Enhanced PRAS had been installed and its recommendations followed that year, and if the weather in 1993 had been the same as the average for 1981-90.
37.136	Ecosystems	Rare Species	Page 5-61 – Construction of the Centerfield Taxiway will displace the nesting sites of the upland sandpiper, a State-listed endangered species. The Massport mitigation plan proposes to relocate these birds off-site to Cape Cod. One could question whether a more local site would be more appropriate.	Refer to response to Comment 37.53.
37.137	Noise	Impacts	Page 6-43 (Tables 6.2-14 and 6.2-15) – The differences between alternatives are not significant or are imperceptible. (Similarly with Tables 6.2-22 to 6.2-29)	Typically, changes in Day-Night Sound Levels of 0 to 2 dB may be perceived and changes of 2 to 5 dB are generally perceived, while changes of more than 5 dB are likely to cause a change in community reaction. By these guidelines, differences between alternatives may be perceived as small, but they occur at the highest exposure levels existing around Logan Airport and are therefore important to mitigate.
37.138	Air Quality	NAAQS	Page 6-82 – 6-83 (Tables 6.3-10 – 6.3-14) – The air quality differences among the alternatives is not significant.	No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives.

Code	Topic 1	Topic 2	Comment	Response
37.139	Soil/Sediment	Reuse/ Disposal Options	Page 6-100 (Table 6.6-1) – There are errors in the mean for arsenic, chromium, and lead (see Table 5.6-2, Page 5-74).	There is no error between the two tables. The mean values for the referenced parameters differ only as a result of rounding. The two Governors Island soil characterization tables are not repeated in the Supplemental DEIS/FEIR since that material will be removed from the airfield, as part of an unrelated project, before initiation of any Airside Project construction. Section 5.7.2 of the Supplemental DEIS/FEIR describes that action.
37.140	Construction	Noise	Page 6-117 (Nighttime Construction) – Nighttime construction is scheduled for Runway 14/32, the Centerfield Taxiway, Taxiway November, and possibly elsewhere. The impact on the adjacent East Boston community (Jeffries Point, etc.) needs to be addressed (should construction proceed).	The Supplemental DEIS/FEIR includes an analysis of nighttime construction noise in potentially affected residential areas. All increases in noise associated with construction of the Preferred Alternative improvements are less than 5 dB, the Federal standard for a finding of "no impact". Refer to Section 6.9.4 of the Supplemental DEIS/FEIR.
37.141	Construction	Traffic	Page 123 – Barging, rather than trucking, should be considered for the removal of earth from the airport (also, barging in soil and construction materials) to reduce construction vehicle traffic.	The number of construction vehicles for the Airside Project has been reduced as a result of the reduction in the amount of soil material that will need to be removed from the airport. These construction vehicles represent less than 0.2 percent of the total traffic volume of the regional highway system. All contractors will be required to use designated truck routes. Barging of materials would not be practical since disposal locations for the excavated soil material and existing asphalt to be removed from the site, as well as the sources of paving materials to be brought on-site, will vary and are unlikely to be near coastal waters.
37.142	Errata		Page 8.5 (Figure 8.2-1) – This Figure is incorrect (actually it is the same as Figure 8.2-2).	The correct data for this figure can be found in Table 4.5-1 on Page 4-29 of the Airside Project Draft EIS/EIR.

Charles C. Yancey

Boston City Councillor

April 26, 1999

LETTER 38

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, 20th floor
Boston, MA 02202

Dear Secretary Durand:

I am writing to strongly oppose **Massport's 14/32 Runway Expansion Proposal.**

Massport and the FAA has argued that annual mean levels of carbon monoxide, nitrogen dioxide, particulate matter and volatile organic compounds do not have an adverse air quality impact on the Commonwealth of Massachusetts. But, their detailed analytic data reveal that cumulative noise and ambient contaminants will disparately impact the predominately low-income neighborhoods of Boston. While these impacts have been acknowledged in Chapter 6 of the Draft Environmental Impact Report/Statement (DEIR/DEIS), a regulatory loophole allows Massport not to provide soundproofing within the 65 decibel contour and other mitigation to residential property which do not comply with building code. The Massport expansion and the regulatory loophole are discriminatory. Low income property owners frequently do not have the means to bring their property up to code. Section 8.7 of the DEIR/DEIS offers a dismissive discussion of Airside Project issues relative to environmental justice and compliance with Executive Order 12898. The Commonwealth appears to have no guidance or environmental justice policy, which parallels the Federal Executive Order. However, if your office finds the Logan Expansion adequate, since Massport receives Federal funding, you and your agencies will knowingly violate Title VI of the Civil Rights Act of 1964. 38.1

I believe that the additional burden of any expansion should be equitably distributed and Massport's are not. It is clear that if we build the new runway, we are going to increase traffic on runway 27. Massport has failed to offer mitigations to any burdens that may be placed on community residents in Dorchester, Roxbury, Mattapan, East Boston, the South End, Chelsea, Winthrop and Somerville. 38.2

Massport representatives have avoided discussing the failure of their project report to comply with the Environmental Justice's Executive Order and the adverse health additional pollution that a new runway may impose on low-income Boston residents. They only focus on improving tourism and business travel in Boston. We are put in the position of looking as though this is not an either/or decision. From a political and environmental perspective, it should be both.

Region I alternatives to the Massport plan, such as providing incentives to attract air traffic away from Logan Airport to Worcester, Providence, RI, and Manchester New Hampshire, require further analysis. 38.3

Sincerely,

Charles C. Yancey
Boston City Councillor

Code	Topic 1	Topic 2	Comment	Response
38.1	Environmental Justice	Impacts	...[D]etailed analytic data reveal that cumulative noise and ambient contaminants will disparately impact the predominately low-income neighborhoods of Boston. While these impacts have been acknowledged in Chapter 6 of the Draft Environmental Report/Statement (DEIR/DEIS), a regulatory loophole allows Massport not to provide soundproofing within the 65 decibel contour and other mitigation to residential property which do not comply with building code. The Massport expansion and the regulatory loophole are discriminatory. Low income property owners frequently do not have the means to bring their property up to code.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Noise was found to be the only adverse impact from the Preferred Alternative with the potential for Environmental Justice impacts. Additional demographic analysis of the noise-affected areas was conducted to determine if minority and/or low-income populations would be disproportionately affected. This analysis found that there is no high and adverse disproportionate impact caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.

Code	Topic 1	Topic 2	Comment	Response
38.2	Environmental Justice	Impacts	It is clear that if we build the new runway, we are going to increase traffic on runway 27. Massport has failed to offer mitigations to any burdens that may be placed on community residents in Dorchester, Roxbury, Mattapan, East Boston, the South End, Chelsea, Winthrop and Somerville.	The Supplemental DEIS/FEIR indicates that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The PRAS goals were established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations. Chapter 8 of the Supplemental DEIS/FEIR summarizes Massport's proposed project-specific mitigation program associated with the Preferred Alternative including: Runway 14/32 would be designed, constructed, and operated to handle over-water operations only (unidirectional). Massport would seek to construct Runway 14/32 to reflect unidirectional use. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements. Section 2.8 of the Supplemental DEIS/FEIR discusses passenger and activity growth at the regional airports and their effect on Logan Airport's projected passenger and activity levels. With regard to ridership projections on Amtrak's high-speed rail, the Airside Project Draft EIS/EIR described in detail the best current information. No updated projections are available. Refer to Appendix B for Amtrak's letter stating that no revised ridership estimates are available. No alternatives violate the NAAQS. The Preferred Alternative shows better air quality results than the other alternatives. The *Logan Airport 1999 ESPR* (previously GEIR) reports on Massport's Alternative Fuels Vehicle program and on Massport's efforts to encourage the use of alternative fuel vehicles.
38.3	Regional Transportation	Regional Airports	Region I alternatives to the Massport plan, such as providing incentives to attract air traffic away from Logan Airport to Worcester, Providence, RI, and Manchester, New Hampshire, require further analysis.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.

LETTER 39

Robert A. Durand
Secretary of the Executive Office of Environmental Affairs
Massachusetts Environmental Protection Agency
100 Cambridge Street, Room 2000
Boston, MA 02202

Dear Mr. Durand,

I am writing to comment on the Draft Environmental Impact Statement/Draft Environmental Impact Report for the Logan Airside Improvements Planning Project as presented by Massachusetts Port Authority in Fenway 1999. I find the DEIS/DEIR to be inadequate and full of shortcomings. It should be rejected as a shortsighted and limited study.

The main thrust of my objection to Massport's DEIS/DEIR is the lack of reasonable alternatives considered in the document as is required by the National Environmental Policy Act. This Act requires the DEIS/DEIR to "rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated. No Discussion of "alternatives not considered in the DEIS/DEIR" was included. I question whether Massport followed the rules of section 1502.1 and 1502.14, which address alternatives. I have not been informed of "reasonable alternatives, which would avoid or minimize adverse impacts or enhance the quality of the human environment." I am not aware of any alternatives presented in comparative form or rigorously explored and objectively evaluated. Massport did not devote substantial treatment to each alternative considered nor included the alternative of no action. You must not accept a DEIS/DEIR that does not follow the standard format that is required. 39.1

There are many other concerns that I have with the document. The airside project and the landside projects at Logan Airport are interdependent, and both will increase capacity and stimulate demand. Yet, Massport wants you to consider landside and airside impacts separately. The cumulative impacts of these projects are immense and must be taken into account. Massport understates these impacts while overstating the delay problems at Logan by using its own model instead of using the FAA approved SIMMOD model for the airport simulation. No data is presented to show recent improvement due to the availability of Enhanced PRAS (EPRAS). In actuality, FAA data on delays shows that the delay situation at Logan has improved since 1993 and is holding steady. The FAA reported delay for 1998 was 18% lower than 1993 levels. This is not reflected in the DEIS/DEIR. This improvement has occurred without any of the airside improvements proposed in this DEIS/DEIR. 39.2 39.3 39.4

FAA legislation requires that airport sponsors conduct a benefit -cost analysis for capacity- related airport projects. The DEIS/DEIR does not indicate such an analysis. There are also no economic analyses of the noise impacts of the various alternatives. Noise related costs and benefits should be addressed in economic analyses of activities that result in increases or decreases in aircraft noise. 39.5

Furthermore, I have concerns with Massport's guarantee of unidirectional use of runway 14/32. It is clear to me that this commitment is reversible. Massport also reports that the proposed runway will be used only by regional and commuter aircraft. However, large jets such as Boeing 737,s, MDC DC-9's, and Airbus A-320's are allowed to use the runway and surely will use it. 39.6

There are unaddressed questions dealing with adverse air quality impacts associated with construction of runway 14/32 and the Centerfield Taxiway. The DEIS/DEIR does not sufficiently explore the odor impacts or the dust problems due to construction of the runway. The proposed airside improvements provide minimal long-term air quality benefits. On the other hand, The Jeffries Point Neighborhood will be adversely impacted by odor from takeoffs. 39.7 39.8

In summary, I must restate my opposition to the Logan Airside Improvements Project and ask that you judge the DEIS/DEIR to be inadequate and removed from further consideration due to its deficiencies. There is no plan or program to deal with long term growth at Logan Airport. There are measures that could be instituted to effectively address transportation in Eastern New England, but there is no discussion in this document. There must be a plan and a program to shift some current and future air traffic and passengers from Logan. Major expansion of service at and capacity of other Airports must be undertaken. The ENF Certificate dated November 22, 1995 cited that "the alternatives analysis must be broadened to include off-airport alternatives". Although Massport includes some off-airport options, the development of other obvious alternatives has not been reasonably discussed nor have the reasons for their elimination as options.

Thank you for your consideration to this important matter.

Sincerely

Paul Scapicchio

39.1	Environmental Review Process	NEPA	...my objection to Massport's DEIS/DEIR is the lack of reasonable alternatives considered in the document as is required by the National Environmental Policy Act. This Act requires the DEIS/DEIR to "rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated. No Discussion of "alternatives not considered in the DEIS/DEIR" was included. I question whether Massport followed the rules of section 1502.1 and 1502.14, which address alternatives.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
39.2	Cumulative Impacts	Landside Improvements	The Airside Project and the landside projects at Logan Airport are interdependent, and both will increase capacity and stimulate demand...The cumulative impacts of these projects are immense and must be taken into account.	Environmental and health issues within the City of Chelsea were considered in an effort to assess other cumulative or multiple adverse exposures. Refer to Section 6.8.6 of the Supplemental DEIS/FEIR for additional information.
39.3	Delay	Model	Massport understates these impacts while overstating the delay problems at Logan by using its own model instead of using the FAA approved SIMMOD model for the airport simulation.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Section 1.4 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
39.4	Delay	Model	No data is presented to show recent improvement due to the availability of Enhanced PRAS (EPRAS). In actuality, FAA data on delays shows that the delay situation at Logan has improved since 1993 and is holding steady. The FAA reported delay for 1998 was 18% lower than 1993 levels. This is not reflected in the DEIS/DEIR.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals.
39.5	Environmental Review Process	NEPA/FAA	FAA legislation requires that airport sponsors conduct a benefit-cost analysis for capacity-related airport projects. The DEIS/DEIR does not indicate such an analysis [was completed]. There are also no economic analyses of the noise impacts of the various alternatives. Noise related costs and benefits should be addressed in economic analyses of activities that result in increases or decreases in aircraft noise.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. According to 40 CFR Part 1502 Environmental Impact Statements Regarding Cost-Benefit analysis " for purposes of complying with the act, the weighing of the merit and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis..."

Code	Topic 1	Topic 2	Comment	Response
39.6	Alternatives	Runway 14/32	Furthermore, I have concerns with Massport's guarantee of unidirectional use of Runway 14/32. It is clear to me that this commitment is reversible. Massport also reports that the proposed runway will be used only by regional and commuter aircraft. However, large jets such as Boeing 737s, MDC DC-9s, and Airbus A-320's are allowed to use the runway and surely will use it.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32. Unidirectional Runway 14/32 would be principally used by regional non-jets, general aviation and small jet aircraft capable of landing or taking off in 5,000 feet. Appendix E of the Airside Project Draft EIS/EIR contains the fleet mix for each scenario. Design Category C-III indicates the highest approach speed and widest wingspan of the aircraft to use the runway. Approach Category C includes those with speeds from 121 to 140 knots; Design Group III designates wingspans from 79 to 117 feet. Several of the general aviation and commuter aircraft have approach speeds or wingspans in these ranges.
39.7	Construction Period	Mitigation	There are unaddressed questions dealing with adverse air quality impacts associated with construction of Runway 14/32 and the Centerfield Taxiway. The DEIS/DEIR does not sufficiently explore the odor impacts or the dust problems due to construction of the runway. The proposed airside improvements provide minimal long-term air quality benefits.	Massport will require contractors to retrofit their heavy construction equipment with advanced pollution control devices in accordance with DEP's Clean Air Construction Initiative. Contractor owned equipment, such as front-end loaders, backhoes, cranes and excavators, will be retrofitted with oxidation catalysts to filter and break down hydrocarbons, particulate matter and carbon dioxide from diesel emissions. Refer to Section 6.9.4 of the Supplemental DEIS/FEIR for additional discussion of air quality mitigation measures during the construction period. As stated in Section 6.9.4.2 of the Supplemental DEIS/FEIR, Massport is committed to implementing the Clean Air Construction Initiative in cooperation with MADEP and Northeast States for Coordinated Air Use Management (NESCAUM). Furthermore, construction will conform to FAA AC 150/5370-10A, *Standards for Specifying Construction of Airports.* Construction-period air quality impact mitigation will include the steps specified in FAA Advisory Circular 150/5370-10A, Standards for Specifying Construction of Airports. These and other measures are listed in Section 8.5.2 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
39.8	Air Quality	Odor	The Jeffries Point Neighborhood will be adversely impacted by odor from takeoffs.	One-hour VOC concentrations (used as an indicator of odor) increase only slightly at Jeffries Point with the Preferred Alternative, when compared to the No Action Alternative. The predicted increase is so small that changes in odor will remain imperceptible, as measured against the No Action Alternative. Concentrations decrease at all other receptors with the Preferred Alternative.

LETTER 40

The members of the Barnstable Municipal Airport Commission would like to express their support for the construction of runways 14-32 at Logan International Airport.

We recognize that many untrue and half-true statements have made headlines recently concerning this project. We wish to comment on just few of them.

The first is "NOISE" pollution. This runway cannot possibly generate any additional noise, as it is a completely over-the water approach. It may in fact reduce the existing noise generated both in the air by circling traffic and on the ground by planes waiting for departure clearance. 40.1

Then there is talk that "DELAYS" at Logan should be controlled by a device called "PEAK PERIOD PRICING." This policy would increase landing fees for all carriers wishing to use the airport at "Certain" times, when in fact, the problem is not timing but a wind/weather situation which can occur at any time. When the wind goes to the Northwest, Logan International Airport needs two runways, not one, as is the current status. This runway will be a unidirectional runway. For use only when the winds make it the safe second runway. 40.2

The residents of Cape Cod rely heavily on our Airport to get them where they need to be in an efficient manner. Logan is their departure point of choice. They are still going to go there for their through flights. If air travel is to be restricted between Barnstable and Logan during "Peak" times, then our residents will choose to be either driven to or will drive to the airport themselves. Has the impact of the additional vehicular traffic been considered? Will additional parking facilities be constructed? 40.3

Cape Cod is not the only area in the state that will be affected.

We see this runway not as the end of the story, but a first chapter in the regionalization process which is being discussed. Give the airport the safety of a second northwest runway, while alternatives for greater dispersion of traffic can be explored.

Please support this construction project.

Thank you.

Katherine A. Strojny, Chairman, Barnstable Municipal Airport Commission

40.1	Noise	Runway 14/32	This runway cannot possibly generate any additional noise, as it is a completely over-the-water approach. It may in fact reduce the existing noise generated both in the air by circling traffic and on the ground by planes waiting for departure clearance.	Comment noted.
40.2	Alternatives	Peak Period Pricing	..."PEAK PERIOD PRICING" ...would increase landing fees for all carriers wishing to use the airport at "Certain" times, when in fact, the problem is not timing but a wind/weather situation which can occur at any time.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.
40.3	Alternatives	Peak Period Pricing	The residents of Cape Cod rely heavily on our Airport to get them where they need to be in an efficient manner. Logan is their departure point of choice. They are still going to go there for their through flights. If air travel is to be restricted between Barnstable and Logan during "Peak" times, then our residents will choose to be either driven to or will drive to the airport themselves. Has the impact of the additional vehicular traffic been considered? Will additional parking facilities be constructed?	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. Boston, MA 02202

Dear Mr. Durand:

Pursuant to the request of the Cambridge City Council, I am forwarding to you the enclosed resolution submitted by Councillors Kathleen Born and co-sponsored by the entire membership. The resolution expresses the opposition of the City of Cambridge to the proposed Runway 14/32 at Logan Airport, and is intended to be considered as part of the MEPA comment process.

As you will note, all members present were unanimous in their support of this resolution.

Thank you for your attention in this matter.

Very truly yours,

D. Margaret Drury
City Clerk

Code	Topic 1	Topic 2	Comment	Response
41.1	Noise	Runway 14/32	The construction of Runway 14/32 at Logan Airport would lead to an intolerable increase in noise and pollution for neighboring communities such as Cambridge because of the increased volume of flights it would allow.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context. The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.
41.2	Alternatives	Runway 14/32	The proposed runway is a short-term short-sighted fix to the problem of delays at Logan; Massport admits that the delays will return to current levels within five years of the construction of Runway 14/32; what is needed is a realistic, long-term, regional aviation plan for New England....	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
41.3	Environmental Review Process	Public Process	...Massport has refused to come to a meeting of the Cambridge City Council or to schedule its own public meeting in Cambridge....	Since the initial scoping, FAA and Massport have established a dialogue with the Airside Review Committee, community leaders and the public through hearings, briefings, and circulation of over 700 copies of the Airside Project Draft EIS/EIR for comment. At public meetings and at the request of interested community members, Massport has provided the public full access to information about the Airside Project and its associated social and environmental effects.
41.4	Alternatives	Runway 14/32	...Cambridge City Council... [opposes] this runway because of the negative effects it will have on the health and quality of life of our citizens....	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern. The emissions inventory and dispersion modeling indicate better air quality conditions with Runway 14/32 and the Centerfield Taxiway than with the No Action Alternative.

LETTER 42

April 20, 1999

Mr. Robert Durand, Secretary
Executive Office of Environmental Affairs
Attention: MEPA Office
Arthur Pugsley, EOEA No. 10458
100 Cambridge Street - 20th Floor
Boston, MA 02202

Mr. John Silva
Federal Aviation Administration
New England Region Headquarters
12 New England Executive Park
Burlington, MA 01803

Dear Sirs:

Each year, I receive numerous complaints from residents about noise from commercial airplane flights over Cambridge. Therefore, I must object to any expansion or operational changes at Logan Airport that would result in more planes flying over our city.

Runway 33L is the one that most affects Cambridge. I understand that this runway must be used during periods when strong winds are blowing from the northwest but I am concerned that construction of runway 14-32 would greatly increase the number of flights using runway 33L. According to Massport, their current goal is for this runway to be used about 12 percent of the time but in actuality it is used only a little over 5 percent of the time. With the construction of runway 14-32, runway 33L is projected to be used between 26 and 43 percent of the time. This will severely increase the noise impacts on Cambridge residents. 42.1

Massport has stated that although the number of flights over Cambridge will increase, the number of nighttime flights will be reduced. Currently, Massport operates Logan with two basic runway configurations, one in a general north/south direction using three runways, and the other in a general east/west direction but with only two runways, including runway 33L. Because of the capacity constraints on the two runway configuration, the three runway configuration is used in peak demand periods unless there are heavy winds from the northwest.

In order to try and balance the total flights over all communities, Massport uses runway 33L more often at night and on weekends because there are fewer flights which can be accommodated by using only two runways. With the addition of runway 14-32, there

will be three runways for the east/west configuration resulting in an increase in capacity to that of the north-south three runway configuration. Therefore, some of the current night and weekend flights over Cambridge will move to the north-south configuration and some of the daytime flights will move to the east/west configuration. This is intended to better balance the impact among all communities. What guarantees are in place to make sure this will happen? While the proposed runway changes are designed to reduce impacts on the communities both north and south of Logan, they do not appear to be embraced by most communities, including East Boston, Hull and Winthrop. 42.2

Massport has abandoned the idea of charging higher landing fees during peak demand periods because of the financial impact on the regional carriers that use small planes and thus have fewer passengers to share in the cost. This position should be reconsidered since the result would be to move some flights to the off-peak periods and/or move some of the carriers to the other regional airports in Manchester, Providence and potentially Worcester. The result would be to reduce airplane noise in Cambridge and other communities currently impacted. 42.3

Massport has based the need for runway 14-32 on the desire to reduce the amount of airplane delay which they say is 120,000 hours per year (sixth highest in the country). Massport's Community Advisory Committee (CAC) and others have questioned that data. Massport itself has indicated that by the year 2010 delays will increase by 39,000 hours annually even with the new runway. 42.4

I am therefore requesting that Massport be instructed to resolve the issue of how much airplane delay is actually occurring at Logan before deciding on what improvements, if any, should be made. In addition, Massport should be instructed to reopen the issue of peak period pricing and any other operational changes the could reduce the need for new runways.

Thank you for the opportunity to comment on this project.

Very truly yours,

Robert W. Healy
City Manager

42.1	Alternatives	Runway 14/32	Runway 33L is the one that most affects Cambridge…I am concerned that construction of Runway 14/32 would greatly increase the number of flights using runway 33L…With the construction of Runway 14/32, runway 33L is projected to be used between 26 and 43 percent of the time. This will severely increase the noise impacts on Cambridge residents.	The Supplemental DEIS/FEIR indicates that the Preferred Alternative promote runway use in a manner that is more consistent with annual PRAS goals. The PRAS goals were established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations. Total departures from Runway 33L would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below, the annual goals for these operations.
42.2	Alternatives	Runway 14/32	With the addition of Runway 14/32, there will be three runways for the east/west configuration resulting in an increase in capacity to that of the north-south three-runway configuration. Therefore, some of the current night and weekend flights over Cambridge will move to the north-south configuration and some of the daytime flights will move to the east/west configuration…What guarantees are in place to make sure this will happen?	The FAA assigns the runways to be used for takeoff and landing using standard operating procedures that take into account wind, weather, traffic demands, PRAS recommendations and other factors. Modeling these conditions into the future requires knowledge of historical trends and predictions of future activity, and if those factors unfold as they have in the past, the projections are likely to occur as expected. However, the control of air traffic is a dynamic process and there are no guarantees or safeguards that the predictions will occur exactly as modeled.
42.3	Alternatives	Peak Period Pricing	Massport has abandoned the idea of charging higher landing fees during peak demand periods because of the financial impact on the regional carriers that use small planes and thus have fewer passengers to share in the cost. This position should be reconsidered since the result would be to move some flights to the off-peak periods and/or move some of the carriers to the other regional airports in Manchester, Providence and potentially Worcester. The result would be to reduce airplane noise in Cambridge and other communities currently impacted…Massport should be instructed to reopen the issue of peak period pricing and any other operational changes that could reduce the need for new runways.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport. Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.

Code	Topic 1	Topic 2	Comment	Response
42.4	Alternatives	Runway 14/32	Massport has based the need for Runway 14/32 on the desire to reduce the amount of airplane delay which they say is 120,000 hours per year (sixth highest in the country). Massport's Community Advisory Committee (CAC) and others have questioned that data. Massport itself has indicated that by the year 2010 delays will increase by 39,000 hours annually even with the new runway...I am therefore requesting that Massport be instructed to resolve the issue of how much airplane delay is actually occurring at Logan before deciding on what improvements, if any, should be made.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Section 1.4 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport.

LETTER 43

April 23, 1999

Robert Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street, 20th Floor
Boston, Massachusetts 02202

Dear Secretary Durand:

I would like to thank you for this opportunity to comment on the proposed Logan Airside Improvements Project, EOEA #10458. As the Chelsea City Manager, I am pleased to offer the following comments on behalf of Chelsea City Government and all of the residents of the City of Chelsea.

To help define the City's position on the addition of another runway at Logan, the City believes the focus belongs on the rights of airline passengers versus airport neighbors. In particular, we would respectfully ask those reviewing the runway expansion project if relieving the minutes of inconvenience caused to airline passengers at Logan should override the negative impacts such a tremendous increase in daily flight operations will have on the 30,000+ residents of Chelsea and others so impacted?

Having framed the question, some may answer yes. An argument may be made, I suppose, that the on-time shuttle of passengers and cargo to and from Logan Airport is so vital to the region's economic well-being that hundreds of thousands of people should suffer a deterioration in their quality of life for the benefit of the greater good. We in Chelsea are certainly very aware of that type of thinking. After all, Chelsea is host to a significant portion of the region's petroleum supply, as well as the region's largest salt pile and most important bridge. Additionally, thousands of trucks and millions of gallons of sewage a day can be found on and under our street network. The cumulative impact in the name of the greater good has already caused the most densely populated community in the commonwealth to suffer dramatically.

Yet, through it all, Chelsea has finally gained its stride after decades of missteps and at last appears to be on the verge of the revitalization for which generations have longed. We have learned to live with the problems being the regional solution to so many issues have posed, and through it all, we are achieving much despite the reduction in quality of life we suffer because of the burdens we bear. However, our capacity to absorb additional impacts and maintain an acceptable quality environment for our residents to enjoy and our businesses to thrive is central to the Logan expansion debate. We fear the

43.1

impacts, both real and perceived, from what is to be an incredible increase in airport operations and related support activities under the Logan AIP.

Of course, we realize if Logan Airport was the average size airport in the country by landmass, all of Chelsea would be on-airport. Yet, those pushing an expansion agenda need to realize that those sprawling airports are not often located in such densely populated neighborhoods as those surrounding Logan. By some estimates, Logan's capacity to generate additional passenger and cargo activity appears to be almost unlimited. At some point, however, the reversal in the quality of life caused by the absorption of that capacity begins to outweigh the supposed greater good achieving those numbers can produce.

From the passenger perspective, that which I am most familiar, the traveling public is so use to delays and inconveniences that many of us now build in extra time and bring along extra patience to deal with the problem. Certainly delay-free travel is a goal worthy of pursuit, however we cannot let the pursuit of the goal override a more fundamental goal we must all strive to realize: The peaceful and healthy enjoyment of one's neighborhood and home. It is this last point that brings us back to Chelsea.

Unfortunately, environmental justice is a concept we are just becoming familiar with in Chelsea. The odors have seemingly always been there. Now, however, we are learning about the high levels of VOCs in the emissions of the petroleum operations, the cyanide in the salt that blows off the piles and into our neighborhoods, and the particulates that thousands of dieseling trucks and more than 100,000 cars a day traveling over the three Chelsea bridges into Boston are adding to our environment. With several of our industrial operations on the list of top dischargers of solvents, and being downwind of the Exxon Terminal in Everett and Sithe Energies in Charlestown, Chelsea's statistically significant levels of respiratory cancers and other ailments may indeed be a result of the pollution corridor in which we are located.

It is by no coincidence that Chelsea has systematically enticed the middle and upper-middle class back to our community. I take very serious, though, the threats of many in those socio-economic categories that the addition of the runway means the end of their investment in Chelsea. Of course, those people have the means to make such a decision, no matter how devastating another flight of the middle class would be on our schools, civic institutions, political leadership, neighborhood stability and so much more. It is those of lesser means, though, the first and second generation immigrants and longer residents who have not found themselves a position on the corporate ladder of success that will again be left behind. Those who cannot afford to escape the environment

re: Logan Airside Improvements Project, EOEA #10458

around them will once again bear the same types of impacts brought to the city by the petroleum industry in the 1930's, the Tobin Bridge in the 1950's and the salt pile in the 1970's.

Chelsea has done its part and continues to work with the Massachusetts Port Authority to improve efficiencies at Logan Airport. We have become home to many of the freight forwarders who once populated Logan Airport, and we have developed a district that allows other support services to locate off-airport. We certainly understand the need for the region's largest economic engine to continue to spin-off the jobs and services that make Greater Boston one of the most attractive areas to live and work. However, like any good thing taken to the extreme, we remain concerned that the expansion of Logan Airport, without serious consideration and resolution of the tremendous impacts such an expansion will have on the residents of Chelsea and our fellow neighbors so situated, is unwarranted. To date, we have not seen a comprehensive plan that provides us with the necessary comfort level to believe that the noise, traffic and health impacts of the Logan expansion will be mitigated in our community. Of course, our suspicions are reflective of the lack of action that has taken place to solve the impacts we already have in our community. The city has not seen any soundproofing activity in more than a decade, the trucks keeping rolling through our community at greater levels and our insistence that our residents may suffer short- and long-term health problems as a result of so many noxious activities receives little attention. 43.2

Perhaps Logan has already reached its capacity to serve the region. The regional significance of more passengers and more cargo requires regional solutions, but in this case, it appears that Logan expansion proponents are suggesting that Logan is the only answer. The City believes otherwise. The regional discussion needs to not only include airports and highspeed rail, but must also question where, in a world that continues to grow smaller, does Logan's role as a cargo facility go into the future. Before committing to a new runway at the expense of the neighborhoods that have long existed before Logan appeared, we should have a more in-depth long-range plan to manage growth. While the cost of the alternatives and the impact of limiting growth may be substantial, so too is the impact on those who will bear the brunt of the negatives that the new runway could bring. In light of seeking a relevant framework for discussion, we must also question the validity of the dated data presently being used to determine both the so-called delays and the relief being offered by the Logan AIP. 43.3 43.4

Most importantly, we certainly feel Logan has exceeded its ability to call upon its neighbors to sacrifice any more. Never again should a television need to be turned up, an outdoor conversation need to be interrupted or a car alarm set off because

re: Logan Airside Improvements Project, EOEA #10458

a plane is flying overhead or an air freight truck is rumbling by. Gone forever should be the harmful fumes that find their way down from the skies and into our bodies. Perhaps policy officials should consider mitigating the existing impacts before creating even more like those the Logan AIP will undoubtedly create. 43.5

Again, on behalf of the City of Chelsea and all its residents, we greatly appreciate your review of the factors I have raised and others being raised by concerned citizens, business officials and elected and appointed leaders alike. Chelsea is eager to see the discussion on alternatives begin, and therefore hopes your review will cause our questions and others to be thoroughly investigated and acted upon.

Very truly yours,

Guy A. Santagate
City Manager

Code	Topic 1	Topic 2	Comment	Response
43.1	Alternatives	Runway 14/32	We fear the impacts, both real and perceived, from what is to be an incredible increase in airport operations and related support activities under the Logan AIP.	Refer to response to Comment 85.4. The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in future passenger and aircraft activity at Logan Airport. The environmental impacts associated with these alternative forecasts have been evaluated in the Airside analysis and GEIRs.
43.2	Alternatives	Runway 14/32	...we remain concerned that the expansion of Logan Airport, without serious consideration and resolution of the tremendous impacts such an expansion will have on the residents of Chelsea and our fellow neighbors so situated, is unwarranted. To date, we have not seen a comprehensive plan that provides us with the necessary comfort level to believe that the noise, traffic and health impacts of the Logan expansion will be mitigated in our community.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR. The Preferred Alternative is not expected to lead to an increase in passenger demand, and therefore, it will have no effect on congestion or delays on Boston area highways. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.

Code	Topic 1	Topic 2	Comment	Response
43.3	Regional Transportation	Cargo	...The regional significance of more passengers and more cargo requires regional solutions...The regional discussion needs to not only include airports and high-speed rail, but must also question where, in a world that continues to grow smaller, does Logan's role as a cargo facility go into the future. Before committing to a new runway at the expense of the neighborhoods that have long existed before Logan appeared, we should have a more in-depth long-range plan to manage growth.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act..." Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Secretary of Environmental Affairs' Certificate on the ENF directed Massport to "discuss [these] off-airport alternatives and analyze the potential each has to divert passengers and/or cargo from ... Logan Airport." Cargo operations were not specifically analyzed because they account for only two percent of aircraft activity at Logan Airport and since most all cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport.
43.4	Delay	Model	...[W]e...also question the validity of the dated data presently being used to determine both the so-called delays and the relief being offered by the Logan AIP.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.
43.5	Mitigation	Initiatives	...policy officials should consider mitigating the existing impacts before creating even more like those the Logan AIP will undoubtedly create.	Refer to the *Logan Airport 1999 ESPR* (previously GEIR) for the status of Massport's mitigation programs and to Chapter 8 of the Supplemental DEIS/FEIR for a discussion of proposed Airside Project mitigation measures.

April 8, 1999

LETTER 44

To Whom It May Concern:

The majority and the focus of my presentation today will address the inconstancies and inadequacies of the proposal before us as they relate to the City of Chelsea. I will, before the April 23rd deadline, submit a more comprehensive written comment.

First, I'd like to address the issue of the noise impact assessment. In order to go forward, it is necessary to look back. I first started examining the noise contour shortly after I bought my home in the Historic Waterfront District in 1996. After becoming elected to represent District 8, one of the communities that will be most heavily impacted if this proposal is authorized, I had the opportunity to attend a public hearing with the FAA and Massport Noise Abatement and Aviation Planning Officials. It was at this meeting in 1998 and through several communications between myself, Senator Kerry's Office and the FAA, that I learned why Chelsea is considered just outside the 65 dNL noise contour. It's because Massport submitted a map to the FAA based on a prediction made by a computer model that has consistently underestimated the noise level in our community. The proof is in the GEIR, and I will submit copies of my communications with the FAA along with this statement. Fact is that actual, that is measured noise results in Chelsea have been year after year above 65 and the predicted number used by Massport to assess the noise impact on the community is below 65. How convenient. 44.1

Without an accurate noise assessment the true impact of health, environment and real estate value effects can not be clearly defined, making any mitigation offer unreasonable. Based on the fact that Massport is using the same process to measure noise impacts that they have in black and white and in public admitted is not accurate, and based on the fact that the FAA recognizes the predicted noise levels are less than actual noise levels, the draft EIR should be rejected.

Further, it should be noted that the noise monitor location (figure 5.2-1) on page 5-13 indicates there is a permanent noise monitor on Admiral's Hill 44.2

in Chelsea, while all subsequent analysis of measured noise data is placed at "Shurtleff & Essex, Chelsea" a site that has not had a monitor since 1991, and then for only one year.

Another area of the EIR that is inadequate with respect to accuracy and thoroughness is the 4 page evaluation in section 8.7 of the environmental justice issue. Chelsea will receive the brunt of the short term negative impacts of this proposal should you see fit to give your approval. In a presentation to the Chelsea City Council on March 3, 1999 Massport representatives said runway 33 departures will increase from 4.8% to 12% of total departures (a 150% increase) and runway 15 arrivals will increase from 1.5% to 7.7% (a 413% increase). The associated increase in noise is large enough that, even using the understated predicted noise measures, 1100 homes will be eligible for soundproofing. While we feel sound insulation can not fully mitigate the impacts of increased ambient noise levels and many of the older homes will not be eligible for funding due to FAA Order 5100.38A which requires the property owner to bring homes up to code, we realize that Chelsea is the only community impacted devastatingly enough to qualify. The EIR concludes, "Given the reduction in the highest noise exposed population and this mitigation (soundproofing), the low income and minority population will not experience disproportionately high adverse impacts" in comparison to the affected population as a whole. This analysis is neither thorough, nor accurate, as the EPA Census maps on population density, minority concentration and people below poverty level show. The EIR's conclusion conflicts with President Clinton's Environmental Justice Executive Order 12898, which was designed to prevent the types of environmental and health injustices that have occurred in Chelsea for over a hundred years. To demonstrate this I have also attached a copy of an EPA funded report on the extent of industrial pollution in Chelsea and its relation to the socioeconomic status of Chelsea Residents. Essentially, the 4 page environmental justice analysis contained within the EIR does not adequately analyze the environmental effects, including human health, economic and social effects, of the proposed expansion. I would suggest the analysis is a yet another clever obfuscation of the truth. and That The Analysis in The Eir Doesn't meet The standards of The DOT Order.

44.3

44.4

I really consider the two previous points my strengths, but I would like to briefly add that the EIR is either inaccurate or incomplete with respect to the following:

* Alternatives under discussion such as a comprehensive peak hour pricing analysis using a range of operations per hour levels instead of the single higher operational threshold that underestimated the delay reduction. Hanscom should not be ruled out as a piece of the regionalization solution, and a second major airport should have at least been considered. 44.5 44.6
* Air quality measurement. Noise and air quality equipment should be along flight paths, Chelsea's air monitor is at the Soldier's Home – out of harm's way. 44.7
* The impact on the Upland Sandpiper. The plan to relocate and or mitigate for this endangered species is inadequate and indefinite. 44.8
* Traffic Study. A study of the long-term traffic impacts on the surrounding communities should be as comprehensive as possible. 44.9
* A benefit cost analysis – how can you realistically and honestly mitigate the noise, health and real estate costs to residents? 44.10
* The commitment to maintain the new runway's unidirectional status – there isn't one. 44.11
* Data used for this analysis is over 5 years old and doesn't reflect current conditions. 44.12

For all of these reasons, and I'm sure many more, I encourage you to find the proposal before us today functionally inadequate and I would respectfully request that a new draft document should be required before any expansion can be considered. I would also suggest that any future requests for expansion include an independent impact assessment that would meaningfully, thoroughly and accurately detail the impacts on surrounding communities like Chelsea.

Sincerely,

Preston G. Galarneau, Jr

Preston G. Galarneau, Jr

(617) 889-8349 Fax

Wednesday, July 01, 1998

The Honorable John F. Kerry
United States Senator
One Bowdoin Square
Tenth Floor
Boston, MA 02114

Dear Senator Kerry:

As a newly elected Councilman representing District 8 Chelsea residents, the single most common complaint I receive is about aircraft noise. Just a month or so after purchasing my home in the Historic Waterfront District I wrote to you to see if there was any possibility of relief. I was impressed with the timeliness of Constituent Services' response, and frankly I was satisfied with the explanation offered by Massport and the FAA: "Residential areas in Chelsea are outside of the 65 DNL contour and thus not eligible for federal funding." I have not written since.

Recently, however, in my capacity as Councilman I have taken the time to learn everything I could about this issue. The facts are disturbing. The truth of the matter is that Massport's "state-of-the-art Noise Monitoring System" on Admiral's Hill in Chelsea has measured Day Night Average Sound Levels (DNL's) ***above*** 65 in every year back through 1994! At last night's Subcommittee Meeting regarding air pollution resulting from Logan Airport I asked "Why, if the measured levels are above the 65 DNL level year after year, does Chelsea not qualify for assistance?" The answer is preposterous. Following FAA, Department of Transportation guidelines, Massport has provided the FAA with a noise exposure map based on "forecast aircraft operations at the airport for the fifth calendar year beginning after the date of submission." In other words, using data provided by Logan Airport, a computer model known as the INM (Integrated Noise Model) has predicted that Chelsea will fall below the 65 DNL level in 1999. Because of this our health is being ignored?

The system used to make this optimistic prediction (which has consistently been proven false by real world experience) is regarded by the FAA as "The Descriptor of Choice for Airport Noise Assessment." It is not hard to figure out why. The descriptor of choice has saved the FAA and Massport untold millions of dollars by being wrong again and again. That Massport has more than once chosen not to revise the model to more accurately reflect reality is indefensible. When you, or any other representative of the residents of District 8 explain why Chelsea is not eligible for Federal funding, I think it is important to explain the truth as Massport finally has. Then the question becomes do you accept it?

At the meeting last night I asked members of the Massport Noise Abatement team what will happen when 1999 is over and the hard data again proves the model wrong? The answer is a new model will be developed some time after the year 2000. I'm sorry, but I have little confidence in their ability to produce a model that will accurately reflect the noise of jet plane after plane roaring over the head of my 18 month old son as he plays in Paloma Park on a Sunday morning.

I respectfully request that you fully investigate this matter on behalf of your constituents in Chelsea.

Sincerely,

Preston G. Galarneau, Jr
District 8 City Councilor

ration of aircraft, in the air or on the ground.

"Sound exposure level" means the level, in decibels, of the time integral of squared A-weighted sound pressure during a specified period or event, with reference to the square of the standard reference sound pressure of 20 micropascals and a duration of one second.

"Yearly day-night average sound level" (YDNL) means the 365-day average, in decibels, day-night average sound level. The symbol for YDNL is also L_{dn}.

[Doc. No. 18691, 49 FR 49269, Dec. 18, 1984, as amended by Amdt. 150-1, 53 FR 8724, Mar. 16, 1988; 53 FR 9726, Mar. 24, 1988; Amdt. 150-2, 54 FR 39296, Sept. 25, 1989]

§ 150.9 Designation of noise systems.

For purposes of this part, the following designations apply:

(a) The noise at an airport and surrounding areas covered by a noise exposure map must be measured in A-weighted sound pressure level (L_A) in units of decibels (dBA) in accordance with the specifications and methods prescribed under Appendix A of this part.

(b) The exposure of individuals to noise resulting from the operation of an airport must be established in terms of yearly day-night average sound level (YDNL) calculated in accordance with the specifications and methods prescribed under Appendix A of this part.

(c) Uses of computer models to create noise contours must be in accordance with the criteria prescribed under Appendix A of this part.

§ 150.11 Identification of land uses.

For the purposes of this part, uses of land which are normally compatible or noncompatible with various noise exposure levels to individuals around airports must be identified in accordance with the criteria prescribed under Appendix A of this part. Determination of land use must be based on professional planning criteria and procedures utilizing comprehensive, or master, land use planning, zoning, and building and site designing, as appropriate. If more than one current or future land use is permissible, determination of compatibility must be based on that use most adversely affected by noise.

§ 150.13 Incorporations by reference.

(a) *General.* This part prescribes certain standards and procedures which are not set forth in full text in the rule. Those standards and procedures are hereby incorporated by reference and were approved for incorporation by reference by the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR Part 51.

(b) *Changes to incorporated matter.* Incorporated matter which is subject to subsequent change is incorporated by reference according to the specific reference and to the identification statement. Adoption of any subsequent change in incorporated matter that affects compliance with standards and procedures of this part will be made under 14 CFR Part 11 and 1 CFR Part 51.

(c) *Identification statement.* The complete title or description which identifies each published matter incorporated by reference in this part is as follows:

International Electrotechnical Commission (IEC) Publication No. 179, entitled "Precision Sound Level Meters," dated 1973.

(d) *Availability for purchase.* Published material incorporated by reference in this part may be purchased at the price established by the publisher or distributor at the following mailing addresses.

IEC publications:

(1) The Bureau Central de la Commission Electrotechnique, Internationale, 1, rue de Varembe, Geneva, Switzerland.

(2) American National Standards Institute, 1430 Broadway, New York, NY 10018.

(e) *Availability for inspection.* A copy of each publication incorporated by reference in this part is available for public inspection at the following locations:

(1) FAA Office of the Chief Counsel, Rules Docket, AGC-10, Federal Aviation Administration Headquarters Building, 800 Independence Avenue, SW., Washington, D.C. 20591.

AUTHORITY: 49 U.S.C. 1346, 1354(a), 1421, 1431, 2101, 2102, 2103(a) 2104 (a) and (b), 2201 *et seq.*; 49 U.S.C. 100(g) (Revised, Pub. L. 97-449, Jan. 12, 1983).

SOURCE: Docket No. 18091, 49 FR 49269, Dec. 18, 1984, unless otherwise noted.

Subpart A—General Provisions

§ 150.1 Scope and purpose.

This part prescribes the procedures, standards, and methodology governing the development, submission, and review of airport noise exposure maps and airport noise compatibility programs, including the process for evaluating and approving or disapproving those programs. It prescribes single systems for— (a) measuring noise at airports and surrounding areas that generally provides a highly reliable relationship between projected noise exposure and surveyed reaction of people to noise; and (b) determining exposure of individuals to noise that results from the operations of an airport. This part also identifies those land uses which are normally compatible with various levels of exposure to noise by individuals. It provides technical assistance to airport operators, in conjunction with other local, State, and Federal authorities, to prepare and execute appropriate noise compatibility planning and implementation programs.

§ 150.3 Applicability.

This part applies to the airport noise compatibility planning activities of the operators of "public use airports," including heliports, as that term is used in section 101(1) of the ASNA Act as amended (49 U.S.C. 2101) and as defined in section 503(17) of the Airport and Airway Improvement Act of 1982 (49 U.S.C. 2202).

[Doc. No. 18091, 49 FR 49269, Dec. 18, 1984, as amended by Amdt. 150-1, 53 FR 8723, Mar. 16, 1988]

§ 150.5 Limitations of this part.

(a) Pursuant to the ASNA Act (49 U.S.C. 2101 et seq.), this part provides for airport noise compatibility planning and land use programs necessary to the purposes of those provisions. No submittal of a map, or approval or disapproval, in whole or part, of any map or program submitted under this part is a determination concerning the acceptability or unacceptability of that land use under Federal, State, or local law.

(b) Approval of a noise compatibility program under this part is neither a commitment by the FAA to financially assist in the implementation of the program, nor a determination that all measures covered by the program are eligible for grant-in-aid funding from the FAA.

(c) Approval of a noise compatibility program under this part does not by itself constitute an FAA implementing action. A request for Federal action or approval to implement specific noise compatibility measures may be required, and an FAA decision on the request may require an environmental

tal Policy Act (42 U.S.C. 4321 *et seq.*) and applicable regulations, directives, and guidelines.

(d) Acceptance of a noise exposure map does not constitute an FAA determination that any specific parcel of land lies within a particular noise contour. Responsibility for interpretation of the effects of noise contours upon subjacent land uses, including the relationship between noise contours and specific properties, rests with the sponsor or with other state or local government.

§ 150.7 Definitions.

As used in this part, unless the context requires otherwise, the following terms have the following meanings.

"Airport" means any public use airport, including heliports, as defined by the ASNA Act, including: (a) Any airport which is used or to be used for public purposes, under the control of a public agency, the landing area of which is publicly owned; (b) any privately owned reliever airport; and (c) any privately owned airport which is determined by the Secretary to enplane annually 2,500 or more passengers and receive scheduled passenger service of aircraft, which is used or to be used for public purposes.

"Airport noise compatibility program" and "program" mean that program, and all revisions thereto, reflected in documents (and revised documents) developed in accordance with Appendix B of this part, including the measures proposed or taken by the airport operator to reduce existing noncompatible land uses and to prevent the introduction of additional noncompatible land uses within the area.

"Airport Operator" means the operator of an airport as defined in the ASNA Act.

"ASNA Act" means the Aviation Safety and Noise Abatement Act of 1979, as amended (49 U.S.C. 2101 et seq.).

"Average sound level" means the level, in decibels, of the mean-square, A-weighted sound pressure during a specified period, with reference to the square of the standard reference sound pressure of 20 micropascals.

this part as nonc patible with the outdoor nois ment (or an adequately attenuated noise level reduction for any indoor activities involved) at the location because the yearly day-night average sound level is at or below that identified for that or similar use under Appendix A (Table 1) of this part.

"Day-night average sound level" (DNL) means the 24-hour average sound level, in decibels, for the period from midnight to midnight, obtained after the addition of ten decibels to sound levels for the periods between midnight and 7 a.m., and between 10 p.m., and midnight, local time." The symbol for DNL is L_{dn}.

"Noise exposure map" means a scaled, geographic depiction of an airport, its noise contours, and surrounding area developed in accordance with section A150.101 of Appendix A of this part, including the accompanying documentation setting forth the required descriptions of forecast aircraft operations at that airport during the fifth calendar year beginning after submission of the map, together with the ways, if any, those operations will affect the map (including noise contours and the forecast land uses).

"Noise level reduction" (NLR) means the amount of noise level reduction in decibels achieved through incorporation of noise attenuation (between outdoor and indoor levels) in the design and construction of a structure.

"Noncompatible land use" means the use of land that is identified under this part as normally not compatible with the outdoor noise environment (or an adequately attenuated noise reduction level for the indoor activities involved at the location) because the yearly day-night average sound level is above that identified for that or similar use under Appendix A (Table 1) of this part.

"Regional Airports Division Manager" means the Airports Division Manager having responsibility for the geographic area in which the airport in question is located.

"Restriction affecting flight procedures" means any requirement, limitation, or other action affecting the op-

TOTAL P.09

Table 6-5 presents a comparison of the measured L_{dn} values at each installed monitoring location to the corresponding value calculated by the adjusted INM 5.0 for 1996. As expected, the best agreement is seen at the sites close to the airport, where aircraft noise is greatest. At the more remote locations, the measured noise level tends to be significantly higher than the INM-predicted value, since community sounds from traffic on local roads and other human activity contribute more to the overall noise level. Also, aircraft flight paths far from the airport are usually more dispersed over the ground, and hence are more difficult to model. For example, at sites 4 and 5 in Winthrop, where the dominant source of noise is aircraft overflights from arrivals on Runway 27 and departures on Runway 9, the INM-predicted noise level is within one decibel of the measured noise levels. Any community noises at these sites contribute far less to the overall sound levels than the aircraft noise.

Table 6-5
Comparison of Measured L_{dn} Values to INM-Computed L_{dn} Values for 1996

JUL 16 1998

The Honorable John F. Kerry
United States Senator
One Bowdoin Square
Tenth Floor
Boston, Massachusetts 02114

Dear Senator Kerry:

We are responding to your letter of July 2, 1998, concerning aircraft noise issues contained in a July 1, 1998, letter to you from Chelsea City Councilor Preston G. Galarneau.

Mr. Galarneau questions the accuracy of the Integrated Noise Model (INM) in predicting the noise environment from Logan International Airport in Chelsea, citing measured noise levels that exceed INM-predicted noise levels. He also criticizes use of forecasted 1999 noise contours in establishing eligibility for Massachusetts Port Authority's (Massport) soundproofing program.

We would expect community noise measurements to exceed INM-predicted noise levels since measured noise reflects ambient noise levels. As is stated in the text from the page of the study that Mr. Galarneau provided, "At the more remote locations, the measured noise level tends to be significantly higher than the INM-predicted value, since community sounds from traffic on local roads and other human activity contribute more [than at close-in locations] to the overall noise level." This factor and the capability of the model to predict noise levels at lower levels such as 65 DNL explain at least some of this difference.

Since 1994, the Federal Aviation Administration has required that Massport utilize a forecasted 1999 noise contour as the basis of soundproofing eligibility. This noise contour reflects the noise environment from close to 100% compliance with the requirement to phase out older, noisier airline aircraft. We require its use because we are concerned that scarce resources for soundproofing not go toward soundproofing residences that would no longer need it until sometime after the year 2000 when growth in aircraft operations would cause noise contours to expand again.

Massport may submit a new official noise exposure map for post-1999 at any time. Alternatively, they will need a new one after 1999. We note that progress on residential soundproofing of currently eligible homes indicates that Massport's program will be ongoing for several more years. As the soundproofing program continues, it needs to be recognized that the list of eligible homes will probably exceed the available Airport Improvement Program (AIP) funds that can be provided on an annual basis.

Should Chelsea become eligible as part of any new noise exposure map, they too must be part of the on-going list of eligible homeowners. On a positive note, it is the largest soundproofing program in the New England Region and we have been successful in providing AIP funds on an annual basis. Hopefully that will continue with reauthorization of the AIP.

Sincerely,

for Robert S. Bartanowicz
Regional Administrator

AUG 2 8 1998

The Honorable John F. Kerry
United States Senator
One Bowdoin Square
Tenth Floor
Boston, Massachusetts 02114

Dear Senator Kerry:

We are responding to your letter of August 10, 1998, which was written as a follow-up to our letter of July 16, 1998, to Chelsea City Councilor Preston G. Galarneau. Your letter addresses two points stated in our letter.

Can you believe this?

The first point refers to the use of the term "remote locations" in describing a noise monitoring location in Chelsea, noting that Chelsea is not a remote location. Please understand that this term was quoted from an environmental study not written by the Federal Aviation Administration. Thus, we cannot state with certainty what the author intended. From the context in which it is used, however, our interpretation is that it appears to be used as a relative term to connote that the Admirals Hill noise monitoring site is remote when compared to the other noise monitoring sites detailed in the report. We don't think that it was meant to connote that Chelsea is remote from Logan International Airport.

The second point refers to encouraging Massachusetts Port Authority (Massport) to update its noise exposure map sooner rather than later in order to account for actual rather than predicted conditions. While we will suggest this to Massport, it may have little effect on soundproofing in Chelsea, assuming that areas of Chelsea are found eligible. The reason for this is that Massport is currently soundproofing homes in East Boston that are exposed to greater noise levels and, given the level of funding that we have been able to apply, anticipates doing so for several more years.

We have been strong advocates for soundproofing funds for the three airports in New England that are part of our program (Boston, Providence, and Manchester). Over the years Massport has received substantially more for Logan than the other two airports combined. We will continue to push hard for these funds.

Sincerely,

(1) When configuration 33/27 is in use, hourly Leqs in Chelsea can reach the low 70's during high volume periods of the day.

(2) When Runway 33 is being used for departures, maximum event noise levels are often in the mid-90 dBA range, and can exceed 100 dBA.

(3) Not un-expectedly, noise levels from Runway 33 departures are generally slightly higher at the Galarneau residence than at the permanent monitor. This results from the lower altitudes of the aircraft overflying the Galarneau residence, which is closed to the airport than the permanent monitor.

Please advise if you want me to distribute any of the above, and to whom.

MEMORANDUM

TO: Betty Desrosiers
FROM: Emilio Favorito
DATE: 23 November 1998
RE: GALARNEAU SURVEY DATA/ RESULTS

Attached please find the data and analysis results from the noise monitoring survey which was conducted at City Councillor Preston Galarneau's residence at 15 Beacon Street in Chelsea, as requested. The survey spans the 16-day time period from October 26th to November 10th.

The following items are attached:

-A- "INTERVAL REPORT - Galarneau" (16 pages) provides the hourly Leq, Lmin, Lmax, L5, L50 and L90 for each of the hours that the portable monitor was recording data over the 16-day period.

-B- "HOURLY NOISE STATISTICS - RMS 15" (10 pages) provides equivalent data ffom the permanent Chelsea noise monitor.

-C- "RUNWAY CONFIGURATION" Report (3 pages) provides the runway configurations in use for the time period in question.

-D- "SUMMARY/COMPARISON (5 days)" (5 pages) essentially takes the "INTERVAL REPORT - Galarneau" and adds in the Leq and Lmax data from the permanent monitor (columns marked RMS 15), as well as the listed runway configuration (column marked "config").

The following items were also compiled, but are ***not*** included in the attachments. They are available if desired.

-E- "EXCEEDANCE REPORT- Galarneau" (28 pages) lists noise data for each of the individual noise events at that location that exceeded the monitor threshold.

-F- "RMS 15 EVENTS" (38 pages) provides similar information for the permanent Chelsea noise monitor.

From item "D" the following observations can be made:

(1) When configuration 33/27 is in use, hourly Leqs in Chelsea can reach the low 70's during high volume periods of the day.

(2) When Runway 33 is being used for departures, maximum event noise levels are often in the mid-90 dBA range, and can exceed 100 dBA.

(3) Not un-expectedly, noise levels from Runway 33 departures are generally slightly higher at the Galarneau residence than at the permanent monitor. This results from the lower altitudes of the aircraft overflying the Galarneau residence, which is closed to the airport than the permanent monitor.

Please advise if you want me to distribute any of the above, and to whom.

INDUSTRIAL POLLUTION IN CHELSEA

Summary

* From 1987 to 1994, as part of normal production, industrial companies in Chelsea reported that they released 666,188 pounds of toxic chemicals into the environment, or 83,274 pounds each year. Nearly all of this amount was released directly into the air. Over 95% of the air releases were made of three toxic chemicals: 1,1,1-trichloroethane, xylene, and toluene. These three chemicals can seriously damage human health. These companies are located mainly in the industrial area in the northeastern part of the city near Revere and the Chelsea River.
* Seven companies reported emergency releases of toxic chemicals (mainly fuel) during the 1987-1995 period. Some of these releases were very large. One was greater than 200,000 pounds of fuel. These companies are located mainly along Eastern Avenue and the waterfront area.
* Numerous other small, non-emergency releases of toxic chemicals took place, not only in industrial areas, but at several schools, too. High concentrations of lead and other toxins were turned up at the Williams and Shurtleff Schools.
* Chelsea is home to 44 toxic waste sites, also called "21E" sites, scattered throughout the western industrial area (near Everett) and the eastern waterfront industrial sections. Some of these sites contain hazardous waste, while most contain petroleum waste. These areas are known as "brownfields". Most of these sites are still far from being cleaned up.
* Chelsea's four biggest users of toxic chemicals used over 2.5 million pounds of reproductive toxins in 1993. These chemicals can damage the human reproductive system.
* Higher levels of pollution appear to be present in neighborhoods with a higher percentage of low income residents - particularly in low-income communities of color - while fewer sources of industrial contamination are found in higher income neighborhoods.

Scope of the Study

This study examines the extent of industrial pollution in Chelsea and its possible relation to socioeconomic status of Chelsea residents.

Lead poisoning is considered to be the main environmental health hazard in Chelsea, due to high incidence of older housing stock containing lead paint. In this study we do not quantify the extent of lead contamination and its health effects. We do recognize, however, the strong link between lead poisoning and a general lack of education about lead hazards and the lack of financial means among low income residents to have lead dangers removed.

Instead, we examine the extent of industrial toxic releases and their relation to socioeconomic status of Chelsea residents. Industrial and commercial pollution in Chelsea occurs in several ways:

1) As a frequent release into the environment from a factory or other business establishment. Businesses large enough are asked (voluntarily) to report what they emit into the environment each year to the U.S. Environmental Protection Agency. This information is compiled annually in the federal Toxic Release Inventory.

2) As an accidental release or spill. These are single events, not continuous or frequent releases over the period of one year, as is reported in the Toxic Release Inventory. Sometimes these releases are reported as an emergency, particularly if they are big. Other times, when they

are small and are not thought to pose a threat to the public, they are reported as non-emergency spills or releases.

3) As a "21E" waste site. 21E is a designation given by the Massachusetts Department of Environmental Protection to sites where significant amount of petroleum waste or hazardous waste have accumulated.

In addition, toxic chemicals used in production, and stored on-site at factories, are considered to be a potential health hazard, even if they are not actually released into the community.

Reported Toxic Releases from Industrial Production

According to the federal Toxic Release Inventory (TRI) Chelsea has experienced significant industrial toxic releases since reporting began in 1987. Tables 1 and 2 show toxic releases from the Toxic Release Inventory for each year from 1987 to 1994. Total reported environmental releases have risen from 53,555 lbs. in 1987, to a peak level of 167,539 lbs. in 1989, then declining somewhat through 1992, before dropping off significantly in 1993 and 1994. Nearly all of the pounds released were released to the air.

The three major pollutants - 1,1,1-trichloroethane, xylene, and toluene - are chemicals which, at high enough levels, can seriously damage human health, including causing cancer. See Table 3 for a brief description of the health effects from exposure to these chemicals.

The sources of this pollution are six industrial facilities. The largest emissions came from Emtex, Inc., and Glyptal, Inc., both located in the northeastern part of the city, near Chelsea Creek. At its peak, the largest polluter, Emtex (181 Spencer Ave.), released 140,844 pounds of 1,1,1-trichloroethane into the air in 1989 and 113,656 pounds into the air in 1992. Since 1992, however, there are no reported toxic releases from Emtex.

Glyptal (305 Eastern Ave.) released a peak level of 20,164 pounds of 8 chemicals into the air in 1989. Since then its releases have gradually dropped down to around 10,000 pounds in 1992-1994. The company's major pollutants are xylene and toluene.

Accidental Releases or Spills: Emergency and Non-Emergency

Seven companies reported emergency response releases or spills during the period of 1987-1995 (see Table 4). Most of these companies are located in the industrial areas along the Chelsea River. Nearly all of the releases or spills were gasoline or oil. Several releases were very large. Gulf Oil (281 Eastern Ave.) released 68,961 pounds of gasoline in 1992 and 13,200 pounds of kerosene in 1990. Amoco Oil (111 Eastern Ave.) released 203,000 pounds of fuel oil in 1993. B.A.T. Transportation (281 Eastern Ave.) released 15,250 pounds of gasoline in 1993. Coastal Oil (at Chelsea Dock) released 50,040 pounds of asphalt in 1994.

There were numerous smaller, non-emergency releases of toxic chemicals in the past several years alone, as documented by the Mass. Department of Environmental Protection. Table 6 locates these smaller releases by census tract. Some of these smaller releases include heavy metals - such as zinc, copper, and lead - and relatively small amounts of fuel oil or petroleum hydrocarbons. Several releases are notable. The Shurtleff School (76 Congress Ave.) experienced a release of petroleum hydrocarbons (860 parts per million) and lead (490 parts per million) in June, 1995. There was a release of lead at a very high concentration (13,000 parts per million) at the Williams School (170-180 Walnut St.) in September 1994.

"21E" Waste Sites

Chelsea is home to 44 "21E" waste sites, as identified by the Department of Environmental Protection (see **Table 5**). Most of these waste sites contain petroleum waste, while seven sites contain non-petroleum hazardous waste alone, and 12 sites contain both petroleum and hazardous wastes. These sites are in various stages of clean-up (or "remediation"). But it appears that most of the sites are not close to being cleaned up. The waste sites are located at a wide variety of facilities, from the Williams School to Amoco Petroleum to Forbes Lithographic to the Chelsea Housing Authority. They are found largely in the city's western industrial area and the northeastern industrial area along the Chelsea River.

Many of these sites are considered "brownfields". This means that they are on vacant land, contain abandoned or vacant buildings, and have a slight or moderate degree of contamination. Brownfields are typically not seriously contaminated waste sites, such as a "Superfund" (as designated by the U.S. Environmental Protection Agency). Rather they are lands that could be put to other uses after an effective cleanup takes place. What should happen to these brownfields in Chelsea after they are cleaned up is an important issue.

Toxic Chemicals Used in Industrial Production

In addition to toxic releases and waste sites, many companies use toxic chemicals in their day-to-day production activities. **Table 7** shows the four biggest industrial users of toxic chemicals in Chelsea. Each of these companies also uses toxic chemicals which have been proven to cause reproductive damage in humans. Biltrite Corp., Emtex, Glyptal, and Marson Corp., together used 2,511,424 pounds of reproductive toxins in their production activities in 1993, as documented by MASSPIRG and the Greater Boston Physicians for Social Responsibility (1996). Reporting of amount of toxic chemicals being used or stored or produced at a facility is not a strict legal requirement; reporting is only voluntary. This means that numerous other businesses in Chelsea, especially small businesses, are probably using or releasing toxic chemicals without reporting it.

Pollution and Socio-Economic Status

The most significant industrial pollution sources in Chelsea are found in the city's eastern sections, in close proximity to residential neighborhoods, and in the sparsely populated western industrial section. The northeastern section of the city (census tract 1605) has the highest percentage of communities of color living below the poverty line. According to the 1990 Census (see **Table 9**), 49% of African-Americans, 50% of Asians, and 50% of Hispanics lived below the poverty line in Census Tract 1605. This tract experienced the highest level of continuous toxic releases (from the Toxic Release Inventory) (see **Table 8**). Also located in this section of the city are three auto body shops and two dry cleaners, potential sources of highly toxic releases which typically go unreported. In addition, a greater incidence of petroleum fuel spills and leaks occurred in this section than elsewhere in the city.

The two census tracts with the highest percentage of Hispanic residents, tracts 1602 and 1604, also demonstrated a higher incidence of toxic releases than other parts of the city. Percentage of Hispanics living below the poverty line was 41% and 47% in these two tracts.

Recommendations

1) The Chelsea Fire Department should check the Toxics Use Reduction chemicals (used in industrial production) against their files in order to ensure emergency preparedness.

2) Exact status of 21E waste sites should be made known to Chelsea residents by the Department of Environmental Protection. It is not clear as to how close to completion of cleanup each of these sites is.

3) There needs to be far better public access to information on industrial toxic hazards. The Department of Environmental Protection's online database is not yet very user friendly. Getting access to environmental information at DEP is a very time-consuming process; the average citizen does not have this kind of time.

4) The companies releasing toxic chemicals into the environment need to be tracked further. For example, whatever happened to Emtex, Inc., which was once (up to 1992) the biggest releaser of toxic chemicals into the environment in Chelsea. Emtex is no longer reporting. Did the company move? Better tracking is critical. The City of Chelsea should help track these companies and provide that information to residents on a yearly basis.

5) There needs to be a closer examination of the proximity of current residential neighborhoods and schools to industrial environmental hazards.

Code	Topic 1	Topic 2	Comment	Response
44.1	Noise	Model	... measured noise results in Chelsea have been year after year above 65 and the predicted number used by Massport to assess the noise impact on the community is below 65...Without an accurate noise assessment the true impact of health, environment and real estate value effects can not be clearly defined....	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 6 of the *Logan Airport 1999 ESPR* (previously GEIR)). Massport continues to investigate possible causes for remaining differences (such as from hill effects) and continues to pursue FAA approval of noise model adjustments that would permit expansion of its sound insulation program to include the effects of terrain. Massport also expects to extend eligibility lines to include boundaries that follow local streets rather than strict noise contour lines. Nevertheless, Massport continues to believe that the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.
44.2	Noise	Model	...it should be noted that the noise monitor location (Figure 5.2-1) on Page 5-13 indicates there is a permanent noise monitor on Admiral's Hill in Chelsea, while all subsequent analysis of measured noise data is placed at "Shurtleff & Essex, Chelsea" a site that has not had a monitor since 1991, and then for only one year.	All the tables in the Airside Project Draft EIS/EIR that indicated that Monitor No. 15 is at Shurtleff & Essex have been changed in the Supplemental DEIS/FEIR to indicate that Monitor No. 15 is at Admiral's Hill.

Code	Topic 1	Topic 2	Comment	Response
44.3	Environmental Justice	Impacts	Another area of the EIR that is inadequate with respect to accuracy and thoroughness is the 4-page evaluation in Section 8.7 of the environmental justice issue. Chelsea will receive the brunt of the short term negative impacts of this proposal should you see fit to give your approval...The associated increase in noise is large enough that, even using the understated predicted noise measures, 1100 homes will be eligible for soundproofing.	The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation.
44.4	Environmental Justice	Impacts	The EIR concludes, "Given the reduction in the highest noise exposed population and this mitigation (soundproofing), the low income and minority population will not experience disproportionately high adverse impacts" in comparison to the affected population as a whole. This analysis is neither thorough, nor accurate, as the EPA Census maps on population density, minority concentration and people below poverty level [in Chelsea] show. The EIR's conclusion conflicts with President Clinton's Environmental Justice Executive Order 12898...	Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation.

Code	Topic 1	Topic 2	Comment	Response
44.5	Alternatives	Peak Period Pricing	Alternatives under discussion such as a comprehensive peak hour pricing analysis...[should use] a range of operations per hour...instead of the single higher operational threshold that underestimated the delay reduction.	The Airside Project analysis of PPP examined an operations threshold of 110 operations per hour, which is already below Logan Airport's normal operating capacity of 120 operations per hour. There is no legitimate operational justification for imposing a peak period surcharge at an operation level significantly lower than Logan Airport's normal operating capacity which is achieved 80 percent of the year without any delays. Even at 75 operations per hour, Logan Airport would be subject to delays from northwest wind conditions. The Airside Project analysis in the Draft EIS/EIR and in the Supplemental DEIS/FEIR indicates that, with the Preferred Alternative, Logan Airport can accommodate existing and foreseeable future levels of demand without imposing a drastic administrative restriction to artificially revise Logan Airport's existing capacity.
44.6	Regional Transportation	Regional Airports	Hanscom should not be ruled out as a piece of the regionalization solution, and a second major airport should have at least been considered.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the Hanscom GEIR (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to *Section 2.6 of* the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The statement referred to FAA reported (Opsnet) delays, which declined from 19,838 in 1993 to 16,403 in 1998. This decline in FAA delays was supported by the Airside Project modeling in the Supplemental DEIS/FEIR which showed a reduction in 1998 delays (120,000 hours) compared to 1993 (185,000 hours). Although total operations were nearly equivalent (519,000 in 1993 and 514,000 in 1998), the fleet mix and demand profile were significantly different. The high delays in 1993 were principally caused by a very peaked schedule with hourly operations exceeding 120 per hour.

Code	Topic 1	Topic 2	Comment	Response
44.7	Noise	Model	...Noise and air quality equipment should be along flight paths, Chelsea's air monitor is at the Soldiers Home — out of harm's way.	The DEP air quality monitoring stations, including the one located in Chelsea, are established to serve multiple functions. In some cases, the purpose is to record background concentrations, sometimes to evaluate neighborhood conditions, and in other situations to measure the impact of specific sources of air emissions. The Chelsea station is a neighborhood station and, therefore, the only relevant data to the airport area are the ozone data. By comparison, the DEP Bremen Street air monitoring station adjoins the airport and is in nearly the direct path of one of Logan Airport's runways. The data from both stations are reported in the EIS/R.
44.8	Ecosystems	Rare Species	The impact on the Upland Sandpiper. The plan to relocate or mitigate for this endangered species in inadequate and indefinite.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.
44.9	Ground Transportation	Access to Logan Airport	...A study of the long-term traffic impacts on the surrounding communities should be as comprehensive as possible.	The Airside Project does not result in additional aircraft operation or passenger demand for ground access services, since the project will not induce additional passenger demand. Refer to the *Logan Airport1994/95 GEIR* which includes Massport's Ground Access Management Plan and forecasted Vehicle Miles Traveled for the 37.5 million and 45 million passenger levels that were studied in the Airside Project analysis.
44.10	Alternatives	Impacts	A benefit cost analysis — how can you realistically and honestly mitigate the noise, health and real estate costs to residents.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. According to 40 CFR Part 1502 Environmental Impact Statements Regarding Cost-Benefit analysis " for purposes of complying with the act, the weighing of the merit and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis..."

Code	Topic 1	Topic 2	Comment	Response
44.11	Alternatives	Runway 14/32	The commitment to maintain the new runway's unidirectional status — there isn't one.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.
44.12	Analysis Assumptions	Base Year	Data used for this analysis is over 5 years old and doesn't reflect current conditions.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport.

Boston, MA 02202

Re: Logan Airside Improvements Planning Project, Boston, MA
EOEA #10458

Dear Secretary Durand:

As the City Councilor representing the residents of District 5 in Chelsea I thought I would write a comment about Massport's Airside Planning Project. Thank you for considering the opinion of the communities that will be impacted if the new runway is built.

The Draft EIR/S contains many discrepancies and inadequacies and fails to address our concerns regarding the health impacts of a new runway on our neighborhoods. For the reasons detailed below, and we are sure many more, we encourage you to find this document inadequate and respectfully request the FAA withdraw support for the project.

It has come to our attention that the new runway will allow for a tripling of flights over Chelsea. Enough is enough! Our health is currently jeopardized by hundreds of thousands of vehicles travelling over the Tobin Bridge on one side, airplanes arriving and departing over heads, a salt pile on another side, oil tank and asphalt facilities on our shores, and an onslaught of heavy truck traffic associated with all of them. We can not accept another assault on the quality of life in our neighborhood.

First and foremost, the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting Chelsea. The use of the same model to predict the impact of the dramatic increase in flights over our heads will surely underestimate it as well. We also feel that soundproofing would do little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park and does not help us as we try to enjoy a sea breeze through open windows in the summertime.

45.1

We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue. Chelsea is a City of immigrants – always has been and always will be. We believe it is not coincidence that we have been targeted with the brunt of the noise impact of the proposal. But what about the other impacts on the low income, minority residents of Chelsea? Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us. In this sense the document also seems woefully inadequate. 45.2

While Massport refuses to admit the Airside Improvement Planning Project will expand capacity at Logan, Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations. Nothing has been done to determine the traffic impacts associated with expected increases in operations associated with this proposal. Chelsea can expect nothing but a dramatic increase in airport related heavy truck activity. The effect of these trucks on health is well documented by the EPA, yet the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea. 45.3

Chelsea is undergoing a modern day renaissance. We have had to fight harder than most to turn the City around. As this proposal is being examined we are watching the value of our homes rise. We have a new school system and a local government committed to undoing the past. We were recently honored as an "All America City," in recognition for our ability to address the problems confronting us. Our budget is balanced for the first time, and we are investing millions in our infrastructure in order to move forward into the next century. The proposed expansion of Logan Airport is the single largest threat we face. If this runway is built, years of hard work could be undone in an instant.

Sincerely,

Marilyn Portnoy
Chelsea City Councilor – District 5

CC: Mr. John Silva, FAA
Mr. John DeVillars, EPA

Code	Topic 1	Topic 2	Comment	Response
45.1	Noise	Model	...the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting Chelsea. The use of the same model to predict the impact of the dramatic increase in flights over our heads will surely underestimate it as well. We also feel that soundproofing would do little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park and does not help us as we try to enjoy a sea breeze through open windows in the summertime.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Using results from a special study of Terrain Modeling analysis ("hill effects") in Orient Heights and Jeffries Point, Massport applied for and received approval to apply a correction to 1999 contours to account for increased levels in Orient Heights. Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
45.2	Environmental Justice	Impacts	We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue. Chelsea is a City of immigrants...We believe it is not coincidence that we have been targeted with the brunt of the noise impact of the proposal. But what about the other impacts on the low income, minority residents of Chelsea? Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us.	Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation. The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
45.3	Ground Transportation	Access to Logan	Nothing has been done to determine the traffic impacts associated with expected increases in operations associated with this proposal. Chelsea can expect nothing but a dramatic increase in airport related heavy truck activity. The effect of these trucks on health is well documented by the EPA, yet the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea.	The Airside Project does not result in additional aircraft operations because the Preferred Alternative would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. In addition, cargo operations account for only two percent of aircraft activity at Logan Airport since most all cargo aircraft operate during off-peak hours. Despite strong economic growth over the last few years cargo operations increased by less than two percent in 1999 and declined by 1.2 percent in 1998. Some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and our cargo activity at the regional airports.

Rochelle A. Bennett

City of Chelsea

LETTER 46

April 21, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley, IV, EOEA NO. 10458
100 Cambridge Street, 20th Floor
Boston, MA 02202

Re: EOEA File No. 10458

Dear Sir:

I am writing to express my concerns regarding proposed new Runway 1432 at Logan Airport. I want to preface my letter by saying that I am not opposed to progress, but at what price? Has Massachusetts sunk so low that progress is higher on the list than the health, safety and environmental injustice of its citizens? I would hope not.

Chelsea is approximately 1.8 square miles. Within the boundaries of this small community, you find oil farms, asphalt storage, salt piles, air freight businesses, a fur tanning business, the Boston produce center, the Tobin Bridge, the MWRA headworks and several park and fly facilities. The City is also a cross route to several major MBTA stops. Because of this, Chelsea experiences a very high level of truck (several thousands daily) and auto (approximately 100,000 daily) traffic which I believe has an extremely detrimental environmental impact on the community. In addition, Chelsea is surrounded by Logan Airport, Massport's salt pile in Charlestown and the Edison Plant in Everett. Add these together and you have one extremely high risk area. By allowing Logan Airport to expand, the EPA would be driving another environmental nail into our coffin. 46.1

When the Tobin Bridge was built, Chelsea lost 179 taxable properties and went downhill to the point of receivership. Chelsea is now on its way back up. The perception to the outside world is that Chelsea has been turned around and is a desirable place to work and live. Property values have rebounded. New businesses have opened. New schools have been built. While other communities surrounding Chelsea have flourished, it has taken Chelsea more than 50 years to get where it is today. If you allow Runway 1432 to be built, it could put Chelsea back into the rut it just climbed out of but this time Chelsea will never rebound. The new runway will not only cause people 46.2

7 Boatswain's Way, Chelsea, Massachusetts 02150

(617) 889-0671

to leave the City, it will lower property values and could hamper future non-airport businesses from moving here.

As a recent Cancer patient, I am asking that MEPA not approve Massport's EIR for Runway 1432 until a complete study can be compiled by all of the surrounding cities and towns to determine what adverse health hazards currently exist in each community. 46.3

I ask you to keep in mind that your job is to protect us from an unhealthy environment. Therefore, after reading the above and after reading Executive Order No. 385, I hope you will agree with me that more studies need to be done before any decision is made on Runway 1432; and if the above health issues are not enough to sway you, I ask that you find the draft EIS/EIR inadequate because it uses outdated studies, does not adhere to FAA modeling and shows a lack of alternative studies for a regional airport. I also feel that the residents of Chelsea were not given fair consideration in connection with this project. 46.4 46.5

Sincerely,

Rochelle A. Bennett

46.1	Ground Transportation	Access to Logan Airport	...Chelsea experiences a very high level of truck (several thousands daily) and auto (approximately 100,000 daily) traffic which I believe has an extremely detrimental environmental impact on the community...By allowing Logan Airport to expand, the EPA would be driving another environmental nail into our coffin.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates). The Airside Project does not result in additional aircraft operations because the Preferred Alternative would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. In addition, cargo operations account for only two percent of aircraft activity at Logan Airport since most all cargo aircraft operate during off-peak hours. Despite strong economic growth over the last few years cargo operations increased by less than two percent in 1999 and declined by 1.2 percent in 1998. Some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and our cargo activity at the regional airports.
46.2	Alternatives	Runway 14/32	The new runway will not only cause people to leave the City, it will lower property values and could hamper future non-airport businesses from moving here.	Comment noted.
46.3	Public Health	Effects	As a recent Cancer patient, I am asking that MEPA not approve Massport's EIR for Runway 14/32 until a complete study can be compiled by all of the surrounding cities and towns to determine what adverse health hazards currently exist in each community.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
46.4	Delay	Model	...the Draft EIS/EIR ...uses outdated studies, does not adhere to FAA modeling....	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The analysis contained in the Supplemental DEIS/FEIR has been updated to include modeled delay results for 1998 to provide more current context to airfield conditions at Logan Airport. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a description of the delay analysis and discussion of current and future delays at Logan Airport. This section of the Supplemental DEIS/FEIR also includes a description of computer models for estimating flight delays, including their limitations. FAA reviewed and approved the simulation models used in this study.
46.5	Regional Transportation	Regional Airports	...[the Draft EIS/EIR] shows a lack of alternative studies for a regional airport.	Chapter 2 of both the Airside Project Draft EIS/EIR and this Wupplemental DEIS/FEIR thoroughly address the role of the regional airports.

DAVID RAGUCCI
MAYOR

OFFICE OF THE MAYOR
EVERETT CITY HALL

EVERETT, MASSACHUSETTS 02149-3694

PHONE: (617) 394-2270
FAX: (617) 381-1150

LETTER 47

April 12, 1999

Jane F. Garvey, Administrator
Federal Aviation Administration
National Headquarters
800 Independence Avenue
Washington, D.C. 20591

Dear Ms. Garvey:

I am writing to express my opposition to the proposed expansion of Logan International Airport, particularly the planned construction of Runway 14/32. Several reasons are apparent why the Environmental Protection Agency ("EPA") should advise the Federal Aviation Administration against the proposed expansion. Noise pollution, as well as other unfavorable environmental consequences, are among the many reasons to oppose this plan.

As you are aware, Massachusetts Port Authority prepared an Alternative 1A Draft Environmental Impact Statement that details the agency's plan to expand and improve Logan. This alternative plan includes the construction of Runway 14/32, as well as the construction of a new taxiway entitled Centerfield Taxiway. I also ask that you join me in the opposition of the Alternative 1A proposal.

Communities surrounding Logan International Airport have long been affected by unpleasant environmental conditions such as noise pollution, air pollution and ground traffic. One of the many undesirable circumstances has been the increase in noise pollution to neighboring communities such as Revere, Winthrop and East Boston. It has been an ongoing battle of these residents to decrease the high levels of air traffic over their communities. In accepting the proposed Runway 14/32, flight traffic will be shifted over the Greater Boston Area to include communities such as Everett who will bear a greater amount of air traffic. 47.1 47.2

It is believed that the state and federal government are responsible to create a plan that would divert the excess traffic at Logan to other commercial airports that would welcome passenger service. 47.3

I am in agreement with Mayor Menino that a "Blue Ribbon Panel" should be established to create a regional aviation transportation agency to thoroughly examine the status of our aviation transportation system before we implement any new changes at Logan. 47.4

Communities surrounding Logan International Airport will have serious adversarial affects from the acceptance of the proposed Runway 14/32. Therefore, based on the above information, I can not support the implementation of a new runway or the expansion of Logan Airport.

I appreciate your time regarding this matter. I look forward to receiving the EPA's response to these concerns.

I am available to further discuss this matter at your convenience.

Sincerely,

Mayor David Ragucci

Letter 47

Everett, Massachusetts

Code	Topic 1	Topic 2	Comment	Response
47.1	Noise	Impacts	Communities surrounding Logan International Airport have long been affected by unpleasant environmental conditions such as noise pollution, air pollution and ground traffic. One of the many undesirable circumstances has been the increase in noise pollution to neighboring communities such as Revere, Winthrop and East Boston.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
47.2	Alternatives	Runway 14/32	In accepting the proposed Runway 14/32, flight traffic will be shifted over the Greater Boston Area to include communities such as Everett who will bear a greater amount of air traffic.	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels.
47.3	Regional Transportation	Regional Airports	It is believed that the state and federal government are responsible to create a plan that would divert the excess traffic at Logan to other commercial airports that would welcome passenger service.	Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.

Code	Topic 1	Topic 2	Comment	Response
47.4	Environmental Review Process	Blue Ribbon Panel	I am in agreement with Mayor Menino that a "Blue Ribbon Panel" should be established to create a regional aviation transportation agency to thoroughly examine the status of our aviation transportation system before we implement any new changes at Logan.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies have concluded that The Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high-speed rail are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of regional transportation alternatives to Logan Airport and steps Massport has taken to foster increased use of these alternatives. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999, attendance at a second summit in December 2000, and its assumption of operating responsibility for the Worcester Regional Airport in January 2000. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a discussion of Massport's initiatives in support regional transportation alternatives.

TOWN OF HINGHAM

OFFICE OF SELECTMEN

tharine W. Reardon, Chairman
Martin Crane, M.D.
Michael P. Holden

LETTER 48

Charles J. Cristello
Town Administrator

April 21, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley- EOEA
100 Cambridge Street, 20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

The Hingham Board of Selectmen wishes to submit the following comment on Massport's proposal to construct a new runway at Logan Airport and the SDEIR/SDEIS for the Logan Airside Improvements Planning Project as presented by the Massachusetts Port Authority.

We have reviewed the Citizens Advisory Committee's Consultant Report and it appears that there are several aspects in which the SDEIS/R is deficient. These include the use of out of date base line data, omission of key issues included in the ENF and an overly limited analysis of alternatives.

Hingham is projected to sustain a 152% increase in flights over the town. Many residents are concerned about the incremental effects on personal health and quality of life. In addition we are concerned about increased traffic congestion caused by increasing the capacity of the airport. 48.1 48.2

The Hingham Board of Selectmen is further concerned that this short term porposal, ostensibly to reduce current delays, will surely only delay by a short time the point at which airport traffic will once again become unmanageable. We urge Massport to withdraw this proposal and to enter into a long term planning effort to meet the needs of the New England region without overburdening the Boston metropolitan area with the impacts of air travel. 48.3

Finally, it is our view that, if not withdrawn, this SDEIS/R shold be rejected as inadequate.

Sincerely,

Michael P. Holden

Letter 48
Town of Hingham, Office of Selectmen
Michael P. Holden

Code	Topic 1	Topic 2	Comment	Response
48.1	Public Health	Effects	Hingham is projected to sustain a 152% increase in flights over the town. Many residents are concerned about the incremental effects on personal health and quality of life.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
48.2	Ground Transportation	Access to Logan	In addition we are concerned about the increased traffic congestion caused by increasing the capacity of the airport.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates). Federal constitutional provisions (preemption, commerce clause, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the Federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to limit the number of aircraft operations. Since Aviation Deregulation in 1979, airlines have been free to select their own markets, schedules and equipment without Federal, State or local intervention.

Code	Topic 1	Topic 2	Comment	Response
48.3	Alternatives	Runway 14/32	The Hingham Board of Selectmen is further concerned that this short term proposal...will surely only delay by a short time the point at which airport traffic will once again become unmanageable. We urge Massport to withdraw this proposal and to enter into a long term planning effort to meet the needs of the New England region without over-burdening the Boston metropolitan area with the impacts of air travel.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase. Over the last ten years, various agencies and transportation planning organizations have conducted a number of studies that address regional transportation issues. These studies have concluded that The Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high-speed rail are necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a complete discussion of regional transportation alternatives to Logan Airport and steps Massport has taken to foster increased use of these alternatives. Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. Massport's most recent endeavors include its co-sponsorship of the Regional Transportation Summit of New England Governors in November 1999, attendance at a second summit in December 2000, and its assumption of operating responsibility for the Worcester Regional Airport in January 2000. Refer to Section 2.9 of the Supplemental DEIS/FEIR for a discussion of Massport's initiatives in support regional transportation alternatives.

Town of Hull

BOARD OF SELECTMEN

MUNICIPAL BUILDING
HULL, MASSACHUSETTS 02045
(617) 925-2000

April 22, 1999

LETTER 49

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 022025

John C. Silva
Manager, Environmental Programs
Airport Division, ANE-600
New England Region
12 New England Executive Park
Burlington, MA 01803

Project Name:	**Logan Airside Improvements Planning Project**
Project Location:	**Boston-Logan International Airport-Boston / Winthrop**
Project Proponents:	**Massachusetts Port Authority, Federal Aviation Administration**
Project Number:	**EOEA No. 10458**

Dear Mr. Pugsley and Mr. Silva:

On behalf of the Town of Hull Board of Selectmen I am writing to voice the Town of Hull's opposition to the Draft Environmental Impact Report (EIR)/ Draft Environmental Impact Statement (EIS) filed by Massport and the Federal Aviation Administration. The Town of Hull objects to the construction of a new runway at Logan Airport for the following reasons.

- The base year for the documents calculations and projections is 1993. It is now 1999, using a base year that is six years old is inconsistent with sound planning principals as many of the underlying analysis and modeling require more current data to accurately project future outcomes. For instance, one of the project proponents, the FAA, shows that the percent of operations experiencing delay actually decreased from 1993 to 1998. The projections in the DELAYSIM model developed specifically for this project does not accurately reflect the current state of delay. The failure to use current data causes the model to severely overestimate delay. 49.1

  In addition the success of Providence, Manchester and now Pease airports are not reflected in 1993 data. The failure to fully capture the success of these alternatives calls into question the projections that are contained in the report. 49.2

- The document offers a lengthy discussion on delay but fails to fully articulate all the causes for delay. For instance it is impossible from reading the document to determine what percentage of delay is due to mechanical failure. Without a breakdown for the causes of delay the true scope of the Northwest wind caused delay cannot be fully defined. Even the statistics on weather delay do not stratify the delay data by type of weather. 1993 was one of the heaviest snow total winters on record. If there was a day that had a significant snowfall and strong winds how was delay attributed: to the wind direction or the snow fall? The document is silent on this issue. 49.3

The failure to fully define delay not only by type, length and cause but also to deviate from the FAA standard or the Department of Transportation (DOT) standard is cause to reject the report as the nature of the problem that Massport is seeking to solve is not defined in the report.

Further, there is no explanation offered as to why it was necessary to create a new method of calculating delay when there are two federal agencies that have models in place to do so. It should be noted that the FAA and DOT models have a wide divergence and now the Massport model offers a third divergent viewpoint. Which, if any model are we to believe, and why. Additional by creating a new model the ability to compare projected solutions with solutions that may have been implemented or will be offered at other airports around the country is lost. In essence we are unable to compare apples to apples. 49.4

- The report attempts to analyze the cost of delay and puts a $300 million dollar cost on all delay. By default the cost of delay caused the Northwest wind condition must be somewhat less that $300 million dollars. However the report does not address the cost that residents of communities that live near the airport will experience in economic or quality of life terms. For instance, the total value of all real estate in Hull per the Massachusetts Department of Revenue is approximately $700 million dollars. If the proposed runway is constructed thus in part enabling additional 50,000 flights per year over Hull there will be a loss in property values. A conservative estimate of 10 percent would yield a $70 million dollar loss in value for Hull alone. They're at least seventeen communities that will be severely impacted by this proposal; the loss in real estate value will exceed well over a billion dollars. Additionally, there is a loss in the quality of life that is not fully reflected in the real estate value. The report is completely silent on this issue. The report should be rejected because there is an incomplete analysis of all the cost and benefits associated with the proposal. 49.5

- The flight tracks depicted in the EIR/EIS do not conform to actual flight tracks. Massport acknowledges that the actual fight tracks flown may vary significantly from the assigned flight tracks. The data for actual flight tracks flown and the corresponding noise levels were not incorporated into the modeling that produced projections regarding several types of impact, including noise, environmental impacts from fuel and fumes as well as air quality impacts over all affected communities. The report should be rejected because there is an inaccurate analysis of all the impacts of the projected flight paths associated with an additional runway. 49.6

- The report should be rejected because the preferred alternative is not the best alternative for reducing delay. Table 4.5-3 clearly illustrates that Alternative 2, an option that does not require building a runway has a greater impact on delay reduction than the preferred Alternative 1A. Alternative 2 puts in place "Peak Hour Pricing" that in essence charges the airlines a premium to land at premium hours. This alternative is far more equitable as the users of the airport would share some of the burden of the airport. Under the Alternative 1A many of the affected population may never use the airport but experience the full burden of the cost. Additionally, Peak Hour Pricing will help to promote Providence, Manchester and Pease Airports as more economical alternatives for some travelers thus further diminishing the adverse impacts of Logan on neighboring communities. Lastly, Peak Hour Pricing has a superior impact on air quality improvement as well as noise abatement. This option if further explored could lead to even greater reduction than outlined in the proposal and at a minimum MEPA should require an analysis with greater depth. 49.7 49.8 49.9

- The proposal projects operations through the year 2010. It indicates that by that time delay will significantly exceed current levels, total operations will have seen a dramatic increase and noise, air quality and impact to surrounding communities will not have improved. In short the building of a new runway dodges the bigger issues. How much is enough? What is the capacity of the airport? What do we do in 2011 when there are no more alternatives at Logan. The proposal is short-term solution to an issue that cries out for a long term solution and perspective. In the mid-nineteen seventies a court injunction was put in place agai8nst further expansion a Logan in the 25 years that have followed there have been two half-hearted attempts to seek a long term solution. Massport and all those responsible for seeking and executing long term solutions should not be allowed to continually provide nearsighted solutions without addressing the real issues. 49.10

Since the preparation of EIR/EIS several substantial developments have occurred that could dramatically alter the projections used in the report. These developments include:

- Operations at Providence and Manchester have exceeded Massport Projections considerably
- Pease Airport is completing a major expansion and is contracting with two major airlines for service
- Worcester Airport has just come under Massport's control and has upgraded its electronics to improve runway operations under all weather conditions.
- Governor Cellucci has committed to enhancing rail connections from Boston to TF Green Airport.
- New Bedford has offered to expand cargo service to its municipal airport.

49.11

Based on these new developments and the preceding issues we request that EIS/EIR be denied. In the event that denial is not granted then we request that the EIR/EIS be refereed back to Massport. Massport should at a minimum be required to address the inconsistencies and omissions outlined in this letter, the Community Advisory Committee' response and the numerous other letters in opposition. The regulatory agencies that have oversight of this process should demand that an undertaking that would impact the quality of life of over one million, or 1/6th of the Commonwealth's residents be comprehensive and complete. This proposal is neither.

Project Name:	**Logan Airside Improvements Planning Project**
Project Location:	**Boston-Logan International Airport-Boston / Winthrop**
Project Proponents:	**Massachusetts Port Authority, Federal Aviation Administration**
Project Number:	**EOEA No. 10458**

Dear Mr. Pugsley and Mr. Silva:

On behalf of the Town of Hull Board of Selectmen I am writing to voice the Town of Hull's opposition to the Draft Environmental Impact Report (EIR)/ Draft Environmental Impact Statement (EIS) filed by Massport and the Federal Aviation Administration. The Town of Hull objects to the construction of a new runway at Logan Airport for the following reasons.

- The base year for the documents calculations and projections is 1993. It is now 1999, using a base year that is six years old is inconsistent with sound planning principals as many of the underlying analysis and modeling require more current data to accurately project future outcomes. For instance, one of the project proponents, the FAA, shows that the percent of operations experiencing delay actually decreased from 1993 to 1998. The projections in the DELAYSIM model developed specifically for this project does not accurately reflect the current state of delay. The failure to use current data causes the model to severely overestimate delay. 49.1

  In addition the success of Providence, Manchester and now Pease airports are not reflected in 1993 data. The failure to fully capture the success of these alternatives calls into question the projections that are contained in the report. 49.2

- The document offers a lengthy discussion on delay but fails to fully articulate all the causes for delay. For instance it is impossible from reading the document to determine what percentage of delay is due to mechanical failure. Without a breakdown for the causes of delay the true scope of the Northwest wind caused delay cannot be fully defined. Even the statistics on weather delay do not stratify the delay data by type of weather. 1993 was one of the heaviest snow total winters on record. If there was a day that had a significant snowfall and strong winds how was delay attributed: to the wind direction or the snow fall? The document is silent on this issue. 49.3

The failure to fully define delay not only by type, length and cause but also to deviate from the FAA standard or the Department of Transportation (DOT) standard is cause to reject the report as the nature of the problem that Massport is seeking to solve is not defined in the report.

Further, there is no explanation offered as to why it was necessary to create a new method of calculating delay when there are two federal agencies that have models in place to do so. It should be noted that the FAA and DOT models have a wide divergence and now the Massport model offers a third divergent viewpoint. Which, if any model are we to believe, and why. Additional by creating a new model the ability to compare projected solutions with solutions that may have been implemented or will be offered at other airports around the country is lost. In essence we are unable to compare apples to apples. 49.4

- The report attempts to analyze the cost of delay and puts a $300 million dollar cost on all delay. By default the cost of delay caused the Northwest wind condition must be somewhat less that $300 million dollars. However the report does not address the cost that residents of communities that live near the airport will experience in economic or quality of life terms. For instance, the total value of all real estate in Hull per the Massachusetts Department of Revenue is approximately $700 million dollars. If the proposed runway is constructed thus in part enabling additional 50,000 flights per year over Hull there will be a loss in property values. A conservative estimate of 10 percent would yield a $70 million dollar loss in value for Hull alone. They're at least seventeen communities that will be severely impacted by this proposal; the loss in real estate value will exceed well over a billion dollars. Additionally, there is a loss in the quality of life that is not fully reflected in the real estate value. The report is completely silent on this issue. The report should be rejected because there is an incomplete analysis of all the cost and benefits associated with the proposal. 49.5

- The flight tracks depicted in the EIR/EIS do not conform to actual flight tracks. Massport acknowledges that the actual fight tracks flown may vary significantly from the assigned flight tracks. The data for actual flight tracks flown and the corresponding noise levels were not incorporated into the modeling that produced projections regarding several types of impact, including noise, environmental impacts from fuel and fumes as well as air quality impacts over all affected communities. The report should be rejected because there is an inaccurate analysis of all the impacts of the projected flight paths associated with an additional runway. 49.6

- The report should be rejected because the preferred alternative is not the best alternative for reducing delay. Table 4.5-3 clearly illustrates that Alternative 2, an option that does not require building a runway has a greater impact on delay reduction than the preferred Alternative 1A. Alternative 2 puts in place "Peak Hour Pricing" that in essence charges the airlines a premium to land at premium hours. This alternative is far more equitable as the users of the airport would share some of the burden of the airport. Under the Alternative 1A many of the affected population may never use the airport but experience the full burden of the cost. Additionally, Peak Hour Pricing will help to promote Providence, Manchester and Pease Airports as more economical alternatives for some travelers thus further diminishing the adverse impacts of Logan on neighboring communities. Lastly, Peak Hour Pricing has a superior impact on air quality improvement as well as noise abatement. This option if further explored could lead to even greater reduction than outlined in the proposal and at a minimum MEPA should require an analysis with greater depth. 49.7 49.8 49.9

- The proposal projects operations through the year 2010. It indicates that by that time delay will significantly exceed current levels, total operations will have seen a dramatic increase and noise, air quality and impact to surrounding communities will not have improved. In short the building of a new runway dodges the bigger issues. How much is enough? What is the capacity of the airport? What do we do in 2011 when there are no more alternatives at Logan. The proposal is short-term solution to an issue that cries out for a long term solution and perspective. In the mid-nineteen seventies a court injunction was put in place agai8nst further expansion a Logan in the 25 years that have followed there have been two half-hearted attempts to seek a long term solution. Massport and all those responsible for seeking and executing long term solutions should not be allowed to continually provide nearsighted solutions without addressing the real issues. 49.10

Since the preparation of EIR/EIS several substantial developments have occurred that could dramatically alter the projections used in the report. These developments include:

- Operations at Providence and Manchester have exceeded Massport Projections considerably
- Pease Airport is completing a major expansion and is contracting with two major airlines for service
- Worcester Airport has just come under Massport's control and has upgraded its electronics to improve runway operations under all weather conditions.
- Governor Cellucci has committed to enhancing rail connections from Boston to TF Green Airport.
- New Bedford has offered to expand cargo service to its municipal airport.

49.11

Based on these new developments and the preceding issues we request that EIS/EIR be denied. In the event that denial is not granted then we request that the EIR/EIS be refereed back to Massport. Massport should at a minimum be required to address the inconsistencies and omissions outlined in this letter, the Community Advisory Committee' response and the numerous other letters in opposition. The regulatory agencies that have oversight of this process should demand that an undertaking that would impact the quality of life of over one million, or 1/6th of the Commonwealth's residents be comprehensive and complete. This proposal is neither.

Code	Topic 1	Topic 2	Comment	Response
49.1	Analysis Assumptions/ Methodologies	Base Year	The base year for the documents calculations and projections is 1993. It is now 1999, using a base year that is six years old is inconsistent with sound planning principals as many of the underlying analysis and modeling require more current data to accurately project future outcomes... The projections in the DELAYSIM model developed specifically for this project does not accurately reflect the current state of delay. The failure to use current data causes the model to severely overestimate delay.	The Supplemental DEIS/FEIR provides updated information for 1998—the latest year for which actual Logan Airport data are available. 1993 was adopted as the base year when the Airside Improvement studies commenced in 1994. The primary function of the Base Year analysis is to calibrate the airfield operation models and environmental impact models. The benefits and impacts of the action alternatives (Alternatives 1, 1A, 2 and 3) are assessed by comparing these not with the base year, but with Alternative 4, the No-Action Alternative. The planning scenarios for 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 2010 to 2020 time frame.
49.2	Regional Transportation	Regional Airports	In addition the success of Providence, Manchester and now Pease airports are not reflected in 1993 data. The failure to fully capture the success of these alternatives calls into question the projections that are contained in the report.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
49.3	Delay	Model	The document offers a lengthy discussion on delay but fails to fully articulate all the causes for delay. For instance, it is impossible from reading the document to determine what percentage of delay is due to mechanical failure. Without a breakdown for the causes of delay the true scope of the Northwest wind caused delay cannot be fully defined.	The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
49.4	Delay	Model	Further, there is no explanation offered as to why it was necessary to create a new method of calculating delay when there are two federal agencies that have models in place to do so. It should be noted that the FAA and U.S. DOT models have a wide divergence and now the Massport model offers a third divergent viewpoint. Which, if any model are we to believe, and why. Additional by creating a new model the ability to compare projected solutions with solutions that may have been implemented or will be offered at other airports around the country is lost. In essence we are unable to compare apples to apples.	Chapter 4 of the Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays used in the Airside Project. Chapter 1 and Appendix C include a description of measures used by FAA and U.S. DOT to calculate delay, the limitations of those measures, an explanation of computer models for estimating flight delays, and historical delay data at Logan Airport and other major United States airports.
49.5	Noise	Impacts	...the report does not address the cost that residents of communities that live near the airport will experience in economic or quality of life terms...there is an incomplete analysis of all the cost and benefits associated with this proposal.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. According to 40 CFR Part 1502 Environmental Impact Statements Regarding Cost-Benefit analysis " for purposes of complying with the act, the weighing of the merit and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis..." In fact, the FAA models tend to overstate delays since they use weighted averages rather than continuous weather conditions.
49.6	Noise	Impacts	The flight tracks depicted in the EIR/EIS do not conform to actual flight tracks. Massport acknowledges that the actual flight tracks flow may vary significantly from the assigned flight tracks. The data for actual flight tracks flown and the corresponding noise levels were not incorporated into the modeling that produced projections regarding several types of impact, including noise, environmental impacts from fuel and fumes as well as air quality impacts over all affected communities.	The flight tracks used in the model were derived from radar data depicting actual flight tracks to be representative of the entire set of actual tracks. The tracks that were derived for departure operations off each runway represent the dispersion and turns of the actual tracks. The use of each derived track is weighted to reflect the actual use. It is believed that the number of tracks used in this study and in the Logan Airport 1999 ESPR (previously GEIR) leads to greater accuracy in estimating the noise impacts than is obtained with fewer tracks used in studies at many other airports.
49.7	Alternatives	Preferred Alter native	...the Preferred Alternative is not the best alternative for reducing delay... Alternative 2, an option that does not require building a runway, has a greater impact on delay reduction than the Preferred Alternative IA. Alternative 2 puts in place "Peak Hour Pricing" that in essence charges the airlines a premium to land at premium hours. This alternative is far more equitable as the users of the airport would share some of the burden of the airport.	The Airside analysis indicates that Peak Period Pricing is an effective option when airline's schedule beyond the normal hourly operating capacity of the airport. Peak Period Pricing is not recommended for implementation at this time, because airline overscheduling is not a major contributor to current delays at Logan Airport. However, as a mitigation measure, Massport has proposed to implement a Peak Period Monitoring System to determine if airline overscheduling is emerging based on future growth in aircraft operations. Massport believes that initiation of this monitoring program will provide the necessary market signals to encourage carriers to make efficient use of available facilities at Logan Airport. Should the monitoring program indicate that overscheduling conditions are likely to develop, Massport is prepared to initiate a process, as described in Section 4.5.4 of the Supplemental Draft EIS/Final EIR, to initiate the rule-making process to implement Peak Period Pricing at that time.

Code	Topic 1	Topic 2	Comment	Response
49.8	Alternatives	Peak Period Pricing	...Peak Hour Pricing will help to promote Providence, Manchester and Pease Airports as more economical alternatives for some travelers thus further diminishing the adverse impacts of Logan on neighboring communities.	Additional analysis of PPP is set out in Section 4.5 the Supplemental DEIS/FEIR. While the regional airports at Manchester and T.F. Green/Providence have experienced exceptional traffic growth over the past several years, traffic at Logan Airport has continued to grow. In the future, continued development at the regional airports should relieve some of the traffic growth pressures at Logan Airport, resulting in a reduced rate of traffic growth. Nevertheless, regional alternatives do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Refer to response to Comment 6.17.
49.9	Alternatives	Peak Period Pricing	...Peak Hour Pricing has a superior impact on air quality improvement as well as noise abatement.	The potential impact of PPP on the fleet mix at Logan Airport is discussed in Section 4.5 of the Supplemental DEIS/FEIR.
49.10	Analysis Assumptions/ Methodologies	Planning Period	The proposal projects operations through the year 2010. It indicates that by that time delay will significantly exceed current levels, total operations will have seen a dramatic increase and noise, air quality and impact to surrounding communities will not have improved...What do we do in 2011 when there are no more alternatives at Logan...Massport and all those responsible for seeking and executing long term solutions should not be allowed to continually provide nearsighted solutions without addressing the real issues.	Section 1.4 and Appendix C of the Supplemental DEIS/FEIR contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals. Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
49.11	Regional Transportation	Regional Airports	...several substantial developments that have occurred [since the preparation of EIR/EIS] that...dramatically alter the projections used in the report [and should be considered]. These developments include: operations at Providence and Manchester have exceeded Massport Projections considerably; Pease Airport is completing a major expansion and is contracting with two major airlines for service; Worcester Airport has just come under Massport's control and has upgraded its electronics to improve runway operations under all weather conditions; New Bedford has offered to expand cargo service to its municipal airport; Governor Cellucci has committed to enhancing rail connections from Boston to T.F. Green Airport.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Town of Hull
225 Atlantic Avenue
Hull, Massachusetts 02045

Planning Board
781-925-2117

April 21, 1999

LETTER 50

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street 20th floor
Boston, MA 02205

Re: **OPPOSED to Runway 14/32**

Dear Mr. Pugsley:

I am writing on behalf of the Town of Hull Planning Board to express our strong opposition to Massport's proposed new runway, 14/32. Our concern is that the new runway will allow more flights into and out of Logan Airport. As elected officials, we believe that Runway 14/32 will substantially increase the air traffic over our community which will result in significant negative impact to our quality of life and the economics of our town. 50.1

The Town of Hull has been undergoing a renaissance over the past several years. We have developed a vision statement for our community that defines our goals and aspirations for Hull. The elected officials and citizens have worked diligently with many Commonwealth of Massachusetts agencies to develop an Economic Master Plan, a Harbor Management Plan, and an Open Space and Recreation Plan. We are one of only a few communities in the state that have an approved Open Space and Recreation Plan and we will soon be one of only a few communities that will have a Harbor Management Plan. We have also seen a significant investment by the MDC in our community to revitalize Nantasket Beach.

As you can see, we have made a significant investment in our community. The result has been a positive impact on Hull's fiscal position and improved socioeconomics of our community. The increase in noise and air pollution as a result of Runway 14/32 will negate many of the benefits we have been able to achieve from our efforts.

Government is by the people and for the people. Government agencies should not be independent from the will of the people. Elected officials and surrounding communities have voiced their opposition to this new runway. Please consider the negative impact that Runway 14/32 will have in terms of quality of life and economics for all of the surrounding communities. Most importantly, please heed the voice of the people. Thank you.

Sincerely,

David P. Carlon

50.1	Alternatives	Runway 14/32	...we believe that Runway 14/32 will substantially increase the air traffic over our community which will result in significant negative impact to our quality of life and the economics of our town.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, and Hull is affected by the use of Runway 33/32 arrivals. The total number of aircraft arriving to the northwest does increase with construction of the runway, but this is due to the PRAS goals more than any other factor. Since the Runway 33 arrivals that impact Hull approach primarily over water, and since Hull is further from the airport than those communities impacted by arrivals to Runway 15L/R, 4L/R, or 22L/R, the PRAS goals call for 42 percent of the equivalent arrivals to operate in this direction. Runway 33 arrivals accounted for approximately 27 percent of the equivalent arrivals in 1998, and since Logan Airport has a limited capacity in this direction, the northwest configuration has been underutilized as demand has increased over the years. Construction of the runway allows better achievement of the agreed-upon PRAS goals, but even with Runway 14/32, the equivalent arrivals in the Runway 33/32 direction never reach the goal of 42 percent under any fleet scenario or alternative. Operations in the vicinity of Hull increase with the Preferred Alternative primarily due to aircraft landing to the northwest, either on new Runway 32 or because of greater use of Runway 33L. However, the noise exposure levels resulting from these increased operations remains several decibels below 60 DNL as indicated by the specific point analysis at Site 26 in Tables 6.2-8, 6.2-9, 6.2-22, and Appendix E-1 of the Supplemental DEIS/FEIR. These levels are nearly 20 dB below the highest exposure in Winthrop and 15 dB below the exposure in parts of East Boston and Revere, which the new runway would help to improve.

Boston, MA 02202

Mr. John Silva
Manager, Environmental Programs
Airport Division
New England Region
12 New England Executive Park
Burlington, MA 01803

Dear Mr. Pugsley and Mr. Silva:

On behalf of the Town of Nantucket, I write to you today to express the Town of Nantucket's support of Massport's preferred alternative for reducing delays at Logan International Airport and to reaffirm our strong opposition to peak period pricing.

Although efforts to reduce congestion and delay are laudable, the method chosen is poorly conceived and potentially disastrous for the Massachusetts regional airports that depend on efficient economical air service for community success. We can agree on the need for a new runway to ease congestion, but tying it to peak period pricing is not acceptable.

Nantucket, other Cape and Island communities, and smaller cities throughout New England are dependent on Logan as the "hub" of a "hub and spoke" system of airports which acts as a gateway to the rest of the world. To place high fees on the regional airlines upon which we are dependent for tourist and business travel during the hours when most people need to travel, is to deny us a fair chance at economic survival. 51.1

Nantucket enplanes more passengers than any other airport in Massachusetts after Logan. We are the fifth among all cities in New England in that same regard. This proposed fee structure will harm our residents and visitors severely because of the increase in landing fees for the smaller

aircraft which serve us and other Cape and Island communities. Those fees must be passed on to the traveler. The effect will be to send the discretionary traveler elsewhere, and for off-season service to be eliminated or curtailed.

Nantucket is working along with the other commercial service airports of Massachusetts to convince MASSPORT to eliminate peak period pricing as an option. The five airports of the Cape and Islands contribute 100% of the intrastate commercial airline passengers who will be affected adversely by this proposition. The actions by MASSPORT to curtail travel in a time of economic recovery for the State is unconscionable.

Sincerely,

Arthur L. Desrocher

51.1	Alternatives	Peak Period Pricing	On behalf of the Town of Nantucket, I write to you today to express the Town of Nantucket's support of Massport's Preferred Alternative for reducing delays at Logan International Airport and to reaffirm our strong opposition to peak period pricing...To place high fees on the regional airlines upon which we are dependent for tourist and business travel during the hours when most people need to travel, is to deny us a fair chance at economic survival...This proposed fee structure will harm our residents and visitors severely because of the increase in landing fees for the smaller aircraft which serve us and other Cape and Island communities. Those fees must be passed on to the traveler. The effect will be to send the discretionary traveler elsewhere, and for off-season service to be eliminated or curtailed.	Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England. Massport considers Logan Airport to be part of a regional system of airports that includes T.F. Green/Providence, Manchester and Worcester Regional airports. Service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate growth in air travel demand. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of the roles of Logan Airport and these regional airports in the eastern New England aviation system.

EOEA #10458

Dear Sirs:

On behalf of the Town of Orleans, the Board of Selectmen would like to comment on the Draft Environmental Impact Report (EIS/EIR) for the Logan Airside Improvements Planning Project. We concur with the findings and conclusions in the report that Peak Period Pricing is not an appropriate strategy for reducing aircraft delay at Logan Airport and therefore should be eliminated from further consideration.

The economic and environmental well being of Cape Cod's residents and businesses depends on continued safe and efficient air transportation access to Logan. Peak Period Pricing, if implemented, would create a severe hardship on airlines such as Cape Air that use small aircraft and would increase automobile travel between Cape Cod and Boston, adding to the congestion at the Bourne and Sagamore Bridges, on Route 3 and Route 6. In addition, for the communities of the Outer Cape, the potential loss of air carrier service by Cape Air as a result of Peak Period Pricing would threaten the health and safety of residents by eliminating medical care flight service that many rely on, forcing ambulances to drive up to an hour away to Cape Cod Hospital and two and one half hours to Boston.

52.1

Thank you for the opportunity to comment on this report.

Very truly yours,

Beverly G. Singleton, Chairman
Orleans Board of Selectmen

Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England. A conceptual exemption program designed to protect services to small communities most reliant on Boston for access to the national air transport system is described in Section 4.5 of the Supplemental DEIS/FEIR.

SUBJ: Logan Airside Improvements Planning Project: *Provincetown Supports Runway 14/32 in Alternative 1A, But Opposes Peak Period Pricing at Logan Airport*

Dear Sirs:

The Town of Provincetown and its Board of Selectmen wish strongly to support the proposal for construction of a new unidirectional runway 14/32 at Logan Airport, contained in Alternative 1A of the Draft Environmental Impact Report/Impact Statement for the Logan Airside Improvements Planning Project. We wish to be on record in support of the preferred alternative which the DEIR/IS finds as the single most effective action in addressing weather-related delays at Logan.

With that said, however, Provincetown wishes strongly to oppose any inclusion of peak period pricing in Alternative 1A or otherwise. As we have long said, peak period pricing could seriously– perhaps fatally– undermine the economic viability of Provincetown Municipal Airport. The Cape Cod Commission's Transportation Committee has cited prior Massport consultant findings of the "real possibility" that peak-period pricing could put Cape Air out of business. From Provincetown's unique perspective– since Cape Air operates our municipal airport under the auspices of our Airport Commission– putting Cape Air out of business has the "real possibility" of putting Provincetown Municipal Airport out of business. For Provincetown-- where the closest ambulance drive is an hour away to Cape Cod Hospital and two-and-a-half hours away to Boston– the loss of our airport would fundamentally threaten the health and safety of our residents. We cannot allow that to happen.

53.1

Thank you for your consideration.

Sincerely,

Keith A. Bergman
Town Manager

Re; Logan Airport Airside Improvements

Dear Sirs:

The Provincetown Airport Commission is putting our full support behind the proposed construction of the unidirectional runway 14/32 at Logan International Airport. This item is found in the Draft Environmental Impact Report / Impact Statement for Logan Airport Airside Improvements Planning Project (Alternative 1A). We are convinced that the unidirectional runway is the most effective way to address traffic delays at Logan. This is especially important during weather delays.

The Provincetown Airport Commission also wants to be put on record that we strongly oppose any inclusion of Peak Period Pricing in Alternative 1A of the Logan DEIR/IS and any other Peak Period Pricing information or planning in the future. We believe Peak Period Pricing would devastate the Provincetown Municipal Airport and very possibly drive our only commuter air carrier (Cape Air) out of the Provincetown market or even out of business. We all know how fragile the economic viability of Lower Cape Cod is and when you add the health and safety of our residents and tourists we cannot allow this to happen.

Re: Logan Airport Expansion Resolve

Dear Ms. Garvey:

Enclosed please find a copy of the Resolve I introduced at the Quincy City Council meeting April 5, 1999, entitled "Resolutions Indicating City of Quincy Opposition To Airside Expansion At Logan Airport And Construction Of Runway 14-32". This Resolve was unanimously passed.

Sincerely,

Bruce J. Ayers,
WARD SIX COUNCILLOR

LETTER 55

RESOLUTIONS INDICATING CITY OF QUINCY OPPOSITION TO AIRSIDE EXPANSION AT LOGAN AIRPORT AND CONSTRUCTION OF RUNWAY 14-32

WHEREAS, the Massachusetts Port Authority operates Logan International Airport and has initiated plans to increase airplane capacity through the construction of an additional runway known as "14-32" by its navigational compass points; and

WHEREAS, the stated reason for construction of this proposed new runway is to reduce delays at Logan Airport; and

WHEREAS, Massport is forecasting such a significant increase in the overall number of aircraft operations over the next five years that delays will reach current levels within that time even if the runway expansion is undertaken; and

WHEREAS, Massport has not fully examined alternatives to airport expansion like diverting more cargo and planes to Hanscom Field and Worcester Airport; and 55.1

WHEREAS, Massport has not yet fully investigated other ways to alleviate the strain on capacity at Logan like increasing transportation access to other regional airports like T.F. Green in Rhode Island and Manchester Airport in New Hampshire; and 55.2

WHEREAS, Massport has not taken advantage of certain internal management tools that could be used to alleviate delays such as a Peak Period Management Program that would save money for those passengers who can travel at a time when the airport typically experiences less service demand and less delays; and 55.3

WHEREAS, Massport has indicated that operation of the new runway would impact several neighborhoods in the City of Quincy, especially, Squantum, West Quincy, North Quincy, Germantown, Houghs Neck, Merrymount, Montclair, Quincy Point and Wollaston; and 55.4

WHEREAS, Massport has not conducted or officially offered to hold any local meetings to better explain this project to our residents, listen to their concerns and to answer their complaints about current problems with air traffic noise and air pollution; and 55.5

WHEREAS, Massport has already filed an Environmental Impact Statement with the support of the Federal Aviation Administration (FAA) to secure the environmental approvals necessary to begin construction on this project; and

WHEREAS, two public hearings will be held this week to discuss the environmental impact that expansion of Logan Airport would cause; and

WHEREAS, all plans to expand Logan Airport must be approved by federal environmental regulators before any construction activity can begin; and

WHEREAS, the City Council of the City of Quincy agrees with the concerns of its citizens about increased noise, vibration and potential health and safety hazards that arise from additional airline traffic and has serious reservations about the need and benefits of proposed runway 14-32; therefore be it

55.6

RESOLVED, that the City Council hereby requests the Federal Aviation Administration to withdraw its support for expansion of Logan Airport at least until the questions of neighboring communities have been answered in better detail; and be it further

RESOLVED, that the addition of more air traffic over the city is unacceptable and the City Council strongly urges that the transportation and environmental needs of the metropolitan Boston area be reviewed in a much broader scope than the proposal currently under consideration; and be it further

55.7

RESOLVED, that in order to take steps to help preserve quality-of-life in our community, the City Council records it objection to expansion of Logan Airport by means of this resolution and urges that it not be granted authorization to proceed; and be it finally

RESOLVED, that the Clerk of the City of Quincy forward a copy of these resolutions to the following parties:

- Mayor James A. Sheets
- Congressman William D. Delahunt, 24 Cottage Avenue, Quincy, MA 02169
- Senator Michael W. Morrissey, The State House, Room 413-E, Boston, MA 02133
  Representative A. Stephen Tobin, The State House, Room 166
  Representative Ronald Mariano, The State House, Room 234
  Representative Liz Malia, The State House, Room 540
- Jane Garvey- Administrator, Federal Aviation Administration, 800 Independence Avenue, SW, Washington, D.C. 20591
- Peter I. Blute, Executive Director and CEO, Massachusetts Port Authority, One Harborside Drive, Suite 200, East Boston, MA 02128
- Betty Desrosiers, Director of Aviation Planning, Massachusetts Port Authority, One Harborside Drive, Suite 200, East Boston, MA 02128

City joins Logan runway opposition

Council asks U.S. to block construction

GAVIN McCORMICK
Patriot Ledger

QUINCY — City councilors last night added Quincy's voice to the chorus of communities protesting the addition of a runway at Logan International Airport.

In unanimous vote the council asked federal environmental officials to block construction of a new $22 million runway, which councilors said would increase air traffic over several Quincy neighborhoods.

The Massachusetts Port Authority, which

[redacted]

[redacted] Quincy neighborhoods are directly in the path of this runway," Ward 4 Councilor Michael D'Amico, said. "This would directly impact the quality of life in our neighborhoods. It's important for the city to go on record as being opposed."

Massport officials have pledged that the runway would serve only planes approaching and departing over the Atlantic Ocean.

Their plan would boost traffic over Hull but cut the number of planes flying over Quincy, Braintree, Weymouth, parts of Hingham and most parts of Milton.

But while Massport has said it plans to use the runway largely for small planes and only in one direction — toward Boston Harbor — city officials and some residents fear that will change as plane traffic increases over the decade.

"Logan simply can't continue to exp within the city of Boston," Councilor-at-l Paul Harold said. "The only city in the w with a major airport in the middle of the was Hong Kong, and the Chinese just clo that. There's a need for a second airp especially for cargo and small passenger tr fic."

City Council President Peter Kolson a the runway would increase flights 10-fold o Germantown and Houghs Neck. He pledged testify against the plan at environmen hearings.

Code	Topic 1	Topic 2	Comment	Response
55.1	Regional Transportation	Regional Airports	...Massport has not fully examined alternatives to airport expansion like diverting more cargo and planes to Hanscom Field and Worcester Airport...	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and full use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport. Federal constitutional provisions, federal aviation statutes and regulations, and contractual provisions related to Federal Airport Improvement Program grants prevent Massport from any control over airline rates, routes, and schedules. Congress has specifically forbidden airport operators from exercising any discriminatory action against any class of airport users. Major factors in airline competition are frequency of service and number of markets served, and Massport has no ability to force airlines to consolidate or eliminate flights to influence load factor or aircraft size.
55.2	Alternatives	Regional Airports	...Massport has not yet fully investigated other ways to alleviate the strain on capacity at Logan like increasing transportation access to other regional airports like T.F. Green in Rhode Island and Manchester Airport in New Hampshire...	Massport is supportive of ground transportation improvements to the regional airports, The MassHighway is analyzing alternative routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport. MassHighway is in the process of preparing the EIS/EIR for these highway improvements. Massport supports this project.
55.3	Alternatives	Peak Period Pricing	...Massport has not taken advantage of certain internal management tools that could be used to alleviate delays such as a Peak Period Management program that would save money for those passengers who can travel at a time when the airport typically experiences less service demand and less delays;....	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain an analysis of PPP as a demand management alternative at Logan Airport. Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
55.4	Noise	Impacts	...Massport has indicated that operation of the new runway would impact several neighborhoods in the City of Quincy, especially Squantum, West Quincy, North Quincy, Germantown, Houghs Neck, Merrymount, Montclair, Quincy Point and Wollaston;....	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. Similarly, overflights affecting Winthrop (Runway 27 arrivals and Runway 9 departures) will decline from 88,224 in 1998 to 55,805. As a result of the relief for these communities, flights over the water and flights over less impacted communities will increase.
55.5	Environmental Review Process	Public Process	...Massport has not conducted or officially offered to hold any local meetings to better explain this project to our residents, listen to their concerns and to answer their complaints about current problems with air traffic noise and air pollution;....	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
55.6	Alternatives	Runway 14/32	...the City Council of the City of Quincy agrees with the concerns of its citizens about increased noise, vibration and potential health and safety hazards that arise from additional airline traffic and has serious reservations about the need and benefits of proposed Runway 14/32;....	A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.
55.7	Environmental Review Process	MEPA	...the addition of more air traffic over the city in unacceptable and the City Council strongly urges that the transportation and environmental needs of the metropolitan Boston area be reviewed in a much broader scope than the proposal currently under consideration;....	The goals of the Airside Project are to reduce delay, increase the airport's efficiency, and improve airfield safety in an environmentally responsible manner. Unidirectional Runway 14/32 would also give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals, and redirect many flights to overwater routes. During very high demand periods, the controllers currently have little or no flexibility for runway selection. The addition of Runway 14/32 would be the single most important mechanism to achieve equitable geographic distribution of aircraft operations. Massport and the FAA are committed to the PRAS system and have been making improvements since 1982.

LETTER 56

April 12, 1999

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 022025

RE: Draft EIR Logan Airside Improvements Planning Projects - EOEA #10458

Dear Mr. Pugsley:

The City of Revere Department of Planning and Community Development in conjunction with the Mayor's Office has reviewed the above referenced EIR and offers the following comments:

Massport's prediction that the airport will grow from the 1996 level of 25 million to between 37.5 million and 45 million passengers per year by 2010 can only result in a substantial increase in air traffic and attempts to increase capacity at Logan. This no doubt will be the case should Massport not aggressively pursue a realistic plan to coordinate this projected growth in operations with other airports accessible to the Boston metropolitan area within the Route 495 belt. This growth factor is of grave concern to the City of Revere given its geographical and topographical relation to Logan Airport. In particular, the Beachmont neighborhood is only 1 1/2 miles from the touchdown point on Runway 22 Left and is presently heavily impacted by air traffic. In general, any attempts to add air traffic and increase operations at Logan to the already overburdened schedule will be harmful to Revere in terms of both noise and operational difficulties including increased vehicular traffic through the community.

The proposed airside improvements and administrative modifications outlined in the EIR are designed to accomplish one purpose - the need to accommodate more air traffic at Logan. If this is accomplished, it will be at the expense of the health, safety and welfare of neighboring communities.

Proposed Lowering of Weather Minimums for Landing on Runway 22L

Lowering the decision heights for landing on Runway 22 Left in poor visibility weather would allow greater air traffic over the Beachmont Hill under poor visibility conditions. The present decision height is 420 ft. and is directly over Beachmont Hill along the glideslope. Aircraft which are told to abort landings due to poor visibility would not impact Beachmont Hill - meaning there would be less aircraft flying over Beachmont Hill in poor visibility conditions. With the decision height brought down to 217 ft. along the glideslope, more air traffic would be flying over Beachmont Hill under worse weather conditions. In poor visibility weather the pilots do not have to see Beachmont Hill in their approach. Given the already narrow envelope between the existing approach path at the top of Beachmont Hill, it is feared that a lowered decision height would increase the potential of a hazard for Beachmont residents during poor visibility conditions. 56.1

Proposed Runway 14-32

Runway 14-32 as proposed would allow Logan to become more efficient during moderate to strong northwest winds and allow more flexibility in shifting air traffic away from Runway 22 Left which has the greatest impact on Revere. Revere is more concerned with the implications an additional runway would have on additional air traffic than Massport's proposal to just make existing operations more efficient. The EIR is not totally convincing that less air traffic would result over Revere with the construction of Runway 14-32. It appears the new runway will increase airport capacity at Logan which will obviously result in increased air traffic over Logans neighboring communities. 56.2

Proposed Centerfield Taxiway

The new Centerfield Taxiway will not alleviate traffic on other runways. This proposal would allow for additional aircraft to occupy runways which would in turn increase airport congestion during take offs and landings. This scenario would only further impact the neighboring communities of Revere, Winthrop and East Boston by allowing more flights under tighter conditions. 56.3

Peak Period Pricing

Peak period pricing would have a negative financial impact imposed on the smaller commuter airlines and the communities they serve. This would impact commuter flights and possibly limit these flights during peak periods allowing for increased larger jet traffic. 56.4

In addition to the aforementioned comments, the following mitigation measures must be improved within the City of Revere:

- The air pollution monitor is placed at the shore near the ocean where particulate matter dissipates. This location does not provide for a true reading on air pollution, therefore the monitor should be relocated to a more appropriate location. 56.5

- A new noise monitor is needed at the playing fields of the Beachmont School where school children are effected. 56.6

- Aircraft continues to cause considerable soot over the Beachmont area. This must be monitored and analyzed more carefully by Massport. 56.7

- The soundproofing program must be expanded beyond the 65db contour to include such areas as Point of Pines, Shirley Avenue Hill and the rest of Beachmont and the Beachfront. Central airconditioning should be included in the scope of the soundproofing program within the more impacted areas. 56.8

- The need exists to firmly enforce the regulation of flights between 10 pm and 7 am and recertification for Stage 3 aircraft. Many aircraft have been recorded over 95db between 10 pm and 7 am. Over 95db is extremely loud, especially in nighttime and early morning conditions. A definite need exists for recertification if aircraft cannot stay within current noise limits. 56.9

Revere is impacted by Logan Airport in many ways and the need exists for a clear understanding of the valid concerns raised in these comments and assurance of the implementation of the necessary mitigation measures. Given the long history of conflicts with Massport's plans to increase capacity and efficiency at Logan, it is clear that the demands placed on Logan must continue to be distributed to underutilized regional airports.

Respectfully,

Frank Stringi

Code	Topic 1	Topic 2	Comment	Response
56.1	Alternatives	Reduced Approach Minimums	Lowering the decision heights for landing on Runway 22 Left in poor visibility weather would allow greater air traffic over the Beachmont Hill under poor visibility conditions...With the decision height brought down to 217 ft. along the glideslope, more air traffic would be flying over Beachmont Hill under worse weather conditions...Given the already narrow envelope between the existing approach path at the top of Beachmont Hill, it is feared that a lowered decision height would increase the potential of a hazard for Beachmont residents during poor visibility conditions.	Reducing the current landing minimums for Runway 22L at Logan Airport does not equate to a reduction in the existing levels of safety and doesn't change noise levels. Aircraft would follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made would be moved closer to the airport. Both Appendix D and Section 3.4 include discussions of reduced minimums. Figure 3.4-1 and Figure 3 of Appendix D of the Supplemental DEIS/FEIR show that even under existing approach minimums, aircraft are already beyond Beachmont Hill before reaching the decision height.

Code	Topic 1	Topic 2	Comment	Response
56.2	Alternatives	Runway 14/32	Revere is...concerned with the implications an additional runway would have on additional air traffic...The EIR is not totally convincing that less air traffic would result over Revere with the construction of Runway 14/32. It appears the new runway will increase airport capacity at Logan which will obviously result in increased air traffic over Logan's neighboring communities.	Implementation of unidirectional Runway 14/32 significantly reduces the most severely impacted populations within the 70 and 75 dB noise contours in Winthrop and Revere (refer to Section 6.2 of the Supplemental DEIS/FEIR). Revere is nearest the flight paths of Runway 4L/R departures and Runway 22L/R arrivals. The Supplemental DEIS/FEIR indicates that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals, reducing the current dependence on northeast/southwest operations. This will lead to a decreased percentage of equivalent operations over Revere. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals, cutting dwell and persistence over Revere significantly. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated by passenger or airlines, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts examined in the airside operational and environmental analyses would capture any potential variation in future passenger and aircraft activity at Logan Airport.
56.3	Alternatives	Taxiway Improvements	The new Centerfield Taxiway will not alleviate traffic on other runways. This proposal would allow for additional aircraft to occupy runways which would in turn increase airport congestion during takeoffs and landings. This scenario would only further impact the neighboring communities of Revere, Winthrop and East Boston by allowing more flights under tighter conditions.	The purpose of the proposed Centerfield Taxiway system is to improve the flow of taxiing aircraft and to reduce aircraft ground delay. With the Centerfield Taxiway in place, neighbors in Winthrop and East Boston adjacent to the taxiways will experience small reductions in ground noise. These are different from the noise level reductions that occur in parts of East Boston, Revere, South Boston, and Dorchester with the Preferred Alternative. Improvements in those communities are derived from the added flexibility afforded by Runway 14/32. It allows the redistribution of traffic so that there are fewer landings on Runway 4L and 4R and fewer takeoffs on Runways 22L and 22R. The taxiway itself has no bearing on these flights. Dispersion Modeling indicates no violations of the NAAQS at any of the sites shown on Figure 6.3-1 of the Supplemental DEIS/FEIR, including those at public beaches and recreational areas.

Code	Topic 1	Topic 2	Comment	Response
56.4	Alternatives	Peak Period Pricing	Peak period pricing would have a negative financial impact imposed on the smaller commuter airlines and the communities they serve. This would impact commuter flights and possibly limit these flights during peak periods allowing for increased larger jet traffic.	The Airside analysis indicates that PPP is an effective option when airline's schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP Exemption Program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.
56.5	Air Quality	Monitoring	The air pollution monitor is placed at the shore near the ocean where particulate matter dissipates. This location does not provide for a true reading on air pollution, therefore the monitor should be relocated to a more appropriate location.	The closest PM_{10} monitor, located and operated by the DEP, is on Bremen Street. In the Supplemental DEIS/FEIR, receptor sites, some near the ocean-side residential communities adjacent to Logan Airport, were modeled with real meteorological conditions.
56.6	Noise	Monitoring	A new noise monitor is needed at the playing fields of the Beachmont School where school children are affected.	Requests for new noise monitors should be addressed to Massport.
56.7	Air Quality	Soot	Aircraft continues to cause considerable soot over the Beachmont area. This must be monitored and analyzed more carefully by Massport.	Although PM_{10} emission factors for aircraft are generally not available, a conservative estimate was used for the Supplemental DEIS/FEIR. The dispersion modeling indicates there will be no violations of the NAAQS for fine PM_{10}. The modeling included Logan Airport emissions and background emissions. Furthermore, PM_{10} in urban areas is composed of compounds from a variety of sources, primarily roadways. Monitoring of airborne soot levels in the vicinity of Logan Airport has shown that the airport is a very small (less than 1 percent) contributor. The air quality analysis, based on EPA/DEP models and guidelines, is considered to be comprehensive and state-of-the-art.

Code	Topic 1	Topic 2	Comment	Response
56.8	Noise	Sound Insulation	The soundproofing program must be expanded beyond the 65 dB contour to include such areas as Point of Pines, Shirley Avenue Hill and the rest of Beachmont and the Beachfront. Central air conditioning should be included in the scope of the soundproofing program within the more impacted areas.	Logan Airport has one of the most comprehensive and progressive sound insulation programs of any airport in the country. It was initiated in 1980 before any airport began receiving federal funding to soundproof homes under FAR Part 150. It is the only program in the country to offer residents extra sound insulation treatment in a "room of preference" chosen by the homeowner and it is the only program in the country attempting to receive FAA approval to expand the area of eligibility by accounting for hill effects. In addition, as of the 1999–2000 construction season, FAA grants covering 80 percent of the cost of sound insulation (paid for by airline ticket taxes), combined with funds provided by Massport through Passenger Facility Charges and landing fees, had fully funded the sound insulation of all eligible dwelling units in Massport's current sound insulation program. Despite this accomplishment, Massport continues to seek means of expanding its sound insulation program exclusive of FAA's decision on this Supplemental DEIS/FEIR. If the FAA approves the Preferred Alternative, Massport is committed to expanding the program to include all additionally eligible residences. Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update.* Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.
56.9	Noise	Nighttime Noise	The need exists to firmly enforce the regulation of flights between 10 pm and 7 am and recertification for Stage 3 aircraft. Many aircraft have been recorded over 95db between 10 PM and 7 AM. Over 95db is extremely loud, especially in nighttime and early morning conditions. A definite need exists for recertification if aircraft cannot stay within current noise limits.	In addition, Massport is committed to exploring other measures to reduce nighttime noise whether or not the Preferred Alternative is implemented.

LETTER 57

April 15, 1999

Secretary of Environmental Affairs
Mr. Arthur Pugsley - IOEA No 10458
100 Cambridge Street
20th Floor
Boston, MA 02202

Attention: MEPA Office

Dear Mr. Pugsley:

On February 19, 1999 the City of Revere received the Draft Environmental Impact Statement and Draft Environmental Impact Report ("Draft EIS/EIR") relative to the Logan Airside Improvements Planning Project, ("Project"), submitted by the Massachusetts Port Authority and the Federal Aviation Administration.

Upon receiving the "Draft EIS/EIR" the City of Revere requested the Massachusetts Port Authority to provide the City of Revere with the financial assistance to evaluate the "project" impact on the City.

Inasmuch as the City of Revere has not received a response to its request from the project proponents, on April 05, 1999 the Revere City Council adopted the following resolution:

Whereas: The Massachusetts Port Authority has not responded to Revere City Council Order #99-73, requesting that the Massachusetts Port Authority provide the City of Revere with funding to review the impact of the Draft Environmental Impact Report (Logan Airside Improvements) dated February 19, 1999; and 57.1

Whereas: the further expansion of Logan International Airport will result in additional landings and take-offs at Logan resulting in additional adverse noise impact to the City of Revere; and 57.2

Whereas: the Massachusetts Port Authority has declined, thus far, the City of Revere's invitation to work with the City to address the City's concerns about noise pollution impacts from jets landing and taking off at Logan Airport. 57.3

Now, Therefore, Be It Resolved: That the City of Revere record its opposition to further expansion at Logan Airport as, contained in the Massachusetts Port Authority's Draft Environmental Impact Report and further that the City of Revere join with the Mayor of the City of Boston, the Honorable Thomas M. Menino, in calling for a moratorium on airport expansion until an independent commission can develop a regional transportation strategy. 57.4

Please include the City of Revere's comments as a response to the "project Draft EIS/EIR".

Very truly yours,

John J. Henry
City Clerk
on behalf of the Revere City Council

c: City Council
Mayor
C.O. 99-73/99-73A

Letter 57
City of Revere, Revere City Council

Code	Topic 1	Topic 2	Comment	Response
57.1	Environmental Review Process	Public Process	...The Massachusetts Port Authority has not responded to Revere City Council Order #99-73, requesting that the Massachusetts Port Authority provide the City of Revere with funding to review the impact of the Draft Environmental Impact Report (Logan Airside Improvements) dated February 19, 1999,....	To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Revere is represented in the CAC.
57.2	Noise	Impacts	...the further expansion of Logan International Airport will result in additional landings and take-offs at Logan resulting in additional adverse noise impact to the City of Revere;....	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.

Code	Topic 1	Topic 2	Comment	Response
57.3	Environmental Review Process	Public Process	...the Massachusetts Port Authority has declined, thus far, the City of Revere's invitation to work with the City to address the City's concerns about noise pollution impacts from jets landing and taking off at Logan Airport.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

Code	Topic 1	Topic 2	Comment	Response
57.4	Environmental Review Process	Blue Ribbon Panel	...the City of Revere...[calls] for a moratorium on airport expansion until an independent commission can develop a regional transportation strategy.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. A total of 12 meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. As summarized in the Airside Project Draft EIS/EIR, a number of studies that address regional transportation planning issues have been conducted over the last ten years. These studies have concluded that the Airside Project at Logan Airport, the expansion of the regional airports, and the implementation of high speed rail are all necessary for meeting the short-term and long-term inter-city travel needs of the New England region. These regional recommendations are in various stages of implementation. Chapter 2 of the Supplemental DEIS/FEIR discusses the entire region's air transportation system, along with a discussion of alternative modes, specifically high-speed rail, and describes the regional study and its major conclusions.

RE: EOEA # 10458 - COMMENTS ON DRAFT EIR/EIS - AIRSIDE IMPROVEMENTS PROJECT, LOGAN AIRPORT

Dear Secretary Durand::

This letter serves to transmit additional comments from the City of Somerville on the above referenced project. Enclosed, please find the City's comments previously submitted for your records.

The City is already on record regarding certain components of the Airside Improvements Project, in particular the construction of Runway 14/32. Here, I'd rather raise some general issues which focus more on the completeness and adequacy of the draft EIR/EIS.

Our overall impression is that Logan is developing Runway 14/32 because it hopes to put a major dent in the low-fare airline wars. Repeatedly throughout the document, it is clear that Massport is not cooperating with the other regional airports - it is competing for their business. **Competition is the key ingredient driving Logan's expansion.** This fact is bolstered by Massport's own use of the term "leakage" in the document. For us, that explains Massport's emphasis on expansion of this facility. It is assumed to be the path of least resistance and expense. The facility is also

58.1

one that is under Massport's control.

The EIR/S is instructive. It illustrates well that other airports are absorbing some market share, and reducing the need for passengers to fly to Logan in order to connect to other markets. The other airports have been successful in luring low-fare carriers - possibly more so than Logan? I'm assuming that this is a market Massport feels it must grow at Logan, or it will continue to see its role in the marketplace decline.

I especially found it interesting that Section 2 continuously discusses "recapture" of passengers. Massport uses this term as if the passengers were Logan's to begin with. This is erroneous: some of these passengers are new trips, others would have chosen alternative transportation or other airports besides Logan. Massport takes every opportunity to tell the reader how important Logan is. Remember, there are new employers and residents in Rhode Island (for example) who did not consider Logan as an alternative - T.F. Green is at their back door.

The details on air/rail ridership changes projected when the Northeast Corridor project is completed are encouraging. It should be noted that Massport has been reluctant to recognize the Northeast Corridor rail project in the past; in fact, the previous Secretary of Environmental Affairs cited that as a deficiency of the annual GEIR two years ago.

Repeatedly, Massport makes determinations about people's mode choice on the basis of travel time and mileage. Discuss the Portland-Boston route, for example. There aren't many choices except for autos at this time. If workable alternatives are developed and promoted, the public will use them.

Massport makes some very true statements about its agency's role in shaping transportation policy. However, it should be noted that agencies above and around Massport have a great deal to do with shaping transportation policy which is favorable to Massport's objectives. The FAA is a clear champion of the airline industry, and has clout. Perhaps FAA cannot "dictate which airports an airline may serve, the schedules or fares a carrier charges", but it can exercise control over airport design, capacity and operation which have a lot to do with an airline's decision to provide service at a given facility, or to pursue a regional policy which decides the role a particular airport will play in a region.

The noise analysis referred to states that the 5,000 foot runway better met Massport's overall objectives, particularly in the area of noise reductions to impacted sensitive receptors. However, Section 3-10 does not go into great detail concerning the performance of each alternative. I'd like to see the "clear benefits" substantiated. Assumed, this means that a larger runway can accomodate more aircraft types, thus removing those aircraft from the other runways which fly over greater numbers of sensitive receptors. 58.2

With respect to the centerfield taxiway - I don't have any disagreements with what is stated, but it

is important to point out that this improvement will also increase airport traffic capacity - and, taxiway delays/apron congestion will be relieved for a temporary period. And, with more queue space available, noise and air pollution impacts to adjacent communities will also increase. 58.3

The statement is made that "delay statistics for Logan Airport confirm that it is unable to accommodate existing demand levels without incurring unacceptable levels of delay". Unacceptable to whom? FAA, passengers, Massport? It goes right back to proposing projects which will reduce delay effectively, for a reasonable time period - otherwise, it is dishonest to propose this improvement as a worthwhile delay reduction measure, especially without noting that delays will resume previous levels if an airport-wide growth and expansion plan is to be pursued. **The problem is not adequately defined. In fact, the problem appears to be misrepresented.** 58.4

Regarding ambient sound levels. It is true that nighttime aircraft operations are more noticeable and annoying because the ambient sound level is lower. In surrounding, less urbanized communities, the sound is even more noticeable. This problem will increase with additional flight activity, and may be tempered somewhat by aircraft improvements. 58.5

Passenger Facility Charges (PFC's) - although Massport received approval to assess this fee on each passenger in 1993, is the fee being collected? It was unclear from reading the document. 58.6

It's noted that elevated terrain has an affect on sound propagation - particularly in East Boston. This has been raised in other communities, including Somerville. 58.7

In Summary, the EIS/R fails to address the following:

Project cost to the environment and to human health. Where is the risk analysis, particularly for the anticipated noise exposure and air pollution which will result from this project? Particularly, we believe that the increased activity at Logan Airport will propagate additional traffic - in already congested areas. We have always believed that creating and/or expanding other facilities in the region would cut down trip miles to/from the airport, and would aid overall environmental quality. This is particularly important when the EIR/EIS states that over 50% of Logan passengers originate in the Route 128 and 495 highway regions. Regional employers will appreciate this, too. 58.8 58.9

Project cost to property owners. Increased traffic at this location will impact all classes of property owners in the area, particularly those which are sensitive receptors. 58.10

Inadequacy of noise standards. Reliance on an average Day-Night Sound Level (DNL) contour inadequately characterizes true noise impacts associated with the Project. Other reviewers have stated that the use of this average downplays the actual noise levels experienced by sensitive receptors - it is the individual (higher) noise emissions which more negatively impact surrounding residential receptors - not the average level. HUD and FAA definitions are at fault here. We ask 58.11

that MEPA address this issue.

Connection to Landside Improvements. The focus of this Draft EIS/EIR is on the Airside Improvements. The City, after reading the documents, does not believe that improvements to gates, terminals and other landside facilities have been properly presented within the context of this document. That is a serious flaw, because the landside and airside facilities are interdependent and **should not be separated** insofar as both contribute to the state of overall airport operations and the true operational objectives for this facility. The City believes that if this is done, the problem definition will change significantly. 58.12

For the above reasons, we respectfully request that the Draft EIR/EIS be withdrawn. We also recommend that a regional approach be taken to dealing with what is a regional issue. My administration is willing to participate in such an effort.

Thank you.

Sincerely,

William Roche

RE: PROPOSED AIRSIDE IMPROVEMENTS, LOGAN AIRPORT

Dear Mr. Blute:

This letter is in response to the presentations made by Massport concerning the future of Logan Airport. It is also to comment on the draft Environmental Impact Report/Statement for the proposed Airside Improvements Project for Logan Airport.

The analyses which have been done (and the recent Massport presentation) all support the fact that Logan Airport will continue to grow - in size as well as activity. This presents long-term planning and environmental issues for the communities that live, on a daily basis, with the environmental consequences of Logan's present operations.

I believe that most, if not all parties involved in this issue, appreciate the fact that Logan Airport is important to the region's economic health. However, its role in serving the region's air transportation needs must be balanced regionally if the surrounding environment is to remain habitable.

Somerville is on record as supporting equitable development and distribution of regional air travel and air operations. The information we've been given concerning growth rates at other New England airports looks positive when presented as percentages of growth; however, the numbers

from which these are derived (which are more important) definitely indicate that a great deal of undeveloped capacity exists at other regional airports. The percentages are misleading to the public. Thus, we support the Citizens' Advisory Committee positions - namely to look for regional solutions to the capacity problem, procurement of funds to make other facilities competitive, such as at Hanscom Field and at Worcester. 58.13

We have been told that the airline industry does not prefer to develop facilities at several airports in a given market. I would believe that any airline would prefer to do business at facilities where their customer base may enjoy better access, less flight delay and more modern facilities. **Focus development efforts on a new facility away from downtown - where many of the travelers originate.**

Any airport project which ultimately increases operational capacity, particularly for air traffic which will impact nearby communities, is of serious concern. In fact, with or without construction of Runway 14/32, Massport will continue to promote a policy of development and continued growth at Logan. This growth will attract new air traffic - and the delays which have been one of Logan's most often cited problems will remain. The reclaimed capacity on the larger runways will simply be devoted to future air traffic growth which Massport has admitted it is planning for. 58.14

With regard to review of the draft EIR/S, it has come to my attention that the document is being revised continuously as Massport is receiving input at public meetings. Therefore, reviewers of this document, including members of the Citizens Advisory Committee, are working with an outdated version. It is customary once a draft environmental document is released to include comments and to incorporate responses to those comments after the public review period is closed. This continuous process deprives reviewers of a fair and meaningful review, and should be rejected on principle.

I see no need to debate the finer points of numerous technical documents further. Therefore, I ask to be put on record as opposed to the continued expansion of Logan Airport, particularly at present against the proposed expansion of Runway 14/32. Thank you.

Sincerely,

William Roche

Letter 58
City of Somerville
William Roache, Acting Mayor

Code	Topic 1	Topic 2	Comment	Response
58.1	Regional Transportation	Regional Airports	... it is clear that Massport is not cooperating with the other regional airports. ... it is competing for their business. Competition is the key ingredient driving Logan's expansion.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport.
58.2	Noise	Model	The noise analysis referred to states that the 5,000 foot runway better met Massport's overall objectives, particularly in the area of noise reductions to impacted sensitive receptors. However, Section 3-10 does not go into great detail concerning the performance of each alternative. I'd like to see the "clear benefits" substantiated. Assumed, this means that a larger runway can accommodate more aircraft types, thus removing those aircraft from the other runways which fly over greater numbers of sensitive receptors.	In addition to providing more delay reduction, the 5,000 foot runway also reduces the number of people exposed to a DNL of 70 dB or greater. Refer to Section 3.2.1 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
58.3	Alternatives	Taxiway Improvements	...[T]he centerfield taxiway...will also increase airport traffic capacity - and, taxiway delays/ apron congestion will be relieved for a temporary period. And, with more queue space available, noise and air pollution impacts to adjacent communities will also increase.	The Centerfield Taxiway will not increase the number of ground operations at Logan Airport. It will simply increase controller flexibility and reduce delays. The number of aircraft on the taxiway system is directly related to the number of flights operating at Logan Airport and will not change because there is another taxiway. Neither the airlines nor the FAA desire to have extra aircraft idling on the taxiway system, as this would cause unnecessary costs to the airlines, unnecessary environmental impacts, and increased taxiway congestion which would inhibit the ability of controllers to move aircraft to and from the runways. The Centerfield Taxiway will not change the taxiway demand, and by reducing taxiway congestion will reduce the environmental impacts on the surrounding communities
58.4	Purpose And Need	Delay	The statement is made that "delay statistics for Logan Airport confirm that it is unable to accommodate existing demand levels without incurring unacceptable levels of delay". ...[D]elays will resume previous levels if an airport-wide growth and expansion plan is to be pursued. The problem is not adequately defined. In fact, the problem appears to be misrepresented.	The goals of the Airside Project are to reduce delay, increase airport efficiency and improve airfield safety in an environmentally responsible manner. They do not reflect an "airport-wide growth and expansion plan", nor increase the capacity of the airport. Future passenger and operations levels can be accommodated by Logan Airport without any airside improvements but not without delays and resulting adverse environmental impacts. Long-term aviation growth is a recognized worldwide condition that is beyond Massport's control, which means that the sooner the airfield efficiencies are implemented, the more benefits they will accrue over the future. Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts.
58.5	Noise	Impacts	... It is true that nighttime aircraft operations are more noticeable and annoying because the ambient sound level is lower. In surrounding, less urbanized communities, the sound is even more noticeable. This problem will increase with additional flight activity, and may be tempered somewhat by aircraft improvements.	Check that this is till valid. Table 6.2-17 of the Supplemental DEIS/FEIR shows nighttime jet operations projected to increase from 144 in 1998, to as many as 231 under the No Action Alternative with the 2015 High Regional Jet Fleet. However, regardless of the fleet, many of the future night operations are the result of delays that will occur as demand at Logan Airport continues to increase. One of the direct benefits of the Preferred Alternative is that it will reduce these night operations by 32 to 43 flights depending on the fleet forecast, though *any* alternative to the No-Action scenario will help alleviate some of the projected delays. In addition, Massport is committed to exploring other measures to reduce nighttime noise whether or not the Preferred Alternative is implemented.

Code	Topic 1	Topic 2	Comment	Response
58.6	Purpose and Need	Economic Impacts	Passenger Facility Charges (PFCs) - although Massport received approval to assess this fee on each passenger in 1993, is the fee being collected? It was unclear from reading the document.	Yes. Maspsort is collecting PFCs from enplaning passengers at Logan, as authorized by the FAA. PFCs are being used to fund a number of projects at Logan including: the International Gateway Project; Terminal E Modernization; improvements to circulating roadways; construction of elevated pedestrian walkways; residential sound insulation; and the Terminal A Master Plan.
58.7	Noise	Model	It's noted that elevated terrain has an affect on sound propagation - particularly in East Boston. This has been raised in other communities, including Somerville.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update).* In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure. Using results from a special study of Terrain Modeling analysis ("hill effects") in Orient Heights and Jeffries Point, Massport applied for and received approval to apply a correction to 1999 contours to account for increased levels in Orient Heights.
58.8	Public Health	Effects	...[the EIS/R fails to address] Proiect cost to the environment and to human health. Where is the risk analysis, particularly for the anticipated noise exposure and air pollution which will result from this project?	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport, nor did it identify hearing loss as a public health concern.

Code	Topic 1	Topic 2	Comment	Response
58.9	Ground Transportation	Access To Logan	...we believe that the increased activity at Logan Airport will propagate additional traffic - in already congested areas. We have always believed that creating and/or expanding other facilities in the region would cut down trip miles to/from the airport, and would aid overall environmental quality.	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates). Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
58.10	Ground Transportation	Access To Logan	[The EIS/R fails to address] Project cost to property owners, Increased traffic at this location will impact all classes of property owners in the area, particularly those which are sensitive receptors.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives.
58.11	Noise	Model	Reliance on an average Day-Night Sound Level (DNL) contour inadequately characterizes true noise impacts associated with the Project. Other reviewers have stated that the use of this average downplays the actual noise levels experienced by sensitive receptors - it is the individual (higher) noise emissions which more negatively impact surrounding residential receptors - not the average level.	For environmental sounds of all types, the EPA adopted the Day-Night Sound Level (DNL) to account for both the magnitudes and duration of the various sounds. The DNL penalizes sounds made during the nighttime (chosen in the United States to be 10 PM to 7 AM) by adding 10 dB to the measured values. It is unfortunate that it is often characterized as the "average level" and therefore some people believe that it does not represent the levels of individual events. Actually, it represents the total noise exposure in a 24-hour day, including a nighttime penalty of 10 dB. Thus, it accounts for all the individual sound events during the 24-hour period. EPA's review of the available case studies on the effects of environmental noise on humans found that DNL correlates better with the effects than any measure of the various individual events.

Code	Topic 1	Topic 2	Comment	Response
58.12	Environmental Review Process	MEPA	[The EIS/EIR fails to address] Landside Improvements. The focus of this Draft EIS/EIR is on the Airside Improvements. The City, after reading the documents, does not believe that improvements to gates, terminals and other landside facilities have been properly presented within the context of this document. That is a serious flaw, because the landside and airside facilities are interdependent and should not be separated insofar as both contribute to the state of overall airport operations and the true operational objectives for this facility. The City believes that if this is done, the problem definition will change significantly.	The proposed improvements analyzed in the Supplemental DEIS/FEIR involve both construction and administrative actions that will facilitate aircraft operations (landings, takeoffs and taxiing). None of the improvements involve landside facility improvements (*e.g.*, terminals and roadways) or related operations. The Supplemental DEIS/FEIR analyzes in detail the impacts from aircraft operations, including analysis of noise and air quality impacts during the years 1993, 1998 and under future forecast scenarios as well as environmental benefits from certain of the improvement concepts under review. In this respect, the Supplemental DEIS/FEIR conforms with scoping directives from the lead federal agency (the FAA) and with applicable FAA environmental orders, all issued in accordance with NEPA, and with directives from EOEA issued under MEPA. The various GEIR documents, including the *Logan Airport 1998 Annual Update* and the *1999 Environmental Status and Progress Report* (previously GEIR), provide additional analytic context by examining cumulative impacts from airside (*i.e.*, aircraft) operations and landside (*e.g.*, vehicular traffic, terminal service vehicles) operations at Logan Airport as well as Massport's comprehensive mitigation program. The ESPR/GEIR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR as a background document. Each GEIR/ESPR submission is subject to public review and comment. The *Logan Airport 1998 Annual Update* and the *1999 ESPR* analysis is based on the same forecast levels used in the Supplemental DEIS/FEIR. The GEIR/ESPR informs Massport's planning process for all the improvements at Logan Airport, including the improvements under review in the Supplemental DEIS/FEIR. Consistent with past practice, Massport expects that the FAA will take the GEIR/ESPR analysis into account during its deliberations and ultimate decision on the Supplemental DEIS/FEIR.
58.13	Regional Transportation	Regional Airports	... we support the Citizens' Advisory Committee positions - namely to look for regional solutions to the capacity problem, procurement of funds to make other facilities competitive, such as at Hanscom Field and at Worcester. Focus development efforts on a new facility away from downtown – where many of the travelers originate.	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Airside Project Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
58.14	Purpose And Need	Delays	...with or without construction of Runway 14/32, Massport will continue to promote a policy of development and continued growth at Logan. This growth will attract new air traffic - and the delays which have been one of Logan's most often cited problems will remain. The reclaimed capacity on the larger runways will simply be devoted to future air traffic growth which Massport has admitted it is planning for.	Neither Massport nor the FAA has a program to increase passenger demand at Logan Airport. Rather, the objective of both organizations is to accommodate demand safely and efficiently. The recommended Airside Project is intended to enable Logan Airport to accommodate current and future aircraft activity with minimum delay. The construction of Runway 14/32 would significantly reduce delays associated with northwest wind conditions, but would not be expected to induce additional aircraft traffic or passenger activity at Logan Airport.

CITY OF SOMERVILLE, MASSACHUSETTS
BOARD OF ALDERMEN

LETTER 59 April 22, 1999

WILLIAM A. WHITE, JR.
ALDERMAN AT LARGE

Delivered by hand
Mr. Arthur Pugsley
MEPA Unit
Executive Office of Environmental Affairs
100 Cambridge Street, 20th floor
Boston, MA 02202

Dear Mr. Pugsley:

The following are my comments to the Draft Environmental Impact Statement for Logan Airside Improvements Planning Project dated February 1999 ("DEIS"). This response first provides an overview of the current impact of air traffic from Logan Airport on the City of Somerville (the "City"). Next, it details the defects in the noise analysis of the DEIS, paying particular attention to the absolute failure of Massport to analyze current noise impacts on the City by any realistic measures. It then addresses the defects in the DEIS' analysis of the future noise impacts on the City that would result from the construction of the additional runway.

I. OVERVIEW

The City is the most densely populated community in the Commonwealth of Massachusetts with a population of about 80,000. The City stands directly in the path of planes departing from Runway 33 L. (5-30 of DEIS) This runway directs flights over the City when the FAA utilizes the one runway configuration during strong Northwest winds and when the FAA utilizes the two runway configuration during moderate northwesterly winds. (1-19, 1-20 of DEIS) This configuration also is used during weekends, especially mornings beginning at 6:15 a.m., in what Massport illogically describes as the "equitable adjustment of the burdens of air traffic." The City also has a number of hills directly under the flights from Logan

Airport. While northwesterly winds prevail, the City suffers from constant air traffic, especially during the late evenings until well after midnight followed by early mornings beginning at 6:15 a.m. Massport recognizes that these winds prevail during 37% of the year. (DEIS figure 1.5-7) Because the FAA also uses this configuration during the weekends, affected City residents are unable to receive any respite from this traffic frequently during the fall, winter and spring months.

The topography of the City is such that a number of hills are directly under flights from Logan. Although the City begins about 3 miles from the end of runway 33 L, these elevated areas in the City receive substantial noise impact similar to other areas located much closer to Logan. For example, as a resident of Winter Hill, during the winter I have observed aircraft flying so close to dwellings that noise vibration caused snow to fall off of pitched roofs.

Over the recent past, I and other Aldermen have consistently received numerous phone calls from constituents who have suffered from air traffic noise over the City, including distraught parents of young children who are unable to get 8 hours of sleep. My Winter Hill venue has allowed me personally to experience the impact of air traffic, especially the effects of constant dwell in the evenings and following mornings, that creates a situation where numerous residents are unable to receive a decent night's sleep over extended periods of time. This lost sleep cannot be made up during the weekends because the FAA intentionally directs air traffic over the City on weekends beginning at 6:15 a.m. These concerns have been relayed to Massport's noise complaint telephone line. Massport offers no remediation program for the City and actually downplays the noise impact both in statements to the media and in the DEIS.

Because of growing complaints by residents over noise, the Board of Aldermen last summer invited representatives of Massport to appear before the Board of Aldermen. When asked if Massport had any monitoring devices within the City or had sent anyone to personally observe the noise level, especially over the hilly areas with dense populations, Massport responded negatively. Massport further stated that it would not provide any noise monitors in the City of Somerville. Instead, Massport relies on computer modeling to measure noise in the City. There is no evidence, however, to demonstrate whether Massport's computer modeling accurately reflects the noise born by residents where there are hilly configurations. Clearly, Massport's cavalier attitude toward the City should be

fatal to the DEIS since it shows that Massport has no objective data to demonstrate the real impact of noise on the City's many residents.

II. THE DEIS FAILS TO PROVIDE ANY OBJECTIVE DATE ON CURRENT NOISE OVER THE CITY

Although the heart of the flight tracks from 33L is over the City and is located less than four miles from the end of Runway 33-L, (5-30), Massport locates no noise monitoring equipment within the City or within any reasonable distance from the City. (5-13) Interestingly, many of the noise monitors located to the south of Logan are at greater distances from runways than impacted areas of Somerville. (Id.) Moreover, although many more departures from 33L fly over the City than Everett (see 5-30), Massport does not even consider Somerville to be an area for evaluation (5-19). Despite this lack of objective data over current noise conditions in Somerville, Massport argues that the proposed expansion will "more equitably adjust air traffic" by tripling the volume over the City of Somerville. 59.1

To support its claims relating to noise impact, Massport uses a noise measure which bears no reasonable relationship to the actual noise experienced by people nor the effects of this noise on people. The Day-Night Sound Level (DNL) used by Massport is "a weighted sound level of a steady-state noise during a 24-hour day which contains the same sound exposure as does the summation of the sound exposures from all of the individual events that occur during a 24-hour period, with the provision that noises occurring at night are increased by 10dB." Without doubt, those areas with a high DNL suffer from excessive noise. But because it is a 24 hour average, the DNL understates the actual impact of noise on many affected communities such as Somerville. 59.2

For example, Somerville suffers from severe air traffic on many evenings between the hours of 10:30 p.m. through 12:30 a.m. and the following mornings between 6:15 a.m. through 8:00 a.m. with little traffic for the rest of the day. Needless to say, the affected residents suffer from sleep deprivation with physical impacts the next day. Another community could experience constant air traffic from 10:00 a.m. through 6:00 p.m. A reasonable person might conclude that the first community bore the more severe consequences of air traffic since the noise

would come at night and the early morning against a quieter background when most people are at home and trying to sleep. In the second community, most people would be at work, out of the house, or doing activities which do not require quiet (unlike sleep) Under DNL as used by Massport, however, the first community would not appear to suffer any adverse consequences. Likewise, under Massport's definitions of dwell and persistence, the first community would not even qualify for relief. (See 5-18, 5-19 for Massport's definitions).

To an elected official in an affected community, it is beyond belief that the DEIS does not measure and discuss the amount of noise that communities may experience when there is late evening flight traffic followed by early morning flight traffic. In such situations, affected residents cannot realize a decent night' sleep. Perhaps this oversight is understandable, since such a study would show many thousands of people in the Greater Boston Area are subject to severe sleep deprivation many times during the year as a result of air traffic from Logan Airport.

A more reasonable method to determine the impact of noise upon a community should take the noise level, time of day and population density into account. If a dense community is subjected to noise which would awaken an average person during the late evenings and early mornings, large numbers of people may have their sleep affected for extended periods of time. Most people would agree that such an area would be suffering from severe environmental consequences. In the DEIS, however, Massport has not undertaken such an analysis. A realistic figure should be developed to measure the "cost" of noise, measuring the number of people affected by noise, the level of noise, and the consequences of noise (such as hours of lost sleep, inability to enjoy one's home, etc.). Such a measure should then be contrasted with the economic costs which the DEIS claims result from delays. 59.3

Since Massport has no noise monitoring devices in Somerville, it is impossible for anyone to obtain actual hard data for noise levels, especially in hilly areas, during the late evening and early morning hours to arrive at such a measure on their own. In an effort to obtain some hard data, I used a Radio Shack Sound Level Meter to take measurements at Winter Hill. Depending on the altitude of planes, I measured up to 110 dB out doors and 75dB indoors with windows closed during late night and early morning hours. This hard data confirms my personal

experience and the experience of constituents suffering from this air traffic. For example, I have been awoken on numerous mornings by flights departing at 6:00 a.m. after suffering from persistent flights that occurred from after 11:00 through midnight (and even 1:00 a.m.) the prior evening. In fact, on Sunday, April 10, 1999 three flights traveled over Winter Hill from approximately 1:00 a.m. through 1:15 a.m.. The following morning, flights started at 6:15 a.m., which awoke me. The last four Sundays in a row air traffic has begun at 6:15 a.m. During the past week, I was awoken twice after 3:00 a.m. and received complaints from constituents who were also awoken. I have personally contacted the noise complaint telephone line on a number of these occasions, even Thanksgiving and Christmas morning at 6:30 a.m. Of course, Massport takes the information but provides no relief. (Copies of some notices are attached hereto as Exhibit A). Given my personal experience with noise and the experiences of my constituents, I can affirmatively state that the DEIS is totally defective in its analysis with respect to the current noise impacts on the City and elsewhere.

III. THE DEIS FAILS TO ADEQUATELY ADDRESS THE NOISE CONSEQUENCES TO THE CITY IF THE PROPOSED RUNWAY IS BUILT

Since the DEIS fails to objectively measure the current noise impacts on the City, it is impossible to reasonably evaluate the impact of the proposed expansion on the City. As discussed above, Massport relies on its general discussions of decibel levels over areas, but does not provide a realistic evaluation of the impact of the additional noise on real people in the City. Interestingly, although departures from 33L are expected to triple, and the heart of this flight pattern is over the City, (6-13), Massport does not specifically address the impact on the City from this tripling in air traffic. Instead, Massport provides charts showing increases in dwell exceedence and persistence exceedence for the various runways. (Figures 6.2-5 through 6.2-8). 59.4

These charts demonstrate that dramatic increases in dwell and persistence over the City will result from departures from 33L if the runway is constructed. There is, however, no description of the impact of the new runway on heavy late night overflights followed by heavy early morning overflights. The discussion in Part II above showed that Massport and the DEIS does not measure or address the level of late night overflights followed by heavy early morning overflights on the

City. My own experience, however, demonstrates that such level is substantial during much of the year. Since 33 L is the only runway that can be used when there are severe northwest winds, if the runway is built, the City will continue to suffer from such late night overflights followed by early morning overflights when such winds predominate. But, the City will then also suffer from excessive dwell and persistence during the rest of the day resulting from the use of the new runway. A fair reading of the DEIS, however, shows that these clear noise environmental impacts to the City are not adequately addressed.

Not only is there a clear danger of severe noise environmental impacts on the City, but the remedial measures proposed by Massport are ineffective. For a community like Somerville which suffers from substantial late night followed by early morning overflights, Massport offers no soundproofing. The only remedial measure discussed in the DEIS is the projected increase in the use of Stage 3 aircraft. (6-9). However, use of stage 3 aircraft is already required during the late night and early mornings. But it is the noise from these stage 3 aircraft that currently awakens people in the City after 11:00 p.m. and after 6:00 a.m. And without actual hard data from noise measurements in places such as Winter Hill in the City, there can be no objective analysis of the noise experienced by people when these stage 3 jets are used. Unfortunately, it appears that the proposed remediation requiring the use of stage 3 jets would be nothing more than an empty palliative for the residents of the City. 59.5 59.6

IV. SUMMARY

In summary, the DEIS utterly fails to address the current impact of noise from Logan on the City, despite the fact that the City is the densest community in the Commonwealth. Likewise, the DEIS fails to address the current level of late evening followed by early morning overflights, despite the fact that this type of air traffic results in substantial sleep deprivation over extended periods of time.

Lastly, the DEIS fails to address the future noise impact of the proposed runway on the City. As a result, the Secretary of Environmental Affairs should insure that the Final EIR measures and discusses these present and future noise impacts on the City as set forth herein

Very truly yours,

Dear Mr. Pugsley:

Today I filed with your office a letter setting forth my comments to the Draft Environmental Impact Statement on the proposed expansion of Logan Airport. I inadvertently failed to attach Exhibit A to those comments. As a result, I am faxing you a copy of Exhibit A and ask that you attach it to my letter to you. Thank you for your cooperation.

Very truly yours,

Conditions:

Wind Direction: 320 deg
Wind Speed: 13 Knots
Ceiling: 15000 Ft
Visibility: 10.0 Miles

Runways in Use:

Arrivals: 33L - 33R
Departures: 33L

Complaint Description: An aircraft flew over at 3:30 am. Please identify the stage. Who authorized the flight? Why not over the water?

Massport Report of Investigation: You were affected by an LR35 departure from Runway 33L. The aircraft was Stage 3 and used Runway 33L with the strong northwesterly winds. The FAA has been notified of your observations and concerns by copy of this complaint.

Letter 59
City of Somerville, Board of Alderman William A White Jr., Chairman, Committee on Housing and Community Development

Code	Topic 1	Topic 2	Comment	Response
59.1	Noise	Monitoring	Although the heart of the flight tracks from 33L is over the City and is located less than four miles from the end of Runway 33-L, (5-30), Massport locates no noise monitoring equipment within the City or within any reasonable distance from the City.	Requests for new noise monitors should be addressed to Massport.
59.2	Noise	Model	The Day-Night Sound Level (DNL) used by Massport is "a weighted sound level of a steady-state noise during a 24-hour day which contains the same sound exposure as does the summation of the sound exposures from all of the individual events that occur during a 24-hour period, with the provision that noises occurring at night are increased by 10dB." Without doubt, those areas with a high DNL suffer from excessive noise. But because it is a 24 hour average, the DNL understates the actual impact of noise on many affected communities such as Somerville.	For environmental sounds of all types, the EPA adopted the Day-Night Sound Level (DNL) to account for both the magnitudes and duration of the various sounds. The DNL penalizes sounds made during the nighttime (chosen in the United States to be 10 PM to 7 AM) by adding ten dB to the measured values. It is unfortunate that it is often characterized as the "average level" and therefore some people believe that it does not represent the levels of individual events. Actually, it represents the total noise exposure in a 24-hour day, including a nighttime penalty of ten dB. Thus, it accounts for all the individual sound events during the 24-hour period. EPA's review of the available case studies on the effects of environmental noise on humans found that DNL correlates better with the effects than any measure of the various individual events.
59.3	Noise	Impacts	A realistic figure should be developed to measure the "cost" of noise, measuring the number of people affected by noise, the level of noise, and the consequences of noise (such as hours of lost sleep, inability to enjoy one's home, etc.). Such a measure should then be contrasted with the economic costs which the DEIS claims result from delays.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.
59.4	Alternatives	Runway 14/32	...although departures from [Runway] 33L are expected to triple, and the heart of this flight pattern is over the City, ([Page] 6-13), Massport does not specifically address the impact on the City from this tripling in air traffic. Instead, Massport provides charts showing increases in dwell exceedence and persistence exceedence for the various runways. (Figures 6.2-5 through 6.2-8). These charts demonstrate that dramatic increases in dwell and persistence over the City will result from departures from 33L if the runway is constructed. There is, however, no description of the impact of the new runway on heavy late night overflights followed by heavy early morning overflights.	There are five jet departure tracks from Runway 33L. Of these, two tracks turn over Somerville (refer to Figure 6.2.3 of the Supplemental DEIS/FEIR). These two tracks carry less than 30 percent of the departures from Runway 33L. The increase in effective jet departures from Runway 33 over Somerville is from about 3.3 percent to 3.6 percent in the 29M Low Fleet scenario and from 2.7 percent to 3.2 percent in the 37.5M Low Fleet scenario (refer to Table 6.2-2 of the Supplemental DEIS/FEIR). This increase of about ten percent would not dramatically increase either dwell or persistence. The increases attributed to "Arr 15/Dep 33" in Figures 6.2-5 through 6.2-8 of the Supplemental DEIS/FEIR result primarily from increased arrivals on Runway 15 (refer to Table 6.2.2 of the Supplemental DEIS/FEIR). Since these arrivals do not fly over Somerville there will be little increase in noise in Somerville from the proposed changes at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
59.5	Noise	Sound Insulation	Not only is there a clear danger of severe noise environmental impacts on the City, but the remedial measures proposed by Massport are ineffective. For a community like Somerville which suffers from substantial late night followed by early morning overflights, Massport offers no soundproofing.	If the Preferred Alternative is implemented, Somerville's overflights will increase in comparison to the No-Action Alternative. However, the highest resulting noise exposure in that community is estimated to be on the order of 55 dB DNL, well beyond the 60 dB DNL contours shown in Figures 6.2-8 and 6.2-10 through 6.2-14 of the Supplemental DEIS/FEIR.
59.6	Noise	Impacts	The only remedial measure discussed in the DEIS is the projected increase in the use of Stage 3 aircraft. (6-9). However, use of Stage 3 aircraft is already required during the late night and early mornings. But it is the noise from these Stage 3 aircraft that currently awakens people in the City after 11:00 p.m. and after 6:00 a.m.	The average noise of Stage 3 aircraft operating at Logan Airport is expected to decrease with time as the low bypass JT8D powered aircraft, which have been hushkitted to meet Stage 3 requirements, are retired from the fleet and replaced by the quieter new high bypass powered Stage 3 aircraft. The Night Equivalent Sound Level (LeqN) was calculated at 23 selected locations for all fleets and scenarios. Table 6.2.15 of the Supplemental DEIS/FEIR reports these data for the 29M Low and 37.5M High Fleet scenarios of the Supplemental DEIS/FEIR. The results show that, at most locations, the LeqN for the future fleets is lower than for the 1993 case. Where there is an increase in LeqN, the reason was the increase in flights for the No Action Alternative, which generally was mitigated by the Preferred Alternative. These results indicate that there will be less sleep disturbance in the future than that currently experienced. Refer to Section 7.4.1 of the Supplemental DEIS/FEIR for a discussion of cumulative noise impacts. In addition, Massport proposed the following noise mitigation measures: Runway 14/32 would be designed, constructed, and operated to handle over-water operations only (unidirectional). Massport would seek to construct Runway 14/32 to reflect unidirectional use. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR*. For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements. Massport has developed PRAS goals to which the FAA attempts to achieve given weather and safety conditions. Section 4.3 of the Supplemental DEIS/FEIR provides an evaluation of existing measures for monitoring PRAS achievement and demonstrates that the FAA has improved its performance relative to the PRAS goals. The Preferred Alternative mitigation program includes additional reporting requirements recommended to enhance the Massport monitoring effort.

ARTHUR McCUE
CITY CLERK

LETTER 60

Mr. Arthur Pugsley
MEPA Unit
Executive Office of
Environmental Affairs
100 Cambridge St.
Boston, MA 02202

Dear Sir:

Enclosed please find a certified copy of a Resolution unanimously adopted by the Somerville Board of Aldermen at their April 22, 1999 meeting.

Alderman-at-Large William A. White, Jr. the resolution's sponsor, also has requested that a copy of the video tape of the public hearing regarding Logan runway expansion which was held on April 13, 1999 at Somerville City Hall be forwarded to you. Accordingly both documents are included herewith.

If you have any questions, please do not hesitate to contact me.

Very truly yours,

Arthur B. McCue
City Clerk

Board of Aldermen
City of Somerville
Massachusetts

City Hall

April 22, 1999

RESOLUTION

RESOLVED, That this Board of Aldermen hereby adopts the comments of Alderman William A. White Jr. on the Draft Environmental Impact Statement for Logan Airside Improvements Planning Project as set forth in the attached letter from Alderman White to Mr. Arthur Pugsley, dated April 22, 1999; **AND BE IT FURTHER** 60.1

RESOLVED, That this Board requests that a copy of this Resolution be sent to Mr. Pugsley for inclusion in MEPA's record.

A TRUE COPY ATTEST:
Esther B. McCue
CITY CLERK

Submitted By:

President Joseph A. Curtatone

Re: Boston, Logan International Airport
Logan Airside Improvements Project
Draft Environmental Impact Statement/
Environmental Impact Report
EOEA No. 10458

Gentlemen:

This letter provides the comments of Board of Selectmen of the Town of Winthrop, Massachusetts ("Selectmen") on the Draft Environmental Impact Statement/Report ("DEIS/R") for the above-referenced project ("Project") under the Massachusetts Environmental Policy Act ("MEPA"), the National Environmental Policy Act of 1969 ("NEPA") . It also provides the comments of the Selectmen under Section 4(f) of the Department of Transportation Act of 1966 ("4f"). Finally, it provides the comments of the Selectmen on the Notice of Project Change for the Project, submitted by the Massachusetts Port Authority ("Massport") on February 19, 1999.

The Selectmen find the DEIS/R wholly inadequate under both NEPA and MEPA. The

Selectmen urge the United States Environmental Protection Agency ("EPA") to give the DEIS/R a ranking of "Environmentally Unsatisfactory" and "Inadequate." The reasons for these findings by the Selectmen are as follows:

A. The DEIS/R completely ignores the "induced demand" issue highlighted by the EPA in its comments on the Environmental Notification Form/Scope of Work ("ENF") and required to be studied and included in the DEIS under the regulations of the Council on Environmental Quality. The Project clearly increases capacity and fosters the growth of both passenger volume and aircraft operations at Logan. Yet, the DEIS/R pretends that the Project is somehow "demand neutral." 61.1

B. As a result, virtually all of the environmental impact analyses for the Project are inaccurate because they are based on the same passenger levels for both the preferred alternative and the no-build alternative. This means that the DEIS/R significantly understates both the environmental impacts of the Project and the potential for passenger diversion of various alternatives. 61.2

C. Whole categories of impacts on Winthrop, such as land use patterns, historical and cultural resources and wetlands are ignored. 61.3

D. Several reasonable alternatives have not been included or analyzed in any meaningful way. 61.4

E. The DEIS/R ignores major impacts on 4f resources. 61.5

F. It also ignores public health issues. 61.6

G. The DEIS/R fails to meet the requirements of both MEPA and NEPA with respect to mitigation. 61.7

1. The Basic Flaw: This Project Increases Capacity and Induces Growth Rather Than Just Reducing Delays

A. Induced Demand

The stated purpose of the Project is to reduce delays at Logan. Even assuming for the sake of argument that the Project would address that problem, it is quite clear that the very existence of the Project will also induce passenger demand. The EPA stated this issue quite succinctly in its November 8, 1995 comments on the ENF for the Project:

> EPA is concerned that airside and landside improvements will attract more passengers to the airport ("induced demand"), as opposed to merely

accommodating the already anticipated passengers.

The Regional Administrator, John DeVillars, echoed this theme in his November 13, 1995 comment on the ENF:

> ...the expected increase in passenger volume that will be accommodated by these projects will affect regional and local transportation patterns and consequently, air quality.

EPA did not raise these concerns in a regulatory vacuum. The regulations of the Council on Environmental Quality ("CEQ") for implementing NEPA require an EIS to analyze both direct and indirect effects. An "indirect effect" is defined by CEQ to include:

> ...growth inducing effects and other effects related to induced changes in the...growth rate, and related effects on air and water and other natural systems, including ecosystems.

40 CFR Section 1508.8 (b). Thus, it is hardly surprising that EPA was so concerned about "induced demand" in 1995. The NEPA regulations require the DEIS/R to deal with the issue.

The project proponents, Massport and the FAA, inexplicably try to pretend that this requirement does not exist. They cling to the notion that the same number of passengers will fly in and out of Logan whether or not the airside "improvements" are built, claiming that "[n]either the runway nor any other improvements associated with the... Project will induce demand by new passengers who would not otherwise come to Logan." This "demand neutral" approach flies in the face of common experience and common sense. It is well established that major regional transportation initiatives such as highways or runways induce demand. Indeed, the Boston business community and Massport have been promoting the Project in the press with the claim that Boston will lose conventions, tourists, jobs and business meetings if the Project is not built. If, for the sake of argument, one accepts theses claims by Project backers, then it is quite clear that the Project will induce tourists, conventioneers and business people to come to Boston, using Logan to do so.

61.8

Conversely, if the Project is not built, these same passengers will (according to the business community and Massport) avoid Boston at all costs. Thus, the no-build alternative clearly has a "negative inducement" factor. For example, the DEIS/R claims that if the Project is not built, the average delay at Logan for each takeoff and landing may well reach almost an hour. If that is the case, then the time differential between flying and taking the alternative of high speed rail between Boston and New York is virtually eliminated. Clearly, the effect of such a leveling of the transportation playing field will be to induce more Boston-New York passengers to take the train instead of the shuttle. However, the DEIS/R completely ignores this effect.. It pretends that air travel will still have a more than one hour time advantage over high speed rail (Table 2.4-5). Are Massport and the FAA seriously arguing that average delays of one hour per

flight will have no effect on Logan's passenger and operations levels? Put another way, there is little or no chance that Logan's passenger level would ever approach 45 million under the no-build scenario with average delays of almost an hour per operation.

The DEIS/R also fails to look at induced demand issue with regard to the cumulative effects of the combination of Logan 2000 landside program and the airside Project. Massport and FAA employed the same demand neutral argument with respect to the billion dollar Logan 2000 landside project.. Now Massport and FAA claim that putting a billion dollars into improving ground access, parking and terminal space at Logan (Logan 2000), contributing $300 million to a new harbor tunnel and related highways designed to improve interstate highway access to Logan (Third Harbor Tunnel and Route 1A), and finally creating a new runway and various airside improvements (the Project), all at the same time and in the same location will have absolutely no effect on passenger demand at the airport.

It is time for Massport and the FAA to abandon that "theory." The Secretary's decision on the ENF clearly stated that the DEIS/R "should include analysis of cumulative impacts, and should clearly explain the relationship between the Logan 2000 landside program and the Airside Improvements." The EPA went further. The Regional Administrator stated that the DEIS/R would "provide the critical opportunity" (emphasis in original) to examine the synergistic or cumulative effects of Logan 2000 and the Project. The EPA comments on the ENF described the FAA's environmental review for Logan projects as "segmented." EPA was very clear in its recommendation that the DEIS needed to evaluate the possibility "that more people will drive to the airport if there is a new garage, and that more passengers will choose to fly from Logan...if Logan's capacity is increased as a result of airside improvements such as a new runway." EPA questioned the Massport and FAA position that none of the landside/airside projects would induce demand, and called for a DEIS/R that would analyze the inducement factor in a "comprehensive landside/airside" context. 61.9

The DEIS/R pays lip service to these comments by including a section entitled "Cumulative Impacts." However, it ignores the substance of the comments. In the "Cumulative Impacts" section of the DEIS/R, Massport and FAA simply return to their prior position that "[a]irside improvements ...do not relate to or affect any of the landside facilities or operations, and consequently, do not change any of the" environmental analyses. This again flies in the face of the expert opinions of the Secretary of Environmental Affairs and the EPA, as well as common experience and common sense. For example, if Massport cannot find ways to get 45 million or even 37.5 million passengers to and from Logan, then it is certainly reasonable to assume that less people will fly into and out of Logan and the need for the airside Project diminishes. Similarly, if you do not build the airside Project and, as a result, delays increase dramatically, then it is also reasonable to assume that passenger and operation levels will decrease and you may not need, for instance, the second phase of the West Garage. In short, the entire Logan package, Logan 2000 and the Project, will work together and be anything but "demand neutral." That package will induce demand; or, by its absence will cumulatively reduce demand.

The DEIS/R needs to examine all of the ramifications of the induced demand factor and its corollary, the negative inducement factor. It must examine if any airport has ever functioned with delays averaging almost one hour per flight and a ground access system that simply cannot handle the tens of millions of cars that Massport and FAA project will be headed for Logan even if Massport achieves its ambitious HOV and transit goals. It must determine how many passengers and operations such a level of delay (or anything close to it) getting to and flying out of the airport would eliminate as passengers choose other modes or perhaps avoid Boston altogether. Then, and only then, can the environmental impacts of the Project versus other alternatives, including the no-build alternative, be compared. 61.10

2. Capacity Enhancement by Design

The demand-inducing aspects of the mere existence of the Project (and its related projects) are exacerbated by the Project's very design, which strongly suggests that it's main purpose is to provide for an increase in operational capacity at Logan rather than just addressing the current delay situation. For example, Massport and FAA claim that Runway 14/32 is designed primarily to deal with the problem of wind-related delays. However, according to the DEIS/R, such delays occur only 11% of the time. What will be the effect of using Runway 14/32 the other 89% of the time? Severe wind delays (1 runway) occur only 10 days per year. What will 14/32 be used for on the other 355 days? Runway 14/32 is designed to handle 70,000 operations per year. Do you need to handle 70,000 flights (13% of all operations) just to deal with 14/32's projected share of the delay reduction activity? It certainly seems that Runway 14/32 is designed to allow Logan to increase its overall capacity rather than to just address wind-related delays. 61.11

The same can be said for the taxiway improvements. According to the DEIS/R, the taxiway improvements have no effect on runway-related (or wind -related) delays. Further, taxiway traffic issues are only a very small part of the delay problem. If the purpose of the Project, as stated in the DEIS/R, is "[t]o address the delay problem at Logan" then the taxiway improvements are not necessary. Clearly, the taxiway improvements are necessary and are designed to enable the project proponents to push more people and planes through Logan, not to deal with the delay problem. 61.12

Indeed, if delays at Logan are the problem that the Project is supposedly designed to address, then it appears to be a poor solution. Even with all of the airside "improvements," the DEIS/R only projects a 30% improvement in the delay picture. What is being done about the other 70% of the problem? The Secretary's decision on the ENF recognized this incongruity. That decision required the DEIS/R to discuss delays from non-wind related conditions, such as delays started at other airports. The DEIS/R fails to meet this requirement. 61.13

Are new runways and other airside "improvements" really the only answer to the delay problem? According to the DEIS/R, there are five airports in the U.S. which have a greater level of delay than Logan. Are those airports proposing new runways and taxiway improvements? 61.14

The DEIS/R does not tell us. Are those airports addressing their more severe delay problems with other alternatives? Again the DEIS/R is silent. Are the cities that experience more delay than Logan suffering from a lack of tourist, convention and business travel? The reader of the DEIS/R is not provided with such information, but he or she is told that such will be the fate of Boston if the Project is not built.

If wind-related delay reduction is not the major goal of the Project, then what is? Note that Logan ranks 6th in delays and 11th in operations, but only 17th in passenger volume. Clearly, delays are not attributable to the crush of tourists, conventioneers and businesspeople that the Project's backers insist will disappear if the Project is not built. If that were the case, then the passenger volume ranking would not be so low. These rankings suggest that the real problem which the Project is aimed at may be the crush of small commuter and shuttle flights which cause the high operations to passenger ranking ratio. 61.15

Thus, the Project appears to be anything but "demand neutral." Its very existence in isolation would induce demand by virtue of the fact that it will make air travel from Logan significantly more attractive than it would be absent the Project. That inducement is compounded by the synergy of the Project with the Logan 2000 landside improvements and the Third Harbor Tunnel, which allow passengers to get to and from the flights that the airside "improvements" will accommodate. The Project is also designed to accommodate, handle and thus induce much more than air traffic affected by wind-related delays. It is designed to enable Logan's managers to pump an ever-increasing amount of operations through the airport. That is the only way that the demand projections for the year 2010 can be met.

2. The Project's Environmental Impacts are Understated

A. Fleet and Passenger Levels Cannot be the Same for All Alternatives

Once one acknowledges the fact that the Project is not "demand neutral," but instead represents a powerful engine for accommodating and inducing the growth of operations at Logan, it is clear that environmental analyses in the DEIS/R for every medium or pollutant significantly understate the impacts of the Project. This stems from the fact that the DEIS/R assumes that the Project will have absolutely no impact on demand at Logan and therefore applies the same fleet and passenger levels to each alternative analyzed, including the no build alternative. With this simplistic approach (questioned by both the EPA and EOEA), Massport and FAA can claim that the Project will produce environmental "benefits." These "benefits" stem from the fact that if fleet and passenger levels are equal for every alternative, then the preferred alternative will always move that equal number of planes and passengers through the airport more quickly and thus more cleanly. The aircraft will move beyond the relevant airshed, noiseshed, etc. more rapidly, thereby "reducing" impacts. However, alternatives 2, 3 and 4 (all of which exclude the new runway and two of which exclude all of the physical "improvements") should not be compared to the preferred alternative at the same fleet and passenger levels. This is because, as demonstrated above, the very "efficiency" of the preferred alternative, and the 61.16

delays associated with the "inefficiencies" of alternatives 2, 3 and 4 would change the demand levels (and thus the fleet and passenger levels) at any point in time.

Take for example the impact on Court Road residences in Winthrop from taxiway noise. Under alternative 1A (the preferred alternative) a certain level of passengers and operations will produce a level of impact. That level should be greater than the level produced under alternative 4 (the true "no build" alternative) at any given time because under alternative 4 there should be less demand for air travel and thus less passengers and operations. The DEIS/R, however, ignores the induced demand and capacity enhancement attributes of the preferred alternative and simply assumes that the same number of people will fly into and out of Logan under alternatives 1A and 4, even as delays approach one hour for each operation as projected under alternative 4. The result is that both the alleged environmental "advantage" of the preferred alternative and the environmental impacts of alternative 4 are overstated.

B. Even Without the Induced Demand Factor, Impacts are Ignored or Miscalculated

(i). Noise

Noise is a particularly troublesome factor for Winthrop. The DEIS/R presents a confusing and often inconsistent picture of the Project's noise impacts. This approach fails to meet MEPA/NEPA standards as well as certain specific requirements of the comments and decision on the ENF. 61.17

The noise data and the conclusions derived therefrom in the DEIS/R are flawed. Massport continues to employ its computer noise models even when it knows that the models understate actual noise, especially in Winthrop. For example, the DEIS/R utilizes noise data for 1993 from the models when actual, real life data from noise monitors is available which shows higher noise levels.

Why does the DEIS/R utilize 1993 as the noise baseline year? That year featured the highest number of operations until last year, the highest delay ranking in Logan's history, a lower percentage of Stage 3 aircraft in the fleet than you would find in subsequent years, and in 1993 the INM model had not yet been corrected to cure the understatement of noise. In short, 1993 seems to be a fairly "dirty" and inaccurate baseline choice. Its use may overstate the alleged "improvements" from the Project. 61.18

A basic premise of the DEIS/R is that without the airside "improvements" Logan will become a "north-south" airport. Winthrop is to the east of Logan. Presumably, Winthrop would be a candidate for more noise with the "improvements." Yet the DEIS/R purports to demonstrate that Winthrop gets less noise with the Project. That does not make sense. 61.19

Ground taxi noise is a particular problem for Winthrop residents, especially at Court Road. Indeed, the DEIS/R shows that the highest level of ground taxi noise is found at Court 61.20

Road, from aircraft taxiing to the 22 runways for departure. How then, can Massport and FAA claim that a centerfield taxiway which brings more planes per hour to the 22s for departure somehow reduces noise on Court Road? The answer should not be just "increased efficiency" because the data show that even with all of the airside improvements delays will increase by a factor 1.4.

The Secretary's decision on the ENF specifically requested that the DEIS/R should include the 60 dB contour. This is important for Winthrop and many other communities since the DEIS/R acknowledges that the population within the 65 dB contour actually goes up with the addition of the airside "improvements." Naturally, one wonders if the same is true for the 60 dB contour. It is. While the DEIS/R does not include the 60 dB contours throughout the main text, hidden away in Appendix L, Table 1.1 is data demonstrating that the population exposed to 60 dB with the airside "improvements" goes up in every fleet scenario. 61.21

Even utilizing Massport/FAA's flawed assumption that the Project has nothing to do with demand and passenger levels, it is clear that the airside "improvements" do not deliver the promised noise benefits for portions of Winthrop. The important "night time equivalent" sound level values go up in Winthrop in the 29 million low fleet scenario at 4 out of 5 monitoring locations when you add Runway 14/32. In the 37.5 million low fleet scenario, adding 14/32 makes these values go up at 2 out of the 5 locations in Winthrop. Similarly, sound from ground operations increases in Winthrop with the addition of airside "improvements." At both the Somerset and Johnson as well as the Loring and Court Road locations noise goes up with the "improvements" versus the no action alternative. 61.22

(ii). Air/Odor Pollution

Massport and FAA do not seem to have taken EPA's comments on the air pollution issue seriously. EPA called for an inventory of total air toxics. Where is it? EPA requested a combination of all landside and airside emissions. It is difficult to determine if that analysis is included in the DEIS/R. 61.23

The issue of the Project's conformity with the federal Clean Air Act is an important one. As with the issue of demand and cumulative impacts, Massport and FAA simply assume the issue away. They come to the rather tortured conclusion that no Conformity Determination is required under the Clean Air Act, even though emissions go up for just about every category of pollutant if the Project is built. Their "reasoning," once again, is that the preferred alternative results in an alleged "reduction" of air pollutants when compared to the no action alternatives <u>at the same fleet and passenger levels.</u> Such reasoning, as demonstrated above, completely ignores the induced demand issue and the cumulative effects issue that EPA noted. It further ignores the simple common sense argument that it is highly unlikely (if not impossible) that anything close to 45 million or even 37.5 million passengers will utilize Logan if delays for each takeoff and landing average about an hour and ground access is a nightmarish experience. 61.24

The Massport and FAA "theory" that the Project does not require a Conformity Determination is simply asserted in the DEIS/R without any citation or reference to provisions of the Clean Air Act, its implementing regulations or case law that allow such a conclusion. The fact is that the Project will cause emissions to go up. One such emission is NO x. NO x is one of the precursors of ozone. Massachusetts is a "serious non-attainment" state for ozone under the Clean Air Act, as noted by Administrator DeVillars in his comments on the ENF. The Project will allow or accommodate ever-increasing numbers of Stage 3 aircraft to fly into and out of Logan. Stage 3 aircraft, while quieter, produce more NO x than the noisier planes that they are replacing. Therefore, it is clear that the Project will have a decidedly negative effect on the Commonwealth's ability to meet Clean Air Act requirements. A Conformity Determination should certainly be required. The "theory" in the DEIS/R used to avoid such a Determination finds little support in the facts and the DEIS/R provides no legal support for such a position. 61.25

The DEIS/R goes on at great length to make the case that delays at Logan are extremely costly. However, it is silent on the economic impact of the failure of Massachusetts to achieve required results under the Clean Air Act. Such costs could be astronomical. Failure to achieve the requirements of the Act can result in the loss of federal highway funds. Given the cost of the Central Artery, what would be the impact of such a loss on the Massachusetts economy? Logan is one of the largest generators of pollution in Massachusetts. If Logan helps to trigger a failure to achieve Clean Air Act goals, what will be the costs in terms of added air pollution requirements for private stationary sources, such as utilities and factories? Will businesses relocate because tougher air pollution standards imposed on them as a result of emissions emanating from Logan? 61.26

The dispersion model results do not seem to conform to the inventory model results. For example, at the 37.5 million low fleet scenario, 3 out the 8 pollutants in 2010 for the true no-build alternative are either less than or the same as the results for the preferred alternative. The same holds true for the 37.5 million high fleet scenario in 2010. For the 45 million high fleet scenario, a full half (4/8) of the pollutants measured are less for the true no-build alternative than they are for the preferred alternative. These results draw into question the argument in the DEIS/R that the "efficiency" of the preferred alternative provides clear air pollution benefits over no-build alternatives. 61.27

Finally, the discussion in the DEIS/R of the dispersion modeling results is completely disingenuous and casts further doubt about the air pollution conclusions in the DEIS/R. When the results show that the preferred alternative has a slight advantage over the no-action alternative, the DEIS/R proclaims that the "the lowest levels occur in association with" the preferred alternative. However, when, as noted above, the results show that the no-action alternative has virtually the same advantage over the preferred alternative, the DEIS/R comes to the very different conclusion that "there will be no detectable differences in air quality impacts among the four alternatives," or "there is no significant difference." This lack of consistency in analysis draws into question the conclusions of the DEIS/R. Is it an advocacy document or an impartial environmental disclosure document? 61.28

(iii). Land Use

Both MEPA and NEPA require the DEIR/S to discuss impacts on land use. The CEQ regulations implementing NEPA are quite specific on this requirement. They provide that an environmental impact statement "shall include discussions of:

> (c) possible conflicts between the proposed action and the objectives of... local...land use plans, policies and controls for the area concerned...(g) Urban quality, historic and cultural resources, and the design of the built environment...

40 CFR Section 1502.16 (emphasis added).

There can be no doubt that Winthrop is part of the "area concerned." There can also be no doubt that Winthrop's "built environment," "urban quality," and "historic and cultural resources are heavily impacted by the airport and will be affected by the Project. Indeed, part of the airport lies within Winthrop. Major runways are located only a stone's throw from Winthrop residential neighborhoods and from the Belle Isle Marsh, an important historic and cultural resource. The overflights from Logan have had a considerable impact on land use and land values in certain parts of Winthrop. Airport-related noise and air pollution impacts have helped to shape the "built environment" and "urban quality" of such neighborhoods. A school building listed on the National Register of Historic Places is either in or quite near to the 65 dB contour, as is a park. The use and enjoyment of one of Winthrop's greatest resources. the beach, is heavily impacted by noise from aircraft. 61.29

Yet, the DEIS/R includes the rather astonishing statement that the airside improvements will "not alter existing land use patterns." This is preposterous. Airport development and expansion have already had a major effect on land use in Winthrop. Further expansion associated with the Project will definitely impact land use patterns in Winthrop.

The DEIS/R must explore this. At a minimum it should look into the land use impacts on Winthrop brought about historically by Logan development and passenger growth. That historical experience should be utilized to develop a picture of what impacted portions of Winthrop will be like in 2010 at various passenger and fleet scenarios.

(iv). Wetlands/wildlife habitat/waterways

The DEIS/R claims that the project is not within any wetlands resource area. However, it also states that the Project will need an Order of Conditions from the Boston Conservation Commission. Obviously, then, there is at least a presumption of impact on a resource area. Such impacts need to be discussed. 61.30

There is no mention in the DEIS/R of the possibility that the Project would require an

Order of Conditions from the Winthrop Conservation Commission. Clearly the Project will have an impact on wetlands areas in Winthrop. Noise and exhaust pollution will impact on Belle Isle Marsh. Runoff and outflow increases from new taxiways may wash up on Winthrop shores. These issues should be discussed in the DEIS/R. 61.31

The DEIS/R discusses the issue of the Upland Sandpiper nesting areas, but not in the context of the wildlife habitat portion of the Wetlands Protection Act 61.32

The Project is planned to be constructed on filled tidelands or waterways. It represents a significant expansion of structure on existing fill. The DEIS/R does not discuss any possible need for a Chapter 91 license and/or compliance with the Rivers and Harbors Act or the Clean Water Act. . 61.33

(v). 4f/Article 97

While historic resources in Chelsea are discussed, as noted above, impacted historic and cultural resources in Winthrop are ignored. We note further that the DEIS/R summarily dismisses the acknowledged impacts on historic buildings in Chelsea with the proposed soundproofing of the historic residences affected. Soundproofing is a "band aid" approach. It does not fully mitigate the impacts of repeated noise assaults from jet aircraft. It is quite useless during warm weather when windows will be open and it does nothing for sound impacts outside of the building. It hardly represents all feasible mitigation measures. 61.34

While the DEIS/R correctly points out that the legislation creating the Boston Harbor Islands park reservation may have exempted the islands from the provisions of 4f, the quoted legislation does not exempt the park reservation from MEPA and NEPA. In short, just because Congress saw fit to eliminate the Harbor Islands park area as a potential resources for purposes of 4f litigation in connection with airport activities, it does not mean that Congress meant that the environmental impacts on the islands from airport expansion should be ignored for MEPA and NEPA purposes. The Project will clearly have a major impact on the Harbor Islands parkland. It will create major noise problems for those making use of the islands and change the entire experience of anyone exploring the Harbor Islands. Such impacts need to be discussed and analyzed. 61.35

Further, while federal legislation may have exempted the Harbor Islands from 4f litigation, it did not explicitly exempt the Islands for Article 97 purposes. The possible applicability of Article 97 of the Massachusetts Constitution should be explored in the DEIS/R. 61.36

(vi). PRAS benefits

The DEIS/R makes much of the assertion that the Project will enable Massport and the FAA to better achieve PRAS goals. Assuming, for the sake of argument, that this proposition is true, the DEIS/R should take into account the fact that the PRAS goals are almost 20 years old. 61.37

The world has changed a great deal in 20 years. Achievement of the PRAS goals should not, then, be deemed such a terrific benefit automatically. The DEIS/R should discuss whether or not the PRAS goals need revision in order to actually maximize environmental benefits. 61.37 (cont.)

It is also unclear from the DEIS/R just how much compliance with PRAS goals the Project might actually produce. The data in the DEIS/R is all over the map. For some runways the no-action alternative actually results in better PRAS compliance when compared to the preferred alternative. These discrepancies should be laid out and discussed fully in the DEIS/R. 61.38

(vii). Public health

Public health issues relating to airport activity remain a major concern in Winthrop and in other "close-in" communities. Massport was required to present public health issues in its GEIR process for Logan 2000. The result was far from adequate. It was mostly a recitation of Massport monitoring meetings convened by other agencies. The Department of Public Health commented that Massport's presentation was not particularly useful or accurate.

The DEIS/R fails to advance the inquiry into airport-related public health issues. The Project will clearly enhance capacity at Logan and thus increase noise and emissions. According to the report of the Natural Resources Defense Council, Flying Off Course (NRDC 1996), a 1993 EPA study (EPA, Estimation and Evaluation of Cancer Risks Attributable to Air Pollution in Southwest Chicago) ranked aircraft engine emissions ahead of steel mills, hazardous waste treatment plants and other industrial facilities as a potential health hazard. That study concluded that aircraft engines are responsible for 10.5% of the cancer cases in southwest Chicago caused by toxic air pollution. It noted that "it is no surprise that emissions from aircraft engines may have a significant impact on the people living in the study area, especially to people living at receptors adjacent to the airport." The NRDC report also notes that the United Nations is concerned about NO x emissions from airplanes and has considered tightening international controls. 61.39

The DEIS/R should note these studies, update them and present a comprehensive review of what is known about the health effects of airport noise and emissions. Massport and the FAA should work closely with Massachusetts and federal health agencies to address the legitimate health concerns of Winthrop residents who are exposed to potentially harmful emissions. Since the Project will increase those emissions, the DEIS/R must deal with this subject. Massport failed to do so adequately in the GEIR. It is time address the issue properly.

3. Reasonable Alternatives are Not Considered

When Massport's Executive Director came to Winthrop prior to the publication of the DEIS/R to discuss the Project, he was asked if Massport had any alternatives to the proposed Project. His rather surprising answer was quite simply, "No." In other words, Massport had already made up its mind that the Project was the only possible way to address air transportation

in the Boston area. Before the Executive Director had even seen the impacts of the Project, he had already made up his mind that there were no viable alternatives.

Such a statement flies in the face of the purposes of MEPA and NEPA. It is not surprising, then, that the DEIS/R ignores several reasonable alternatives. Rather than discussing and comparing such alternatives, the entire alternatives discussion in the DEIS/R centers on various combinations of airside "improvements" and the no-build alternative. It neglects true alternatives to the Project.

61.40

Two such alternatives involve other airports. There is no discussion in the DEIS/R about a second major airport. Given the ground access and other constraints confronting Logan, a second airport is clearly an option that is worth consideration. It is also clearly reasonable, since second airports have been employed with success in other situations similar to Boston. Dulles Airport in Washington is an example.

Another airport alternative ignored by the DEIS/R is Hanscom Field. This facility is owned by Massport, has adequate runways, is convenient to Boston and is underutilized. The DEIS/R does not explore the possibility of opening up Hanscom to commercial passenger and/or freight traffic. It does not discuss the fact that Federal Express once operated out of Hanscom or that the Hanscom Master Plan, agreed to by the surrounding towns, allows for an increase in operations over the current level. It also fails to acknowledge that many of the so-called "operations" at Hanscom are "touch and go" training exercises where each "touch" and each "go" is considered a separate operation, thus greatly inflating the operational level at Hanscom.

61.41

Another alternative is that of stopping the proposed centerfield taxiway at Runway 15/33. This alternative would greatly reduce taxiway noise and pollution for Winthrop residents. It is not even mentioned in the DEIS/R.

61.42

The DEIS/R makes an attempt at discussing "support" for other transportation modes which can divert air passenger traffic from Logan, but on close inspection the discussion reveals a complete lack of effort in this regard. Most of the studies that are cited in the DEIS are several years old. Massport's participation in reviews of projects such as high speed rail, the North Station-South Station Rail Link ("NSRL") and others consists of simply sending a low-level official to attend meetings and keep a seat warm. The DEIS/R should explore <u>real</u> participation by Massport in promoting projects like high speed rail and the NSRL, including the expenditure of funds. The DEIS/R claims that Massport lacks jurisdiction to get involved in such matters. However, Massport has found the "jurisdiction" when it so desires to spend funds on rail infrastructure to Fort Devens, running a bus public transit operation (Logan Express), building highways ($300 million for the Artery/Tunnel project) and advertising to promote Logan Express and other alternative means for ground access to the airport. Why is Massport incapable of promoting and spending money on alternatives to the Project such as high speed rail to New York and Portland, the NSRL and better highway access to the Worcester Airport?

61.43

California and many European countries utilize the Community Noise Equivalent Level ("CNEL") instead of the DNL. The DSEIS/R should present CNEL data. 61.44

Massport and FAA refuse to even consider applying for curfews under the Airport Noise and Capacity Act of 1990. While such an application may be fraught with difficulty, it is still legally available and thus still a reasonable alternative. 61.45

4. Concrete Mitigation Measures are Missing

The MEPA regulations require the DEIS/R to contain Section 61 findings. The document does not meet this requirement. Mitigation commitments are sorely lacking. 61.46

As noted above, soundproofing is not adequate mitigation. It is a "band aid" approach which is completely ineffective for much of the year and totally ineffective outside of a soundproofed building. Yet, the DEIS/R notes repeatedly that soundproofing is the mitigation answer to all noise problems. 61.47

Massport has had years to deal with the Upland Sandpiper habitat problem. Instead of coming up with a plan for mitigation that can be reviewed in the DEIS/R, the document just notes that Massport is working with another state agency to develop options. That is not good enough. 61.48

The DEIS/R assumes that Runway 14/32 will be "unidirectional" only. However, it does not provide any detailed discussion as to how that restriction will be put in place and maintained over time. Indeed, the DEIS/R simply recites that FAA "policy" will keep 14/32 unidirectional. Policies come and go. 61.49

5. Notice of Project Change

Massport filed a Notice of Project Change on February 16, 1999. The Selectmen support a Notice of Project Change and urge that the Secretary require Massport to refile the ENF and recommence the EIR process. More than three years have elapsed between the filing of the ENF and the publication of the DEIS/R. That gap has created significant environmental and procedural consequences that require additional analysis.

First, the ENF for this Project was not a typical ENF filing. It was a detailed scope of work that contained a great deal of environmental analysis which truly structures and defines the DEIS/R. It triggered a tremendous amount of controversy and comment. The Certificate of the Secretary was not a simple determination that an EIR was required. It was an 8-page document that was based on the information and analysis contained in the ENF and the issues raised by the comments. All of that information, analysis and commentary is now "stale." The general public has long forgotten the information and analysis set forth in the ENF. The public is entitled to have the benefit of a fresh ENF.

Obviously, the world of Logan has changed over the last three years. For example, in 1995 (a year for which results may have been available for purposes of the 1996 ENF) Logan's delay ranking was 8th in the U.S. That is considerably different from the 1997 ranking that the DEIS/R emphasizes. Passengers and operations have increased significantly. Projections from the GEIR process for passengers and operations which formed the basis of much of the ENF analysis have been shown to be inaccurate over time and have been revised. In short, the facts presented and debated at the time of the ENF and which formed the basis of the 8-page scoping decision have changed.

Other factors have changed as well. High speed rail will come to Boston this year. Boston-Portland rail service is soon to be a reality. Green and Manchester airports have expanded tremendously. Highway improvements to Worcester are underway. All of these changes suggest a different scope and a different EIR.

Environmental issues have also changed. For example, ozone concerns have become more pronounced. Administrator DeVillars in his comments on the ENF noted that the EIR was to be published in approximately 18 months and he pointed out that during that time there will be an increase in "overall airport-related emissions." That increase has now gone on for more than twice the projected time period, doubling Mr. DeVillar's concerns.

The EPA also stressed concerns about funding. Mr. DeVillars pointed out that the Project was competing for funds with other transportation projects, which may have air quality benefits. That funding pool has dramatically shrunk over the last three years as a result of the combination of the escalation of Central Artery costs and reduced overall federal funding.

Accordingly, the Secretary should determine that things have changed and the ENF process must be repeated.

For all of the foregoing reasons, the DEIS/R must be deemed inadequate.

Sincerely,

Robert L. Driscoll, Jr. (NBG)

Code	Topic 1	Topic 2	Comment	Response
61.1	Analysis Assumptions	Passenger Forecasts	The DEIS/R completely ignores the "induced demand" issue highlighted by the EPA in its comments on the Environmental Notification Form/ Scope of Work ("ENF") and required to be studied and included in the DEIS under the regulations of the Council on Environmental Quality. The Project clearly increases capacity and fosters the growth of both passenger volume and aircraft operations at Logan. Yet, the DEIS/R pretends that the Project is somehow "demand neutral."	The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in future passenger and aircraft activity at Logan Airport. The environmental impacts associated with these alternative forecasts have been evaluated in the Logan Airport Airside analysis and GEIRs.

Code	Topic 1	Topic 2	Comment	Response
61.2	Analysis Assumptions	Passenger Forecasts	...[V]irtually all of the environmental impact analyses for the Project are inaccurate because they are based on the same passenger levels for both the Preferred Alternative and the no-build alternative. This means that the DEIS/R significantly understates both the environmental impacts of the Project and the potential for passenger diversion of various alternatives.	The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The analysis in the SDEIS/FEIR includes diversions. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport.
61.3	Environmental Review Process	MEPA	Whole categories of impacts on Winthrop, such as land use patterns, historical and cultural resources and wetlands are ignored.	The FAA and Massport have consulted with the Massachusetts Historical Commission (MHC). The MHC has concurred with the FAA's determination that the Preferred Alternative will have no adverse effect on significant historic properties. Refer to Section 6.3.2 of the Supplemental DEIS/FEIR for a description of historic properties, project impacts and mitigation. As described in Sections 6.3 and 6.5 of the SDEIS/FEIR, no impacts to land use or wetlands would result from the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
61.4	Environmental Review Process	MEPA	Several reasonable alternatives have not been included or analyzed in any meaningful way.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan.* The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
61.5	Open Space/ Parkland	Section 4(f)	The DEIS/R ignores major impacts on 4f resources.	The proposed improvements at Logan Airport will neither incorporate land from the Section 4(f) resource nor affect the normal activity or aesthetic value of a public park, recreation area, wildlife refuge, or historic site. Therefore, the Preferred Alternative does not constitute a use of Section 4(f) resources. In addition, the FAA has determined that there are no feasible or prudent alternatives to the Preferred Alternative that would achieve the delay reduction, safety, transportation, noise distribution, and other objectives of the Preferred Alternative. Therefore, even if the noise levels associated with the Preferred Alternative were determined to interfere with the normal activity associated with the identified Section 4(f) resources (which they do not), the FAA concludes that the sound insulation mitigation proposed for the affected Section 4(f) structures includes all possible planning to minimize harm from that increase in noise. The Massachusetts Historical Commission (MHC) has concurred that the Proposed Project will have no adverse effect on significant historic properties (MHC letter to FAA, December 21, 1999 Sections 6.3.2 and 6.3.3 of the Supplemental DEIS/FEIR provide a summary of Section 4(f) resources within the project area.
61.6	Public Health	Effects	The DEIS/R ignores public health issues.	Massport has provided the City of Boston and public health agencies with air quality and emissions data. In January 1996, Massport reviewed available public health data, including mortality and morbidity from each neighborhood in Boston and cancer incidence data available from the Massachusetts Department of Public Health. These data indicated that causal relationships cannot be determined at this time. A review of the 1999 *Report to the Mayor, Health of Boston* prepared by the Boston Public Health Commission leads to a similar conclusion. In addition, Massport has shared the results of the *Soot Deposition Study* with public health agencies and is cooperating with the Harvard School of Public Health on the *South Boston Particle Source Apportionment Study.* Information on public health issues is provided in Chapter 6 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
61.7	Environmental Review Process	FAA/NEPA MEPA	The DEIS/R fails to meet the requirements of both MEPA and NEPA with respect to mitigation.	Mitigation is addressed in detail in Chapter 8 of the Supplemental DEIS/FEIR The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. Chapter 8 of this Supplemental Draft EIS/FEIR outlines Massport's mitigation commitments associated with the Airside Improvements Planning Project.

Code	Topic 1	Topic 2	Comment	Response
61.8	Analysis Assumptions	Passenger Forecasts	It is well established that major regional transportation initiatives such as highways or runways induce demand. Indeed, the Boston business community and Massport have been promoting the Project in the press with the claim that Boston will lose conventions, tourists, jobs and business meetings if the Project is not built. If...one accepts these claims by Project backers, then it is quite clear that the Project will induce tourists, conventioneers and business people to come to Boston, using Logan to do so. Conversely, if the Project is not built, these same passengers will (according to the business community and Massport) avoid Boston at all costs. Thus, the no-build alternative clearly has a "negative inducement" factor. For example, the DEIS/R claims that if the Project is not built, the average delay at Logan for each takeoff and landing may well reach almost an hour. If that is the case, then the time differential between flying and taking the alternative of high speed rail between Boston and New York is virtually eliminated. Clearly, the effect of such a leveling of the transportation playing field will be to induce more Boston-New York passengers to take the train instead of the shuttle. However, the DEIS/R completely ignores this effect. There is little or no chance that Logan's passenger level would ever approach 45 million under the no-build scenario with average delays of almost an hour per operation.	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
61.9	Analysis Assumptions	Passenger Forecasts	The DEIS/R also fails to look at induced demand issue with regard to the cumulative effects of the combination of Logan 2000 landside program and the Airside Project. Massport and FAA claim that putting a billion dollars into improving ground access, parking and terminal space at Logan (Logan 2000), contributing $300 million to a new harbor tunnel and related highways designed to improve interstate highway access to Logan (Third Harbor Tunnel and Route 1A), and finally creating a new runway and various airside improvements (the Project), all at the same time and in the same location will have absolutely no effect on passenger demand at the airport. The Secretary's decision on the ENF clearly stated that the DEIS/R "should include analysis of cumulative impacts, and should clearly explain the relationship between the Logan 2000 landside program and the Airside improvements." The EPA Regional Administrator stated that the DEIS/R would "provide the critical opportunity" (emphasis in original) to examine the synergistic or cumulative effects of Logan 2000 and the Project. The EPA comments on the ENF described the FAA's environmental review for Logan projects as "segmented." ...The DEIS/R ignores the substance of the comments. ...The entire Logan package, Logan 2000 and the Project, will work together and be anything but "demand neutral." That package will induce demand; or, by its absence will cumulatively reduce demand.	The proposed improvements analyzed in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR involve both construction and administrative actions that will facilitate aircraft operations (landings, takeoffs and taxiing). None of the improvements involve landside facility improvements (e.g., terminals and roadways) or related operations. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze in detail the impacts from aircraft operations, including extensive analysis of noise and air quality impacts during the years 1993, 1998 and under future forecast scenarios as well as environmental benefits from certain of the improvement concepts under review. In this respect, the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR conform with scoping directives from the lead federal agency (the FAA) and with applicable FAA environmental orders, all issued in accordance with NEPA, and with directives from EOEA issued under MEPA. The various GEIR documents, including the most recent *Logan Airport 1998 Annual Update* and the *1999 ESPR*, provide additional analytic context by examining cumulative impacts from airside (i.e., aircraft) operations and landside (e.g., vehicular traffic, terminal service vehicles) operations at Logan Airport as well as Massport's comprehensive mitigation program. The GEIR is specifically incorporated by reference in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR as a background document. Each GEIR submission is subject to public review and comment. The *Logan Airport 1998 Annual Update* and the *1999 ESPR* analyses are based on the same forecast levels used in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. The GEIR informs Massport's planning process for all the improvements at Logan Airport, including the improvements under review in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. The GEIR is specifically referenced in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. These documents also discuss the relationship of the GEIR/ESPR analysis to the Airside Project analysis. Consistent with past practice, Massport expects that the FAA will take the GEIR/ESPR analysis into account during its deliberations and ultimate decision on the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
61.10	Analysis Assumptions	Passenger Forecasts	The DEIS/R needs to examine all of the ramifications of the induced demand factor and its corollary, the negative inducement factor. It must examine if any airport has ever functioned with delays averaging almost one hour per flight and a ground access system that simply cannot handle the tens of millions of cars that Massport and FAA project will be headed for Logan even if Massport achieves its ambitious HOV and transit goals. It must determine how many passengers and operations such a level of delay (or anything close to it) getting to and flying out of the airport would eliminate as passengers choose other modes or perhaps avoid Boston altogether.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.
61.11	Purpose and Need	Delays	The Project's design strongly suggests that its main purpose is to provide for an increase in operational capacity at Logan rather than just addressing the current delay situation. For example, Massport and FAA claim that Runway 14/32 is designed primarily to deal with the problem of wind-related delays. However, according to the DEIS/R, such delays occur only 11% of the time. What will be the effect of using Runway 14/32 the other 89% of the time? Severe wind delays (1 runway) occur only 10 days per year. What will 14/32 be used for on the other 355 days? Runway 14/32 is designed to handle 70,000 operations per year. Do you need to handle 70,000 flights (13% of all operations) just to deal with 14/32's projected share of the delay reduction activity? It certainly seems that Runway 14/32 is designed to allow Logan to increase its overall capacity rather than to just address wind-related delays.	Implementation of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway would substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays would represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred without the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in current and future passenger and aircraft activity at Logan Airport.
61.12	Purpose and Need	Delays	According to the DEIS/R, the taxiway improvements have no effect on runway-related (or wind-related) delays. Further, taxiway traffic issues are only a very small part of the delay problem. If the purpose of the Project, as stated in the DEIS/R, is "[t]o address the delay problem at Logan" then the taxiway improvements are not necessary. Clearly, the taxiway improvements are necessary and are designed to enable the project proponents to push more people and planes through Logan, not to deal with the delay problem.	While taxiway delays are much lower than runway delays, the taxiway improvements will provide 15,000 to 21,000 annual hours of delay reduction in future scenarios. Just as importantly, the taxiway improvements will increase airfield safety and operational efficiency. Finally, by decreasing ground delays, these improvements will also result in small reductions in noise and air quality impacts of the airfield.

Code	Topic 1	Topic 2	Comment	Response
61.13	Purpose and Need	Delays	Even with all of the airside "improvements," the DEIS/R only projects a 30% improvement in the delay picture. What is being done about the other 70% of the problem? The Secretary's decision on the ENF recognized this incongruity. That decision required the DEIS/R to discuss delays from non-wind related conditions, such as delays started at other airports. The DEIS/R fails to meet this requirement.	The Airside Project is designed to reduce delays from to adverse winds and taxiway congestion. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach the 1999 passenger forecast (29 million) presented in the Draft EIR/EIR until 2002 or 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts will not be achieved until after 2020. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts." To "Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport may not reach 29 million passengers, presented in the Airside Project Draft EIS/EIR as a "1999" projection, until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is expected to reach 37.5 million passengers in 2015 rather than 2010, and the 45 million passenger forecasts will not be achieved until 2024. Thus, the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts.
61.14	Purpose and Need	Delays	Are new runways and other airside "improvements" really the only answer to the delay problem? According to the DEIS/R, there are five airports in the U.S. which have a greater level of delay than Logan. Are those airports proposing new runways and taxiway improvements? The DEIS/R does not tell us. Are those airports addressing their more severe delay problems with other alternatives? Again the DEIS/R is silent. Are the cities that experience more delay than Logan suffering from a lack of tourist, convention and business travel? The reader of the DEIS/R is not provided with such information, but he or she is told that such will be the fate of Boston if the Project is not built.	Airports with greater delays than Logan Airport (ranked by total OPSNET delays) include Atlanta, Newark, La Guardia, Chicago O'Hare, and San Francisco International. According to the 1998 Aviation Capacity Enhancement Plan, a fifth parallel commuter runway is under design for Hartsfield Atlanta International Airport, and Newark International Airport is constructing an extension for Runway 4L/22R. Other major airports studying or constructing runway improvements include Lambert St Louis, Philadelphia, Dallas – Fort Worth, Detroit Metropolitan Wayne County, Washington Dulles, Minneapolis-St. Paul, and Seattle-Tacoma, all which are ranked in the top 20 airports in terms of total OPSNET delays in 1998.

Code	Topic 1	Topic 2	Comment	Response
61.15	Purpose and Need	Delays	Note that Logan ranks 6th in delays and 11th in operations, but only 17th in passenger volume. Clearly, delays are not attributable to the crush of tourists, conventioneers and businesspeople that the Project's backers insist will disappear if the Project is not built. If that were the case, then the passenger volume ranking would not be so low. These rankings suggest that the real problem which the Project is aimed at may be the crush of small commuter and shuttle flights which cause the high operations to passenger ranking ratio.	The delay measures and Massport's modeling both show that Logan Airport continues to suffer from serious airside delays despite the regional carrier consolidation and the decline in regional carrier operations. Regional carrier consolidation did not substantially reduce delays at Logan Airport because airline overscheduling is not a significant cause of delays at Logan Airport. As the Airside Project analysis shows, the lack of a three-runway configuration to handle arriving flights during periods of northwest winds is a major source of Logan Airport delays. Furthermore, the impact of regional carrier consolidation on future delay levels was explicitly examined through the analysis of several future "Low" fleet scenarios, which assume that commuter aircraft comprise a smaller share of Logan Airport's fleet compared to the "High" fleet scenario (new fleet, incorporating a significant proportion of regional jets was also analyzed). Even future Low fleet scenarios show significant levels of delays at Logan Airport. Based on actual experience and the Airside Project modeling, further regional carrier consolidation is not expected to have a significant impact on delay levels in Low fleet conditions. In high fleet conditions, when airline overscheduling is a major contributor to delays, regional carrier flight consolidation reduces delay levels. Massport proposes to monitor airline overscheduling conditions and to seek voluntary schedule adjustments from airlines to reduce delays caused by overscheduling. If airlines do not voluntarily comply, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.
61.16	Analysis Assumptions	Passenger Forecasts	Alternatives 2, 3 and 4 (all of which exclude the new runway and two of which exclude all of the physical "improvements") should not be compared to the Preferred Alternative at the same fleet and passenger levels. This is because, the very "efficiency" of the Preferred Alternative, and the delays associated with the "inefficiencies" of alternatives 2, 3 and 4 would change the demand levels (and thus the fleet and passenger levels) at any point in time.	The Preferred Alternative will not create additional passenger demand or flight operations at Logan Airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in future passenger and aircraft activity at Logan Airport. The environmental impacts associated with these alternative forecasts have been evaluated in the Logan Airport Airside analysis and GEIRs.

Code	Topic 1	Topic 2	Comment	Response
61.17	Noise	Model	The DEIS/R presents a confusing and often inconsistent picture of the Project's noise impacts. This approach fails to meet MEPA/ EPA standards, as well as certain specific requirements of the comments and decision on the ENF. The noise data and the conclusions derived therefrom in the DEIS/R are flawed. Massport continues to employ its computer noise models even when it knows that the models understate actual noise, especially in Winthrop. For example, the DEIS/R utilizes noise data for 1993 from the models when actual, real life data from noise monitors is available which shows higher noise levels.	The standard FAA INM is known to produce results that are lower than the Day-Night Sound Levels measured at some of the Massport microphones. To minimize this error, the measured data for 1993 at the close-in monitors were compared to calculated values for the actual 1993 operations using 1993 runway use, day-night split. 1993 is representative of historic high fleet operating conditions at Logan Airport. The results showed that the monitors at the edge of the airport, which were primarily affected by noise radiated during aircraft ground roll, were low by an average of 6.5 dB. Those monitors, primarily affected by landing noise, were low by an average of 4 dB. However, those affected by takeoff noise radiated after the aircraft was airborne (noise levels in Point Shirley, for example) were ±1 dB. Accordingly, in preparation for this study, Massport requested that the FAA approve an adjustment to the INM 5.0 database to add six dB to the noise radiated during ground roll and 4 dB to the noise radiated during the final phase of approach. These corrections were approved and were implemented throughout the Logan Airport Airside Project planning studies.
61.18	Analysis Assumptions	Base Year	Why does the DEIS/R utilize 1993 as the noise baseline year? That year featured the highest number of operations until last year, the highest delay ranking in Logan's history, a lower percentage of Stage 3 aircraft in the fleet than you would find in subsequent years, and in 1993 the INM model had not yet been corrected to cure the understatement of noise. In short, alleged "improvements" from the Project.	The Airside Project has independent utility from existing and proposed landside projects at Logan Airport.
61.19	Noise	Impacts	A basic premise of the DEIS/R is that without the airside " improvements" Logan will become a "north-south" airport. Winthrop is to east of Logan. Presumably, Winthrop would be a candidate for more noise with the "improvements." Yet the DEIS/R purports to demonstrate that Winthrop gets less noise with the Project. That does not make sense.	The principal noise impacts to Winthrop occur in the Point Shirley neighborhoods from departures on Runway 9 and arrivals on Runway 27, in the Court Road neighborhood by departures on Runway 22L/7R, and in the Amelia and Morton location by Runway 4R departures and Runway 22L arrivals and departures. Examination of the effective jet departures for the various alternatives and fleets in Table 6.2.2 of the Supplemental DEIS/FEIR shows that the effective jet departures on Runway 9 are significantly reduced by the Preferred Alternative. This is consistent with the North-South flow since the principal runways used in the northerly flow are Runway 4 for arrivals and Runway 9 plus Runway 4 for departures, with the main load on Runway 9. In Table 6.2.2 of the Supplemental DEIS/FEIR, the effective jet arrivals on Runway 27 are increased by four percent in the 29M Low Fleet scenario and decreased by 3.7 percent in the 37.5M Low Fleet scenario. These data are consistent with the analysis of the Day-Night Sound Levels values at Point Shirley. Examination of Runway 22 effective jet departures in Table 6.2.2 of the Supplemental DEIS/FEIR shows an increase of 0.7 percent for the Preferred Alternative in the 29M Low Fleet scenario and a decrease of 9.2 percent in the 37.5M Low Fleet scenario. Departures on Runway 4 show increases of 0.1 percent and 0.2 percent in those two years. Effective jet arrivals on Runway 22L show decreases of 0.1 percent and 1.9 percent, respectively.

Code	Topic 1	Topic 2	Comment	Response
61.20	Alternatives	Taxiway Improvements	Ground taxi noise is a particular problem for Winthrop residents, especially at Court Road. Indeed, the DEIS/R shows that the highest level of ground taxi noise is found at Court Road, from aircraft taxiing to the 22 runway for departure. How then, can Massport and FAA claim that a centerfield taxiway which brings more planes per hour to the 22s for departure somehow reduces noise on Court Road?	The taxiway improvements are designed to improve ground movement efficiency and safety, and to reduce taxiing delays, thereby reducing associated noise and emissions. Section 3.3 of the Supplemental DEIS/FEIR describes several operating situations that would benefit from these improvements. Unidirectional Runway 14/32 would allow more evenly distributed runway use, reducing the use of the Runways 4/22 from 60 to 70 percent to 35 to 40 percent. When using Runways 22L/R for departures, the Centerfield Taxiway would be used for Runway 22L departures to bypass the queue for Runway 22R.
61.21	Noise	Model	The Secretary's decision on the ENF specifically requested that the DEIS/R should include the 60 dB contour. While the DEIS/R does not include the 60 dB contours throughout the main text, hidden away in Appendix L, Table 1.1 is data demonstrating that the population exposed to 60 dB with the airside "improvements" goes up in every fleet scenario.	Refer to Tables 5.2-3 and 6.2-3 through 6.2-5 of the Supplemental DEIS/FEIR for population data down to DNL values of 60 dB. Also, refer to newly included and newly excluded populations attributable to the Preferred Alternative in Tables 6.2-5 through 6.2-7 of the Supplemental DEIS/FEIR.
61.22	Alternatives	Runway 14/32	... [I]t is clear that the airside "improvements" do not deliver the promised noise benefits for portions of Winthrop. The important "night time equivalent" sound level values go up in Winthrop in the 29 million low fleet scenario at 4 out of 5 monitoring locations when you add Runway 14/32. In the 37.5 million low fleet scenario adding 14/32 makes these values go up at 2 out of the 5 locations in Winthrop.	Refer to Tables 5.2-3 and 6.2-3 through 6.2-5 of the Supplemental DEIS/FEIR for population data down to DNL values of 60 dB. Also, refer to newly included and newly excluded populations attributable to the Preferred Alternative in Tables 6.2-5 through 6.2-7 of the Supplemental DEIS/FEIR. The nighttime equivalent sound levels (LeqN) at the two microphones at Point Shirley are estimated to change by +0.4 dB and -0.7 dB at Monitor Nos. 4 and 5 for the 29M Low Fleet scenario, and by -0.4 dB and -0.9 dB at the same monitors for the 37.5M Low Fleet scenario. More importantly, the Day-Night Sound Levels (DNLs) at these locations change by -0.9 dB and –1.7 dB for the 29M Low Fleet scenario and by –1.3 dB and –.2 dB for the 37.5M Low Fleet scenario. This area also has a significant reduction in both persistence and dwell for these two fleets (refer to "Arr 27/Dep 9" on Figures 6.2-5 through 6.2-8 of the Supplemental DEIS/FEIR). These changes are improvements in the noise environment. The nighttime noise (LeqN) at Monitor No. 6 at Somerset and Johnson are estimated to change by +0.1 dB for the 1999 29M Low Fleet scenario, and –0.4 dB for the 37.5M Low Fleet scenario. The DNLs at this location change by +0.2 dB for the 29M Low Fleet scenario and by 0 dB for the 37.5M Low Fleet scenario. These changes represent no perceptible change in the noise environment. The LeqN at the two microphones near Runway 4R/22L are estimated to change by +3.2 dB and +0.9 dB at Monitor Nos. 7 and 8 for the 29M Low Fleet scenario, and by +0.9 dB and by -0.9 dB at the same monitors for the 37.5M Low Fleet scenarios. The DNLs at these locations change by +1.5 dB and –0.1 dB for the 29M Low Fleet scenario and by –0.3 dB and -1.1 dB for the 37.5M Low Fleet scenarios. These changes show an increase at Monitor No. 7 at Court Road and no net change at Monitor No. 8 at the Amelia and Morton location in 1999, but generally show decreases for the 37.5M Low Fleet scenarios for a net improvement in the noise environment in 2010. This area also has a significant reduction in both persistence and dwell for these two fleet scenarios (refer to "Arr 22/Dep 4" in Figures 6.2-5 through 6.2-8 of the Supplemental DEIS/FEIR).

Code	Topic 1	Topic 2	Comment	Response
61.23	Air Quality	Model	Massport and FAA do not seem to have taken EPA's comments on the air pollution issue seriously. EPA called for an inventory of total air toxics. Where is it? EPA requested a combination of all landside and airside emissions. It is difficult to determine if that analysis is included in the DEIS/R.	The emission inventory in the Supplemental DEIS/FEIR includes both landside and airside emissions associated with Logan Airport.
61.24	Air Quality	State Implementation Plan	The issue of the Project's conformity with the federal Clean Air Act is an important one. Massport and FAA come to the conclusion that no Conformity Determination is required under the Clean Air Act, even though emissions go up for just about every category of pollutant if the Project is built. Their "reasoning," once again, is that the Preferred Alternative results in an alleged "reduction" of air pollutants when compared to the no action alternatives at the same fleet and passenger levels. Such reasoning, as demonstrated above completely ignores the induced demand issue and the cumulative effects issue that EPA noted.	Current guidance in 40 CFR 93, *Determining Conformity of Federal Actions to State or Federal Implementation Plans*, specifies procedures to determine the conformity of projects, like the Airside Project, to the Massachusetts State Implementation Plan (SIP). Based on this guidance, the project-related emissions are *de minimis*, and the Airside Project therefore conforms to the SIP.
61.25	Air Quality	State Implementation Plan	The Massport and FAA "theory" that, the Project does not require a Conformity Determination is simply asserted in the DEIS/R without any citation or reference to provisions of the Clean Air Act, its implementing regulations or case law that allow such a conclusion. The fact is that the Project will cause emissions to go up. One such emission is NOx. NOx is one of the precursors of ozone. Massachusetts is a "serious non-attainment" state for ozone under the Clean Air Act, as noted by Administrator DeVillars in his comments on the ENF. The Project will allow or accommodate ever-increasing numbers of Stage 3 aircraft to fly into and out of Logan. Stage 3 aircraft, while quieter, produce more NOx than the noisier planes that they are replacing. Therefore, it is clear that the Project will have a decidedly negative effect on the Commonwealth's ability to meet Clean Air Act requirements. A Conformity Determination should certainly be required.	Emissions of ozone precursors, NO_x and VOCs, decrease under the Build Alternatives, when compared to the No Action Alternative. Current guidance in 40 CFR 93, *Determining Conformity of Federal Actions to State or Federal Implementation Plans*, specifies procedures to determine the conformity of projects, like the Airside Project, to the Massachusetts State Implementation Plan (SIP). Based on this guidance, the project-related emissions are *de minimis*, and the Airside Project therefore conforms to the SIP.
61.26	Air Quality	State Implementation Plan	The DEIS/R goes on at great length to make the case that delays at Logan are extremely costly. However, it is silent on the economic impact of the failure of Massachusetts to achieve required results under the Clean Air Act. Failure to achieve the requirements of the Act can result in the loss of federal highway funds. Given the cost of the Central Artery, what would be the impact of such a loss on the Massachusetts economy?	The General Conformity provision of the CAA prohibits any federal agency, including the FAA, from approving, funding or permitting any project or action that does not conform to the State Implementation Plan (SIP) – the plan developed by DEP and approved by the EPA to achieve the goals and requirements of the CAA. In this case the planned improvements to Logan Airport have been shown to conform to the SIP because the emissions associated with the projects are well within the de minimis levels of the General Conformity rule. Based on this finding, the projects are not viewed as being an impediment to the Commonwealth's progress in meeting the requirements of the CAA

Code	Topic 1	Topic 2	Comment	Response
61.27	Air Quality	Impacts	The dispersion model results do not seem to conform to the inventory model results. For example, at the 37.5 million low fleet scenario, 3 out the 8 pollutants in 2010 for the true no-build alternative are either less than or the same as the results for the Preferred Alternative, The same holds true for the 37.5 million high fleet scenario in 2010. For the 45 million high fleet scenario, a full half (4/8) of the pollutants measured are less for the true no-build alternative than they are for the Preferred Alternative. These results draw into question the argument in the DEIS/R that the "efficiency" of the Preferred Alternative provides clear air pollution benefits over no-build alternatives.	For ease in assimilating the data, the dispersion modeling results are presented in both the tables and the figures of the EIS/R as the "highest predicted level" at each of the 12 receptors, irrespective of the wind conditions. In other words, it is highly unlikely (if not impossible) for all of these highest predicted concentrations to occur simultaneously. Rather, when wind conditions cause the highest concentrations at receptors on one side of the airport, receptors on the other side of the airport would experience concentrations less than their maximum predicted levels. This reporting technique was conceived to present the data in a concise way and show the potential worst-case conditions. Another factor that leads to these results is the change in aircraft operations with the planned airfield improvements (e.g. changes in aircraft taxi-in, taxi-out, landing and take-off patterns). While this may lead to small increases in concentrations at some receptors, lower concentrations are predicted to occur at others. In all cases, these changes are very small and will be imperceptible. Most importantly, the predicted concentrations are all well within the NAAQS - standards established by the EPA to protect public health. The emission inventory results show an overall reduction in emissions with the Preferred Alternative when compared to the No-build condition. This finding is more reflective of the improved efficiency realized by the planned improvements.
61.28	Air Quality	Model	The discussion in the DEIS/R of the dispersion modeling results is completely disingenuous and casts further doubt about the air pollution conclusions in the DEIS/R. When the results show that the Preferred Alternative has a slight advantage over the no-action alternative, the DEIS/R proclaims that the "the lowest levels occur in association with" the Preferred Alternative. However, when, as noted above, the results show that the no-action alternative has virtually the same advantage over the Preferred Alternative, the DEIS/R comes to the very different conclusion that "there will be no detectable differences in air quality impacts among the four alternatives," or "there is no significant difference." This lack of consistency in analysis draws into question the conclusions of the DEIS/R.	Generally, the Preferred Alternative has lower emissions and dispersion modeling indicates that pollutant concentrations will be within the NAAQS under all alternatives. Only small differences are seen among the four alternatives, when comparing dispersion modeling results.
61.29	Environmental Review Process	FAA/NEPA, MEPA	Both MEPA and NEPA require the DEIR/S to discuss impacts on land use. The CEQ regulations implementing NEPA are quite specific on this requirement. They provide that a environmental impact statement "shall include discussions of: (c) possible conflicts between the proposed action and the objectives of.. local ... land use plans, policies and controls for the area concerned ...(g) Urban quality, historic and cultural resources, and the design of the built environment... There can be no doubt that Winthrop is part of the "area concerned." There can also be no doubt that Winthrop's "built environment," "urban quality," and "historic and cultural resources are heavily impacted by the airport and will be affected by the Project. ...The overflights from Logan have had a considerable impact on land use and land values in certain parts of Winthrop. Airport-related noise and air pollution impacts have helped to shape the "built environment" and "urban quality" of such neighbor-hoods....Yet, the DEIS/R includes the rather astonishing statement that the airside improvements will "not alter existing land use patterns."... Airport development and expansion have already had a major effect on land use in Winthrop. Further expansion associated with the Project will definitely impact land use patterns in Winthrop.... At a minimum the DEIS/R should look into the land use impacts on Winthrop brought about historically by Logan development and passenger growth. That historical experience should be utilized to develop a picture of what impacted portions of Winthrop will be like in 2010 at various passenger and fleet scenarios.	Refer to Section 6.3 of the Supplemental DEIS/FEIR for a discussion of land use impacts on the surrounding communities.

Code	Topic 1	Topic 2	Comment	Response
61.30	Ecosystems	Wetlands	The DEIS/R claims that the project is not within any wetlands resource area. However. It also states that the Project will need an Order of Conditions from the Boston Conservation Commission. Obviously, then, there is at least a presumption of impact on a resource area. Such impacts need to be discussed.	Portions of the runway construction will involve work in the upland Buffer Zone adjacent to Boston Harbor, though no work in the harbor or adjacent wetlands is proposed. Work in the Buffer Zone will be limited to removal of unsuitable soil materials, minor regrading, placement of new clean fill and construction of the runway. This work requires an Order of Conditions from the Boston Conservation Commission. Details of runway construction impacts are described in Section 6.9 of the Supplemental DEIS/FEIR.
61.31	Ecosystems	Wetlands	There is no mention in the DEIS/R of the possibility that the Project-would require an Order of Conditions from the Winthrop Conservation Commission. Clearly the Project will have an impact on wetlands areas in Winthrop. Noise and exhaust pollution will impact on Belle Marsh. Runoff and outflow increases from new taxiways may wash up on Winthrop shores. These issues should be discussed in the DEIS/R.	The Preferred Alternative will not require an Order of Conditions from the Winthrop Conservation Commission.
61.32	Ecosystems	Rare Species	The DEIS/R discusses the issue of the Upland Sandpiper nesting areas, but not in the context of the wildlife habitat portion of the Wetlands Protection Act.	The Upland Sandpiper is an upland species whose habitat at the airport is comprised primarily of infield areas of the airfield not subject to the Wetlands Protection Act as habitat.
61.33	Ecosystems	Wetlands	The Project is planned to be constructed on filled tidelands or waterways. It represents a significant expansion of structure on existing fill. The DEIS/R does not discuss any possible need for a Chapter 91 license and/or compliance with the Rivers and Harbors Act or the Clean Water Act.	In accordance with Section 310 CMR 9.03(3) of the Chapter 91 Waterways regulations, airport activities conducted by Massport at Logan Airport on previously filled tidelands are exempt from Chapter 91 permitting requirements. No work is proposed in the harbor or areas subject to the River and Harbors Act. A multi-sector NPDES Discharge Permit will be required for Clean Water Act compliance during construction. Massport has an individual NPDES permit for operations of the airport.
61.34	Noise	Sound Insulation	While historic resources in Chelsea are discussed, as noted above, impacted historic and cultural resources in Winthrop are ignored. ...[T]he DEIS/R summarily dismisses the acknowledged impacts on historic buildings in Chelsea with the proposed soundproofing of the historic residences affected. Soundproofing is a "band aid" approach... It hardly represents all feasible mitigation measures.	The Supplemental DEIS/FEIR includes a discussion of historic and cultural resources in Winthrop. Five properties in Winthrop that are included in the Inventory of Historic and Archaeological Assets of the Commonwealth fall within the 65 dB DNL contour (45 Enfield Road, 240 Pleasant Street, 75/77 Somerset Avenue, 88 Somerset Avenue, 94 Somerset Avenue). The implementation of a sound insulation program for affected historic residences is an accepted FAA mitigation, as outlined in FAR Part 150. FAA proposes to mitigate noise impacts by sound insulation all affected residences, historic and non-historic, that fall within the 65 dB DNL contour for the Preferred Alternative.
61.35	Noise	Impacts, Open Space/ Parkland	The Project will clearly have a major impact on the Harbor Islands parkland. It will create major noise problems for those making use of the islands and change the entire experience of anyone exploring the Harbor Islands. Such impacts need to be discussed and analyzed.	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
61.36	Open Space/ Parkland	Article 97	The possible applicability of Article 97 of the Massachusetts Constitution should be explored in the DEIS/R.	The Supplemental DEIS/FEIR contains additional analysis of the project relative to parklands. As depicted in Figure 6.3-4 of the Supplemental DEIS/FEIR, the Arnold Arboretum, Emerald Necklace, and Franklin Park are well outside the 65 dB DNL noise contour associated with the Preferred Alternative. Therefore, the Airside Project will have no impact on these parklands. In addition, the Boston Harbor Islands, while within the No Action Alternative 65 dB DNL noise contour, will have no noise increase under the Preferred Alternative. Refer to Section 6.3 of the Supplemental DEIS/FEIR for additional discussion of parklands. No Article 97 impacts result from any of the alternatives.

Code	Topic 1	Topic 2	Comment	Response
61.37	Noise	PRAS	The DEIS/R should take into account the fact that the PRAS goals are almost 20 years old. The DEIS/R should discuss whether or not the PRAS goals need revision in order to actually maximize environmental benefits.	The PRAS goals were established by the PRAS Advisory Committee during the development of the original computerized system between 1980 and 1983. The advisory committee was composed of representatives from Massport, the FAA, airlines, and 12 neighboring communities. It concluded that the PRAS goals should provide an equitable distribution of aircraft noise over the long-term, as well as short-term relief from excessive operations over certain neighborhoods. The FEIR demonstrates that there have been no significant demographic changes to warrant an update of the PRAS goals. A complete discussion of PRAS, the goals, and historic performance is included in Section 4.3 of the Supplemental DEIS/FEIR.
61.38	Noise	PRAS	It is also unclear from the DEIS/R just how much compliance with PRAS goals the Project might actually produce... For some runways the no-action alternative actually results in better PRAS compliance when compared to the Preferred Alternative. These discrepancies should be laid out and discussed fully in the DEIS/R.	There are no cases where the No Action Alternative provides better achievement of PRAS goals than the Preferred Alternative. Achievement must be compared on an overall basis such as the sum of the absolute or squared deviations from the goals. While the use of one runway may be closer to the goal when comparing the No Action Alternative with the Preferred Alternative, the goal deviation from all runways must be considered. Section 4.3 of the Supplemental DEIS/FEIR contains a complete description of the PRAS system and achievement of historic goals and explains this issue further. Appendix H of the Supplemental DEIS/FEIR presents achievement statistics for each fleet and alternative. Each improvements package provides increased goal achievement when compared with the No Action Alternative, and Alternatives 1 and 1A, which include the Runway 14/32, provide the greatest increase in annual PRAS goal performance.

Code	Topic 1	Topic 2	Comment	Response
61.39	Public Health	Effects	Public health issues relating to airport activity remain a major concern in Winthrop and in other "close-in" communities...The DEIS/R fails to advance the inquiry into airport-related public health issues. The Project will clearly enhance capacity at Logan and thus increase noise and emissions. ...The DEIS/R should note... [the Natural Resources Defense Council and EPA] studies, update them and present a comprehensive review of what is known about the health effects of airport noise and emissions. Massport and the FAA should work closely with Massachusetts and federal health agencies to address the legitimate health concerns of Winthrop residents who are exposed to potentially harmful emissions. Since the Project will increase those emissions, the DEIS/R must deal with this subject.	The available public health studies for communities adjacent to Logan Airport were reviewed and are presented in Section 6.8 of the Supplemental DEIS/FEIR. Public health status reports were available for the City of Boston; however, comparable public health reports were not available from the Public Health Departments of Chelsea, Revere, and Winthrop. A review of the available information did not indicate any causal relationship based on proximity to the airport. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context. Implementation of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway would substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays would represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred without the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the Airside Project operational and environmental analyses capture any potential variation in current and future passenger and aircraft activity at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
61.40	Regional Transportation	Regional Airports	The DEIS/R ignores several reasonable alternatives. Rather than discussing and comparing such alternatives, the entire alternatives discussion in the DEIS/R centers on various combinations of airside "improvements" and the no-build alternative. It neglects true alternatives to the Project. Two such alternatives involve other airports. There is no discussion in the DEIS/R about a second major airport. Given the ground access and other constraints confronting Logan, a second airport is clearly an option that is worth consideration.	Comment noted.
61.41	Regional Transportation	Regional Airports	Another airport alternative ignored by the DEIS/R is Hanscom Field. This facility is owned by Massport, has adequate runways, is convenient to Boston and is underutilized. The DEIS/R does not explore the possibility of opening up Hanscom to commercial passenger and/or freight traffic. It does not discuss the fact that Federal Express once operated out of Hanscom or that the Hanscom Master Plan, agreed to by the surrounding towns, allows for an increase in operations over the current level. It also fails to acknowledge that many of the so-called "operations" at Hanscom are "touch and go" training exercises where each "touch" and each "go" is considered a separate operation, thus greatly inflating the operational level at Hanscom.	Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established policy (60-seat regulation), it believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR), its Annual Updates, and applicable regulatory limitations, and shall be considered by the Hanscom Field Advisory Committee. Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The environmental impacts of commercial services at Hanscom Field are summarized from the HGEIR and appear in Appendix B of the Supplemental DEIS/FEIR.
61.42	Alternatives	Taxiway Improvements	Another alternative is that of stopping the proposed centerfield taxiway at Runway 15/33. This alternative would greatly reduce taxiway noise and pollution for Winthrop residents. It is not even mentioned in the DEIS/R.	Most of the delay reduction and environmental benefits are a result of the availability of the north end of the Centerfield Taxiway.

Code	Topic 1	Topic 2	Comment	Response
61.43	Regional Transportation	Passenger Rail	The DEIS/R should explore real participation by Massport in promoting projects like high speed rail and the NSRL (North-South Rail Link), including the expenditure of funds.	Massport has actively encouraged regional transportation alternatives to Logan Airport, including rail. Massport supports intercity rail planning through its membership in the Boston Metropolitan Planning Organization (MPO). The MPO is a cooperative planning board whose membership also includes MassHighway, Metropolitan Area Planning Council; MBTA, and MBTA Advisory Board. As members of the MPO, Massport and these agencies are responsible for preparing the *Boston Transportation Improvement Program (TIP)* and the *Transportation Plan for the Boston Region.* In this capacity, Massport influences regional transportation plans for intercity rail. Massport also holds a seat on the Citizens Advisory Committee (CAC) of the MBTA's North-South Rail Link Project. The CAC met monthly and provided a forum for Massport and the MBTA to coordinate their ridership estimates and assessments of the relationship of the North-South Rail Link on airport access and airport usage. To date, the North-South Rail Link Project has not received funding and will not impact Logan Airport over the study time frame. Should the North-South Rail Link be constructed, resulting passenger diversions from Logan Airport to rail could reach 46,700 annual passengers, or less than one-half of one percent of Logan Airport's total annual traffic.
61.44	Noise	Model	California and many European countries utilize the Community Noise Equivalent Level ("CNEL") instead of the DNL. The DSEIS/R should present CNEL data.	There is no regulatory or scope requirement to provide CNEL contours in Massachusetts. Furthermore, CNEL values for an airport usually differ from DNL values by only a few tenths of a decibel. The metric would not lead to any different conclusions than those drawn here using DNL.
61.45	Noise	Nighttime Noise	Massport and FAA refuse to even consider applying for curfews under the Airport Noise and Capacity Act of 1990. While such an application may be fraught with difficulty, it is still legally available and thus still a reasonable alternative.	The FAA has stated that it does not intend to grant curfew regulations of Stage 3 aircraft. Therefore, such a regulation has not been proposed as a mitigation action in this study.

Code	Topic 1	Topic 2	Comment	Response
61.46	Environmental Review Process	MEPA	The MEPA regulations require the DEIS/R to contain Section 61 findings. The document 56-46 does not meet this requirement. Mitigation commitments are sorely lacking.	Refer to the Proposed Section 61 Findings in Section 8.7 of the Supplemental DEIS/FEIR. Chapter 8 of the Supplemental DEIS/FEIR summarizes Massport's proposed project-specific mitigation program associated with the Preferred Alternative including: Runway 14/32 would be designed, constructed, and operated to handle over-water operations only (unidirectional). Massport would seek to construct Runway 14/32 to reflect unidirectional use. To the extent that federal regulations permit and that funding is available, the proposed sound insulation program will include: (i) not only all residences that fall within the Preferred Alternative's 65 dB Day-Night Sound Level contour when compared to the Airside Project's No Action Alternative's 65 dB Day-Night Sound Level contour, and also (ii) Massport and the FAA will continue to sound insulate and work to complete the current 2-year sound insulation program as presented in the *Logan Airport 1999 ESPR R.* For the eligible residences, the FAA will fund building code upgrades, to the extent necessary, to implement sound insulation improvements. Relocation assistance will be provided to eligible tenants of Cargo Building 60. The potential loss of Upland Sandpiper habitat will be mitigated by altering airfield mowing procedures, implementing an on-airfield reconnaissance program and restoring off-site habitat. During the construction period an extensive array of traffic, air quality and noise mitigation measures will be employed to mitigate temporary construction impacts. Since the publication of the Airside Project Draft EIS/EIR, Massport is proposing the following additional mitigation measure: A PRAS monitoring system to gather data and report on the actual achievement of PRAS. The objective of this system is to improve the achievement of the PRAS goals and to provide a broader platform for disseminating of the monitoring results. While not related to the Airside Project, Massport is proposing the following initiative: Should the passenger activity level require it, Massport will identify a conceptual small community exemption program for PPP that will reduce the expected degree of service disruption without undermining the PPP Program's delay reduction benefits, and that could be incorporated as part of any PPP regulations come into effect in the future. Massport is actively involved in many air quality initiatives and explored other options to reduce emissions from activities at Logan Airport in the *Logan Airport 1999 ESPR* (previously GEIR).
61.47	Noise	Sound Insulation	...soundproofing is not adequate mitigation. It is a "band aid" approach which is completely ineffective for much of the year and totally ineffective outside of a soundproofed building. Yet, the DEIS/R notes repeatedly that soundproofing is the mitigation answer to all noise problems.	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update.* Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
61.48	Ecosystems	Endangered Species	Massport has had years to deal with the Upland Sandpiper habitat problem. Instead of coming up with a plan for mitigation that can be reviewed in the DEIS/R, the document just notes that Massport is working with another state agency to develop options. That is not good enough.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport from construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far exceeding the ±40 acres to be lost at Logan Airport. In the event that such a program at Camp Edwards is not available, an appropriate alternative program acceptable to the NHESP will be developed and implemented. Additional details of the Upland Sandpiper mitigation plan are presented in Section 6.5 of the Supplemental DEIS/FEIR.
61.49	Alternatives	Runway 14/32	The DEIS/R assumes that Runway 14/32 will be "unidirectional" only. However, it does not provide any detailed discussion as to how that restriction will be put in place and maintained over time. Indeed, the DEIS/R simply recites that FAA "policy" will keep 14/32 unidirectional.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. We anticipate that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.

PRESENTED TO THE MASSACHUSETTS ENVIRONMENTAL PROTECTION AGENCY (MEPA) ON APRIL 7, 1999 AND APRIL 8, 1999

This has become the year that Massport is finally being held to account by the communities. The objections to Massports inadequate proposal are growing and spreading almost uncontrollably. Congressman, Michael Capuano, Mayor Thomas Menino, Representative Robert Deleo, Senator Robert Travaglini and many of their fellow representatives and senators, Chelsea City Council, Board of Selectmen, Town of Winthrop, just to name a few are forcefully against the construction of runway 14/32, and other projects. These projects may temporarily provide a small decrease in the delays in air traffic at Logan Airport, but they will increase the number of flights per hour per day, and the environmental degradation that goes with those flights. If you had attended meetings on airport issues in Winthrop, Chelsea, Revere, Jamaica Plain, Hyde Park, South Boston, Roxbury, Melrose, East Boston and Charlestown, you would have been impressed by the expressed outrage and indignation at these Massport Proposals. 62.1

You may ask yourself why is Massport causing an uproar and strenuous objections by many of the leaders and communities who were silent in 1997? It is somewhat surprising that the communities of Winthrop, East Boston and South Boston are opposing these plans, when Massport has projected thirty to forty (30% - 40%) percent decrease in noise in these areas. Many of you have been promised less air pollution from the contaminants generated by the operations of Loan International Airport.

The answer is simple. The citizens of all of these communities finally understand that Massport can not be believed; that any relief promised by Massport would simply be short term if at all. Eventually, these communities that have been promised relief will be subjected to even a higher level of noise by the year 2010, than these communities are experiencing today. 62.2

I am going to refer you to Massports draft Environmental Impact Statement/Report, Table 4.5-1, P 4-29: you will note that if Massport is allowed it's preferred alternative 1A (which encompasses the construction of runway 14/32 construction of center field taxi way and reducing the approaching minimums of runway 62.3

15R, 22L, 27 and 33L,) the flight delays will increase from 168,000 to 236,000 per year by 2010. In in 1999, Massport projects flight delays of only 126,500. So things are not going to get better at Logan even with the new runway.

The increase of passengers at Logan in the year 2010 will increase by approximately 42%. I suggest gentlemen that you try to visualize the increase in the amount of cars and trucks on the Massachusetts Turnpike, Southeast Expressway and the tunnels, during rush hour. Massport plans indicate one major and obvious error.... It has failed to plan for growth! 62.4

If you review the history of Massport, and the web of political intrigue, that has been spun by Massport and certain political leaders, the issue of expansion has taken on the appearance of a social and economic spin-off. In 1990-1991, James King, now a presidential fellow at Trinity College, was then Chairman of the Mass Aeronautics Commission, who studied sites for a second major airport. He recommended that serious consideration be given to the Fort Devens Site. However, Governor Weld removed that consideration completely from the table. I am referring to a Globe article, March 17, 1999. Secretary of Transportation of he Commonwealth, Fred Salvucci has admitted that he and then Governor Dukaisis promised the residences of East Boston that they would be no further expansion at Logan International Airport. (Also Globe, 3/17/99)

There has been no consideration or studies directed at expanding Hanscom Airfield in Bedford, which has two existing lengthy runways. A commitment from Massport to focus its energies and funding to improving the cargo and terminal facilities at Hanscom would help their cause far greater than the short term of runway 14/32 at Logan. Massport will admit, if confronted, that the expansion at Hanscom would be a political nightmare. A recent article in the Globe regarding a meeting that Governor Celluci granted to a selectman from the Town of Lexington, as you know, Lexington is adjacent to Hanscom. The governor was quoted as stating to the selectman that he certainly would not support an airport or expansion in an area where the residents "did not want it" Governor Celluci has not responded to the January 25, 1999 request by the residents of the Town of Winthrop for a meeting on the airport issues, and he probably will not respond. We do not want it. Governor Cellucci, are we a lesser class of citizens than those from lexington well-heeled suburbs? FAA, are you complying with your environmental justice requirements? 62.5 62.6

Massport has failed to take into consideration the updating and modernizing of either Worcester Municpal Airport, or New Bedford. For years, we have urged Massport to work on the Worcester Airport development, but we were told that Massport has no authority, Yet Peter Blute, the CEO at Massport was quoted in the Herald issue of 62.7

March 16, 1999 that "Massport is in the process of taking over the operation of Worcester Airport." What does this mean? Why was it not done years ago?

Rather than Massport facing reality, in developing these regional airports and also laying the foundation for a second major airport after the year 2010, it commits itself to spending $200,000 in an ad campaign in order to "sell" runway 14/32. A substantial portion of those funds are ours, the taxpayer monies!

Massport has done very little, in actively promoting construction of the North/South Station link (except to attend meetings). In November of 1999, Amtrak will begin a regular schedule of high speed trains traveling at 150 miles per hour reaching Penn Station, in New York in approximately 3 hours. A North/South Station link would open up high speed rail travel to all commuter lines running into North Station, the Woburn Regional Transportation Center and Northern New England and would divert a substantial number of air travelers to rail travelers. 62.8

Finally, I would like to address the issue of the economic effect of concentrating on regional airports. In the Boston Business Journal of March 19, 1999, Paul Guzzi, the CEO of the Boston Chamber of Commerce stated that the New Runway is "good for the economy and it is good for jobs". Is he implying that utilization of regional airports will cause a decline in the greater Boston economy? I believe that to be an improper statement. First of all, the airlines, internally are one of the major causes of delays. If instead of utilizing smaller aircraft on a more frequent basis they used larger planes on an infrequent basis, there would be substantial decrease in the noise. More importantly, people will still come to Boston with or without the construction of runway 14/32. Massport has admitted that in its statement. Hanscom's airfield is approximately 15 mil from Boston. With proper link into the Massachusetts Turnpike, Worcester would be within a reasonable distance from Boston. These regional airports would maintain and improve the Boston economy, as well as, provide the same number of jobs if not more as would the current Massport expansion plan. 62.9

In closing, I would like to quote sections from former Governor William Weld's executive order number 385, in the fifth paragraph he states "whereas in the absence of the effective growth management, the burden of balancing economic development with resource protection is not spread equitably, but falls disproportionately on proponents on the most recent development, as well as, on **communities lacking sufficient means to protect their resources and guide the development." (emphasis added).** He then went on to issue several orders under "declaration of policy". In section 3, he ordered all State Agencies, Departments, Boards, Commissions, Authorities and instrumentality's of the Commonwealth (hereafter "agencies") shall evaluate the effect of their current regulations, 62.10

policies, plans, and practices on their and others' ability to facilitate sustainable economic development and to **preserve environmental quality and resources**, and shall adopt changes to the extent necessary to effectively contribute to the attainment of these objectives; provided that no such change shall infringe on the jurisdiction or authority of municipal, county, regional or Federal Government.

Massport has failed to preserve environmental quality, and resources. I urge you to find the Massport Environmental Impact Statement/Report **Inadequate**.

Respectfully Submitted,

Jerome E Falbo

JEROME E. FALBO, CHAIRMAN

Letter 62
Town of Winthrop, Noise, Air Pollution and Airport Hazards Committee
Jerome E. Falbo

Code	Topic 1	Topic 2	Comment	Response
62.1	Alternatives	Runway 14/32	...[T]he construction of Runway 14/32, and other projects. ...may temporarily provide a small decrease in the delays in air traffic at Logan Airport but they will increase the number of flights per hour per day, and the environmental degradation that goes with those flights.	Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts. Projected changes in flight patterns and associated noise shifts are consistent with the PRAS goals, which were studied and approved by the community when established. Activity increases over certain communities are offset by activity reductions over other severely impacted communities and by activity increases over water.
62.2	Alternatives	Runway 14/32	...[T]he communities that have been promised relief will be subjected to even a higher level of noise by the year 2010, than these communities are experiencing today.	In 1998, 77 percent of Logan Airport's jet traffic affected communities to the north and south of the airport—East Boston, Winthrop, Revere, parts of South Boston, Dorchester, Quincy, Milton, and Braintree. Without Runway 14/32, as much as 88 percent of Logan Airport's aircraft operations will overfly these communities when Logan Airport reaches 37.5 million passengers. Construction of Runway 14/32 will allow a more balanced geographic distribution of aircraft operations over populated areas, will increase the number of over-water operations, and will reduce noise exposure for close-in communities. In fact, the most heavily impacted communities will experience a decrease in overflights compared to 1998 levels. With the Preferred Alternative, when Logan Airport reaches 29 million passengers, overflights from Runway 4 arrivals and Runway 22 departures, which affect South Boston, Quincy, Milton, and Braintree, will decrease from 107,861 in 1998 to 58,305 operations. Similarly, overflights affecting Winthrop (Runway 27 arrivals and Runway 9 departures) will decline from 88,224 in 1998 to 55,805. As a result of the relief for these communities, flights over the water and flights over less impacted communities will increase.

Code	Topic 1	Topic 2	Comment	Response
62.3	Alternatives	Preferred Alternative	[With] Alternative I A (which encompasses the construction of Runway 14/32[,] construction of center field taxi way and reducing the approaching minimums of runway 15R, 22L, 27 and 33L,) flight delays will increase from 168,000 to 236,000 per year by 2010. In 1999, Massport projects flight delays of only 126,500. So things are not going to get better at Logan even with the new runway.	Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts.
62.4	Ground Transportation	Access to Logan	The increase of passengers at Logan in the year 2010 will increase by approximately 42%. ...Visualize the increase in the amount of cars and trucks on the Massachusetts Turnpike, Southeast Expressway and the tunnels, during rush hour. Massport ...has failed to plan for growth!	Implementation of the Preferred Alternative would not increase capacity, but rather it would correct a series of deficiencies in the airfield geometry and operation. Massport's plans to handle the ground access requirements of future passenger levels are discussed in the *Logan Airport 1999 ESPR* (previously GEIR) and its subsequent Environmental Data Reports (Annual Updates). Massport is constantly striving to make Logan Airport a more efficient transportation center with less impact on surrounding communities by improving mass transit access to Logan Airport. The Airside Project makes Logan Airport more efficient and will not affect vehicle traffic, transit systems or major roadway intersections. The Supplemental DEIS/FEIR discusses all the environmental impacts from the Airside Project. The ESPR/GEIR and its Annual Updates discuss Massport's efforts to lessen Logan Airport's total environmental footprint, especially impacts from ground access. Finally, with regard to caps on airport operations, federal constitutional provisions (preemption, commerce clause, equal protection), federal aviation statutes and regulations, and contractual provisions related to covenants in connection with the federal Airport Improvement Program grants which Massport receives, restrict Massport's ability to control the number of aircraft operations at Logan Airport. However, Massport has developed an action plan as described in Section 4.5 of the Supplemental DEIS/FEIR, designed to address overscheduling conditions at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
62.5	Regional Transportation	Regional Airports	There has been no consideration or studies directed at expanding Hanscom Airfield in Bedford, which has two existing lengthy runways. A commitment from Massport to focus its energies and funding to improving the cargo and terminal facilities at Hanscom would help their cause far greater than the short term of Runway 14/32 at Logan.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
62.6	Regional Transportation	Regional Airports	[Is the] FAA...complying with... [its] environmental justice requirements ...[by failing to seriously consider Hanscom]?	Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively. Refer to response to comment 62.5.

Code	Topic 1	Topic 2	Comment	Response
62.7	Regional Transportation	Regional Airports	Massport has failed to take into consideration the updating and modernizing of either Worcester Municipal Airport, or New Bedford.	Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. Since January 2000 Massport has attracted three new airlines to Worcester Regional Airport. Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta on February 1, 2000 and will be increasing its service to three daily flights in April 2001. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. In February 2001, PanAm began daily scheduled service from Worcester to Orlando International Airport. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition to the Worcester Regional Airport, Massport has pursued a variety of initiatives to promote the use of other regional airports and travel modes with the goal of relieving traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci co-sponsored a Regional Transportation Summit of the New England Governors and transportation officials. The Summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. A second summit was held in Rhode Island in December 2000. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives. Massport disagrees that its record in diverting traffic to other airports is unsuccessful. Since 1996 eight out of ten new passengers in New England were directed to regional airports, which include T.F. Green/Providence, Worcester Regional, and Manchester airports. In 1999, Massport estimates that regional airports attracted 2.4 million passengers, that would have otherwise used Logan Airport. PRAS was established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations. During very high demand periods, the controllers have little or no flexibility for runway selection. Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals by redirecting many flights to overwater routes. The addition of Runway 14/32 is the single most important mechanism to achieve equitable geographic distribution of aircraft operations and noise. Runway 14/32 and all other airside improvements would reduce current and future delays and enhance safety. The sooner that these improvements are implemented, the more long-term delay benefits will be realized.
62.8	Regional Transportation	Passenger Rail	Massport has done very little, in actively promoting construction of the North/South Station link (except to attend meetings)... A North/South Station link would open up high speed rail travel to all commuter lines running into North Station, the Woburn Regional Transportation Center and Northern New England and would divert a substantial number of air travelers to rail travelers.	The official estimate of passenger diversion from Logan Airport to the North/South Rail Link is 46,700 passengers in 2010, approximately 0.1 percent of Logan Airport's expected passenger traffic in 2010. Refer to Technical Report No. 4 Ridership Methodology and Forecasting Study of the North/South Rail Link Project (February 1998).

Code	Topic 1	Topic 2	Comment	Response
62.9	Regional Transportation	Regional Airports	Hanscom's airfield is approximately 15 mil[es] from Boston. With proper link into the Massachusetts Turnpike, Worcester would be within a reasonable distance from Boston. These regional airports would maintain and improve the Boston economy, as well as, provide the same number of jobs if not more as would the current Massport expansion plan.	Refer to response to comment 62.5. Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside projects at Logan Airport.
62.10	Environmental Review Process	MEPA	[Massport has failed to comply with] Governor William Weld's executive order number 385....	Massport disagrees with this assertion, as extensively described in Chapter 1 of the Supplemental DEIS/FEIR.

Logan Airside Improvements Planning Project EOEA #10458

Dear Mr. Durand,

The following comments are being submitted in response to the above Draft Environmental Impact Statement/Report (EIS/R). It is the opinion of the members of this committee that the Draft EIS/R does not adequately address very critical issues regarding the generation of airborne pollutants from the combustion of petrochemical fuels, and the effects of these environmental pollutants on the health of Winthrop residents. A considerable proportion of the residents of Winthrop are concerned about what they perceive to be a high incidence of respiratory disease and cancer, which they attribute to exposure to pollutants currently and historically generated by airport activities. In the current Draft EIS/R, Massport estimates (Vol IV, Tables E14-1 Through E14-4) indicate that, in 1999, airport related activity releases 50,000 pounds of toxic pollutants into the air daily.

63.1

The relationship between these pollutants and serious respiratory disease is well established in the literature. Considerable evidence exists for elevated levels of Asthma, and Respiratory Tract Cancer in both East Boston and South Boston. Winthrop, primarily a residential community located seaward of the airport, in the past has shown lesser health effects than these communities. However more recent reports (Massachusetts Disease Registry) show that we have now reached the incidence levels of Asthma of our neighbor communities. Lung Cancer levels in Winthrop (Massachusetts Cancer Registry), not in themselves excessive, consistently demonstrate a markedly increased rate for females, who in past years have constituted the at home exposed population. As these results become clearer, the wisdom of locating airports, generators of concentrated petrochemical combustion waste, in urban centers becomes very suspect.

While we are aware that the changes proposed in the Draft EIS/R indicate increased efficiency of operation of the airport, and project only slight change in the level of pollutants emitted, we strongly feel that the current levels are themselves creating a significant negative impact on the health and well being of Winthrop residents. We strongly oppose any development which will increase the operational capacity of Logan Airport until these adverse impacts and their relation to airport pollution generation have been thoroughly addressed. 63.1 (cont.)

We note that these issues concerning immediate and local impact were raised in public comments, and in the Secretary of Environmental Affairs Certification statement with regard to the Logan Airport GEIR annual update in 1996, EOEA # 3247. Massport was directed at that time to initiate such studies, but we have no knowledge that such activities were ever undertaken. Massport has instead relied on its participation in the State Implementation Program, and the projection of pollutant concentrations by EPA dispersion modeling techniques which indicate levels within the National Ambient Air Quality Standards. We would like to make the following points:

1. Accurate analysis of the public health impact of this localized pollution source requires that the data be gathered and analyzed for differential effects on local neighborhoods within the affected area, and this data be compared to meteorological dispersion of pollutants generated by airport activity. 63.2

2. Dispersion models which predict essentially no variation in concentration of pollutants throughout the Town of Winthrop, which has neighborhoods both a few hundred yards, and several miles from the generation source must be considered very suspect. The technology exists for the direct measurement and monitoring of these pollutants, and should be established without delay. 63.3

We feel that addressing these issues must be carried out before any actions are taken to further the development or operational capacity of this airport.

LETTER 64

Mr. Arthur Pugsley – EOEA No. 10458
Secretary of Environmental Affairs
Attention MEPA Office
100 Cambridge Street
20th Floor
Boston, MA 022025

Dear Mr. Pugsley:

The Aircraft Owners and Pilots Association (AOPA) represents the general aviation interests of more than 340,000 individual pilots and aircraft owners in the United States, more than 30,000 of whom reside in New England. AOPA and its members are very interested in any action that will enhance the access to and capacity of airports in New England and the efficiency of the air traffic control system.

For more than ten years, AOPA has been participating in the airside development issues at Boston-Logan International Airport. Recently we were provided the opportunity to review the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) entitled "Logan Airside Improvement Planning Project."

It is our assessment that reducing delays through new infrastructure, including runways, is the appropriate way to ensure that the Boston Metropolitan area will be able to meet the growing demand for air transportation in the 21st century without suffering significant environmental and economic consequences. Alternative 1A in the Draft EIS/EIR would enhance capacity by building runway 14/32 and a new centerline taxiway. This alternative also calls for improvements to additional taxiways and would address the approach minimums for runways at Logan.

Additionally, Alternative 1A provides solutions for the recognized needs of the users of Boston-Logan International Airport while minimizing and mitigating environmental impacts, including noise, on the surrounding communities. Alternative 1A not only protects but also enhances the socioeconomic benefits that Boston-Logan International Airport brings to the Boston Metropolitan area and New England as a whole. Alternative 1A would also reduce fuel-wasting delays and in many cases reduce noise, especially late at night, for the communities most severely impacted at the present time. 64.1

On behalf of our New England members, **AOPA fully supports Alternative 1A** and urges its timely implementation.

Should you require any additional information on this or any other related issue, please feel free to contact me at (301) 695-2221.

Sincerely,

Dennis Roberts
Vice President, Executive Director
Government and Technical Affairs

LETTER 65

April 16, 1999

Mr. John Silva
Manager, Environmental Programs
New England Region
Federal Aviation Administration,
12 New England Executive Park
Burlington, MA 01803

Re: Logan Airside Improvements Planning Project, Boston, MA
EOEA #10458

Dear Mr. Silva:

I am submitting the following comments on behalf of Airport Impact Relief, Inc. ("AIR, Inc.") in regard to the Draft Environmental Impact Statement/Report ("EIS/R") for the above project.

The Draft EIS/R does not adequately describe the environmental and socio-economic impacts of the project and evaluate other reasonable alternatives to the proposal chosen by Massport as its preferred alternative. Furthermore, to the extent this document has been circulated to comply with the requirements of Federal law, the Draft EIS/R shows that the Federal Aviation Administration has not properly carried out its own obligations under relevant provisions of Title 49 of the United States Code, the National Environmental Policy Act ("NEPA") and its implementing regulations, and the requirements of Executive Order 12898 and the DOT Order regarding environmental justice.

1. Federal statutory context. Massport's proposal to construct a new Runway 14/32 and other airfield improvements at Logan Airport will trigger a number of FAA and Secretary of Transportation approvals and/or actions with respect to a future grant application, changes to the Logan airport layout plan, airspace determinations, and related actions. Accordingly, this Draft EIS/R should reflect the strong Federal presence in the project, discuss the Federal policies and future Federal approvals which will be necessary, and provide a documented record of how the FAA has carried or will carry out its obligations under Federal law with regard to this project. The Draft EIS/R falls far short in providing this information to the public. 65.1

For example, the brief reference in Table 8.8-1 on pages 8-27 and 8-28 of the need for FAA "Federal funding approval" and a "Section 4(F) Determination" from the U.S. Department of Transportation, and the actual Section 4(f) discussion on pages 8-18 to 8-21, totally fail to provide the reader with a fair understanding of the important requirements of Federal law with respect to the approval of airport development projects. In fact, the only provision of Title 49 of the United States Code which is reproduced in the document is Section 40103, a provision which concerns FAA authority to regulate use of airspace, a fact which is not in dispute. On the other hand, other than one cryptic reference to the pubic hearing requirement of "49 USC 47106(c)" on page P-3 of the Draft EIS/R, this document does not summarize the relevant provisions of Federal law and policies contained in 49 U.S.C. § 47101 et seq. which have been enacted to ensure that airport development projects are consistent with the needs of the surrounding communities and protect the environment.

It is not generally understood by the many citizens who are impacted by the present, and proposed future, operations of Logan Airport that it is the policy of the United States that airport development projects should minimize, rather than increase, projected noise impacts on nearby communities (49 U.S.C. § 47101(a)(2)) and provide for the protection and enhancement of the quality of the environment (49 U.S.C. § 47101(a)(6)); that mitigation of existing noise impacts must be given a high priority in airport development projects which expand capacity (49 U.S.C. § 47101(c)); and that airport development projects should be planned in a cooperation effort with state and local officials (49 U.S.C. § 47101(g)(1)). None of these policies are alluded to in the Draft EIS/R. 65.2

These general policies are then reinforced by the more specific provisions of 49 U.S. C. § 47106 which ensure that airport development projects do not have significant adverse impacts on the surrounding region. For example, a project grant application may be approved by the Secretary of Transportation *only if* he is satisfied that "the interests of the community in or near which the project may be located have been given fair consideration ...." Second, 49 U.S.C. § 47106(c)(1)(A)(ii) gives the City of Boston, where the Massport airfield improvement project will be located, the right to petition the Secretary of Transportation about this project since the Massport Board does not have any voting representation from Boston, a right which is not discussed in the Draft EIS/R. Third, under 49 U.S.C. § 47106(c)(1)(A) the Secretary of Transportation may not approve the runway unless a public hearing is held to consider whether the runway is consistent with the community's planning objectives, as well as the economic, social and environmental effects of the runway. The public hearings held last week did not make this fact clear to the public. Finally, 49 U.S.C. § 47106(c)(C) prohibits approval of the project if it has significant adverse effects on natural resources (including recreation assets) unless there is no possible and prudent alternative and every reasonable step has been taken to minimize the adverse effects of the project. 65.3

The Draft EIS/R does not show that any cooperative planning efforts were made by Massport with the City of Boston and other local communities regarding which of the alternatives should be

selected by Massport as its preferred alternative. In fact, Massport repeatedly refused over an 18-month period to consult with the Community Advisory Committee about its choice of a preferred alternative. As you know, in October of 1997 AIR, Inc. specifically requested, in the enclosed letter to Massport Executive Director Peter Blute, an opportunity "to start the process of discussion" concerning airside improvements at Logan. This letter was never responded to by Mr. Blute or by anyone else at Massport or the FAA, to whom a copy was sent. Neither Massport nor the FAA consulted with the affected communities as to whether the selection of Alternative 1A would be consistent with the requirements of Federal law, particularly regarding minimization of noise and avoidance of disproportionate impacts to minority and low income communities. 65.4

Accordingly, we believe that it would be impossible for the Secretary of Transportation to be satisfied that "fair consideration" has been given to the interests of the surrounding communities when other alternatives, such as an aggressive peak period pricing program or further development of other existing commercial airfields, and Massport's own Hanscom Field, were not even evaluated. Furthermore, as documented in the comments of the Community Advisory Committee (CAC) dated March 29, 1999, which comments are endorsed and adopted by AIR, Inc., the project – particularly the proposed Runway 14/32 – will have excessive noise and other impacts on surrounding communities, in conflict with the national policy established in 49 U.S.C. § 47101(a) and (c). 65.5 65.6 65.7

One other area of particular concern to AIR, Inc. is the document's failure to make a meaningful evaluation, as required by Federal law (including 49 U.S.C. § 47106(c)((1)(C)), of the impacts of the project on Section 4(f) resources. The document's apparent status as a "Draft Section 4(f) Statement" as well as a Draft EIS/R is not really made clear except on the page following REV-32 entitled "List of Preparers" at the end of volume I. The Preface (page P-1) and the discussion of the MEPA/NEPA Process and the Massport - FAA Roles on pages P-2 to P-5 do not indicate that the document is being circulated for comment as a Draft Section 4(f) Statement. The references at the top of each page and the Table of Contents to "Draft 4(f)" are confusing and not explained in the text. 65.8

The actual discussion of potential Section 4(f) impacts on pages 8-18 to 8-21 of the Draft EIS/R does not present sufficient data which shows the actual effects of the proposed project on the two historic sites identified in Chelsea. The bare determination by the FAA "that there are no feasible or prudent alternatives to the Preferred Alternative which would achieve the delay reduction, safety, transportation, noise distribution and other objectives of the Preferred Alternative" (page 8-21) is so conclusory as to be meaningless. 65.9

2. Environmental justice compliance. The draft EIS/EIR reflects significant, and fatal, short-comings in the FAA's ascertainment and evaluation of the impacts of this project on minority and low-income populations living adjacent to the project. The document shows that the FAA did not actively obtain the population and impact information required by the Executive Order and the DOT Order; the only specific data presented is noise data, which compares the projected noise

impacts (which we believe are significantly understated) in particular communities to the study area as a whole, rather than showing the discrepancies among and between various communities which are impacted by the project; and other impacts, such as the impacts from air pollutants and odor, are not addressed. At best, the environmental justice information is presented in a way which suggests the FAA was simply "checking off" this requirement rather than attempting, in good faith, to provide a meaningful evaluation of the project on minority and low-income communities. 65.10

3. **Preferential runway advisory system (PRAS).** In Chapter 8 of the Draft EIS/R, Massport and the FAA maintain that the preferred alternative selected by Massport will help to obtain a better achievement of the goals of PRAS. In our opinion, however, that justification is misplaced. PRAS has not been a useful and reliable mechanism for equitable distribution of noise impacts for many years, due to increased volumes of air traffic and other historic and operational reasons. Achievement of the PRAS goals is not a relevant criterion for this project. If anything, the PRAS goals need to be revisited and understood by the public before any decisions should be made based upon PRAS. 65.11

4. Conclusion. AIR, Inc. respectfully requests that the Draft EIS/R be found inadequate by the Secretary of Environmental Affairs for all of the reasons stated above and in the comments of the CAC; that the FAA should reconsider its support for the project in light of the many deficiencies noted in the Draft EIS/R; and that the document should be withdrawn from further pubic consideration or processing at this time pending the development of a meaningful participatory process for evaluation of alternatives to the Runway 14/32 proposal. 65.12

Sincerely yours,

Peter L. Koff

Re: Peak period pricing and airside improvements

Dear Peter:

Airport Impact Relief, Inc. has asked that I write to you regarding the issues of peak period pricing and airside improvements, issues which have been made even more important by yesterday's *Wall Street Journal* story and your message in this week's *East Boston Sun Transcript*.

We are concerned by the lack of information which is being provided to us regarding the nature and timing of Massport's plans with respect to peak pricing. I gather from the *Journal* piece and other information I have heard that Massport has decided to move forward, together and at the same time, with peak period pricing and airside improvements (including Runway 14/32 and a centerfield taxiway), and that a Draft EIR will be published next month. I do not know if this information is accurate, but it would certainly be helpful to the community if some specific timetable was communicated as to when and what Massport proposes to do. Of course, I am surprised if the Massport plan would have a runway element going forward at the same time as the initiation of peak pricing. It had been our understanding that you were in agreement about "giving 'peak' a chance."

In another ironic twist to this issue, I was today called by someone in the Hanscom area asking whether Massport would be subject to local zoning requirements relative to a possible golf course and non-aviation development plans for Hanscom. The possibility that Massport would be giving up airport uses at Hanscom -- while it simultaneously moves to expand Logan's "operational flexibility" and ability to accommodate increased numbers of small and commuter aircraft using Logan -- is most troubling to us. The people of East Boston and Winthrop have always been sensitive to not shifting the problems of Logan Airport to the Hanscom area communities of Lexington, Concord, Bedford, and Lincoln. But at the same time, as long as Logan Airport growth is being discussed and Massport is considering options which we believe would increase the use of and impacts generated

by Logan Airport, it is only fair and necessary for other alternatives to be explored and equally considered by your agency. Therefore, I would expect to see in any EIR for airside development at Logan a rigorous analysis of options for use of Hanscom, as well as the possibilities of a slot system and other demand management techniques for Logan, even if some of these would require FAA implementation. I am curious whether this kind of information will be available in your EIR and what studies have taken place regarding these various alternatives.

Your message in the *Sun Transcript* stated that you were committed to proceeding in good faith and in a spirit of cooperation to work with the Airport's neighbors to resolve difficult issues to the satisfaction of all concerned. I suggest that the difficult issues of peak period pricing, airside improvements, and alternatives to physical construction at Logan Airport should now be at the top of your list for discussion with the community. As one group which has a key role to play in these issues, we would like to start the process of discussion. If you would call me directly or ask Scott Kafker or another member of your staff to do so, we could hopefully agree upon the right way for this discussion to proceed.

I look forward to hearing from you.

Sincerely yours,

Peter L. Koff

65.1	Environmental Review Process	FAA/NEPA	...[T]his Draft EIS/R should ... discuss the Federal policies and future Federal approvals which will be necessary... with regard to this project.	Chapter 1 of this SDEIS/FEIR describes the Federal process undertaken for this project. Chapter 8 of the Supplemental DEIS/FEIR describes the federal permits and approvals required for the Preferred Alternative.
65.2	Environmental Review Process	FAA/NEPA	General policies enacted in 49 U.S.C. § 47101 are not alluded to in the Draft EIS/R.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR comply with applicable requirements of federal law.
65.3	Environmental Review Process	FAA/NEPA	The Public Hearing did not make clear to the public the requirements of 49 U.S.C. § 47106.	FAA statements at the commencement of the public hearing addressed pertinent requirements of 49 U.S.C. § 47106.

Code	Topic 1	Topic 2	Comment	Response
65.4	Environmental Review Process	Public Process	The Draft EIS/R does not show that any cooperative planning efforts were made by Massport with the City of Boston and other local communities regarding which of the alternatives should be selected by Massport as its preferred alternative...Neither Massport nor the FAA consulted with the affected communities as to whether the selection of Alternative 1A would be consistent with the requirements of Federal law, particularly regarding minimization of noise and avoidance of disproportionate impacts to minority and low-income communities.	There was an extensive public participation and review process during the preparation of the Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. Low income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order r, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. The data presented are based on the most recently available census data (1990) using Geographic Information System (GIS) technology to analyze impacts at the most detailed level possible. Refer to Sections 6.8.3 and 6.8.5 of the Supplemental DEIS/FEIR for a discussion of the analytical methodology and results, respectively.
65.5	Alternatives	Peak Period Pricing	Other alternatives ... such as an aggressive peak period were not evaluated.	The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. Analysis of PPP is set out in in Section 4.5 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
65.6	Regional Transportation	Regional Airports	... further development of other existing commercial airfields, and Massport's own Hanscom Field, were not even evaluated.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. The role of other commercial airports in New England is discussed in Chapter 2 of the Supplemental DEIS/FEIR.
65.7	Alternatives	Runway 14/32	... the proposed Runway 14/32 will have excessive noise and other impacts on surrounding communities, in conflict with the national policy ...	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.
65.8	Open Space/ Parkland	Section 4(f)	The document fails to make a meaningful evaluation ... of the impacts of the project on Section 4(f) resources. The document's apparent status as a "Draft Section 4(f) Statement" as well as a Draft EIS/R is not really made clear ...	Section 4(f) requires the identification of resources that would be used by any alternative under consideration. Therefore, the identification of all park and historic resources currently affected by Logan Airport is not required for a Section 4(f) Evaluation. There are no parklands, historic properties or sites, or other Section 4(f) resources on the airfield in the area of the proposed runway and taxiway improvements. There are also no parklands identified in those areas where the 65 dB DNL contour for the Preferred Alternative extends beyond the 65 dB DNL contour for the No Action Alternative (Alternative 4). Therefore, the Preferred Alternative will have no direct or indirect impact on parklands. Refer to Sections 5.3 and 6.3 of the Supplemental DEIS/FEIR for a discussion of parklands relative to the Preferred Alternative.

Code	Topic 1	Topic 2	Comment	Response
65.9	Open Space/ Parkland	Section 4(f)	... discussion of potential Section 4(f) impacts ... does not present sufficient data which shows the actual effects of the proposed project on the two historic sites identified in Chelsea. The bare determination by the FAA "that there are no feasible or prudent alternatives to the Preferred Alternative which would achieve the delay reduction, safety, transportation, noise distribution and other objectives of the Preferred Alternative" is so conclusory as to be meaningless.	Refer to response to Comment 65.8.
65.10	Environmental Justice	Impacts	... the environmental justice information is presented in a way which suggests the FAA was simply "checking off" this requirement rather than attempting, in good faith, to provide a meaningful evaluation of the project on minority and low-income communities.	The Environmental Justice analysis was significantly expanded in Section 6.8 of the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on Environmental Justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations from the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. Mitigation of the increased noise within the 65 dB DNL noise contour will be provided to affected communities in the form of residential sound insulation.
65.11	Noise	PRAS	Achievement of the PRAS goals is not a relevant criterion for this project.	Since the PRAS goals were developed in conjunction with Massport, the FAA, and neighboring communities, it has been Massport's policy to encourage the FAA to operate Logan Airport in a manner that would attempt to fulfill the PRAS goals. The use of the PRAS goals in this study is consistent with this policy.

Code	Topic 1	Topic 2	Comment	Response
65.12	Environmental Review Process	Public Process	... the document should be withdrawn from further public consideration ... pending the development of a meaningful participatory process for evaluation of alternatives to the Runway 14/32 proposal.	There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Airside Project Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Airside Project Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

LETTER 66

April 24, 1999

Bob Durand, Secretary
Executive Office of Environmental Affairs
100 Cambridge Street
Boston, MA 02202
Attn: Arthur Pugsley

Re: Logan Airside Improvements Planning Project, Boston, MA
EOEA #10458

Dear Mr. Durand:

I am submitting the following supplemental comments on behalf of Airport Impact Relief, Inc. ("AIR, Inc.") in regard to the Draft Environmental Impact Statement/Report ("EIS/R") for the above project. I am hopeful that you will be able to accept these late comments which were delayed by my being out-of-town all of this past week.

First, I want to include one general observation about the lack of adequate maps and figures to identify the particular residential communities surrounding the Airport which would be impacted (positively or negatively) by the projects which Massport is proposing. The document repeatedly shows the Logan Airport facilities only to the extent of the Airport's property boundaries but without reference to the surrounding land areas and residential communities which lie next to or just beyond the surrounding waters. See, for example, the following figures: Figure 1.5-1 (existing runway layout) on page 1-15; Figures 1.5-2 through 1.5-6 (runway usage in various wind configurations) on pages 1-16 through 1-20; and the noise contours in Volume IV. These graphics minimize the impacts of the proposed projects on the persons who reside close to the Airport and make it more difficult for individuals to understand the potential effects of the projects on their particular neighborhoods. Figure 5.1-1 on page 5-4 does show the Airport in relation to the surrounding communities, but the areas are identified only generally ("East Boston," "Winthrop," and so forth) without more specific identifications of the particular neighborhoods. In contrast, Figure 5.3-2 on page 5-56, which shows the locations of air quality modeling receptors, does properly identify specific neighborhoods within Winthrop and East Boston, and South Boston. More extended use of these particular identifications would be helpful throughout the document.

66.1

Second, our original comment letter dated April 16, 1999 neglected to comment upon two of the specific projects, in addition to the proposed Runway 14/32, which are of concern to AIR, Inc. and its members. The evaluation in the Draft EIS/R of the proposed Centerfield Taxiway does not adequately discuss the environmental impacts (both noise and odors) of this project, its relationship to increased Airport capacity (augmenting gate shortages) and expanded use of the airfield, and alternatives to the full Centerfield Taxiway, including constructing a shorter taxiway in the southern half of the airfield which would avoid adding more taxiing and queuing of aircraft in close proximity to the Bayswater/Constitution Beach area of East Boston and the Court Road neighborhood in Winthrop. 66.2 66.3

Finally, the discussion in the Draft EIS/R regarding lowering of the landing minimums on Runways 15R, 33L, 22L, and 27 is very limited and far from adequate. The Draft EIS/R does not fully disclose and properly evaluate the present conditions which limit lowering of the landing minimums on, we believe, three of the four runway ends. AIR, Inc. previously obtained from Massport, by means of a public documents request, a copy of the July 31, 1980 Agreement between Massport, the FAA, and the City of Boston regarding the installation of various lighting and instrumentation at the end of Runway 15R. In this Agreement the FAA states that it does not intend to lower landing minimums on Runway 15R, and will not do so in the future without a full environmental impact statement and public meetings. The Agreement references similar restrictions regarding lowering of the landing minimums on Runways 22L and 27. 66.4

The Draft EIS/R has no specific text discussion about this Agreement or the reasons particularly applicable to Runway 15R in the Draft EIS/R main volume (Volume I, pages 3-36 to 3-38) or Appendix D (Volume III). Based on the actual text of the Agreement for Runway 15R, and assuming the agreements for Runway 22L and 27 use similar language, the Draft EIS/R completely misstates the purpose of the agreements regarding these three runways when the Draft EIS/R states that when the instrument landing system equipment was installed on these runways "several years ago" the FAA "agreed to temporarily retain the existing approach minimums ...." See Volume I, page 3-38; Volume III, Appendix D, page 1. The EIS/R should provide, but does not, a full discussion of the reasons for the agreements, the concerns of residents who live close to the approach ends of these runways, the perceived and actual potential impacts of the proposed changes, alternatives, and appropriate mitigation.

AIR, Inc. respectfully requests that the Draft EIS/R be found inadequate by the Secretary of Environmental Affairs for the reasons stated above and in our previous comments.

Sincerely yours,

Peter L. Koff

cc: John Silva, FAA
AIR Inc. members

Letter 66
Airport Impact Relief, Inc. (McGowan, Engel, Tucker & Schultz)

Code	Topic 1	Topic 2	Comment	Response
66.1	Noise	Studies	Requests more extensive use of maps in identifying specific neighborhoods and to show relationship of surrounding communities to Logan on maps and figures.	Refer to the new graphics in Chapters 4, 5 and 6 of the Supplemental DEIS/FEIR.
66.2	Alternatives	Taxiway Improvements	The evaluation in the Draft EIS/R of the proposed Centerfield Taxiway does not adequately discuss the environmental impacts (both noise and odors) of this project, ...	Section 6.2 of the Supplemental DEIS/FEIR shows that there are small noise benefits from the construction of the Centerfield Taxiway. The principal effect of the Centerfield Taxiway is to reduce the number of aircraft waiting on the taxiways reducing ground noise and emissions for close in residents of East Boston and Winthrop. It also should eliminate aircraft landing on Runway 4R from waiting to cross Runway 4L and aiming their intake noise toward Constitution Beach. Section 6.4 of the Supplemental DEIS/FEIR discusses the air quality benefits of the Centerfield Taxiway.
66.3	Alternatives	Taxiway Improvements	Wants discussion of having shorter Centerfield taxiway only in southern half of airfield.	One of the major benefits of the Centerfield Taxiway is to provide an impeded path from the north sector of the airfield to the south. This will prevent Runway 4R arrivals from queuing in the northern sector, and will reduce queues for Runway 22L departures. Refer to Section 3.3.1 of the Supplemental DEIS/FEIR for more discussion of the Centerfield Taxiway's operational benefits.
66.4	Alternatives	Reduced Approach Minima	Requests expansion of discussion on lowering minimums and specifics on the July 31, 1980 agreement between Massport, the FAA and the City of Boston.	The 1980 agreement between Massport and the FAA required an EIS analysis before any change in the minimums would be affected. The proposed reductions in minimums are analyzed in the EIS documents for the Airside Project. Reduced landing minimums provide for a safer approach by providing precision guidance at lower altitudes, and thus a safer approach. The reduced landing minimums do not change the approach path nor reduce the clearance between aircraft and the surface. Rather, they shift the location at which a missed approach decision is initiated closer to the airport. For Runways 27 and 22L, the reduced minimums will make the approach procedures flown by pilots more consistent with FAA standards in effect at most other airports. Reduced landing minimums will increase airfield safety by allowing operations more directly into the prevailing wind and will help improve PRAS goal achievement.

Statement of Scott Godfrey
Director, Eastern Region
Air Transport Association of America
on the
Logan Airside Improvements Planning Project
08 APR 99

LETTER 67

My name is Scott Godfrey and I am the Director of the Eastern Region Office of the Air Transport Association of America which is headquartered in Washington, DC. The ATA represents the 23 major passenger and cargo airlines in the U.S..

Today, I am speaking for all these airlines, their respective employees and the passengers and shippers using Logan International Airport. ATA and the airlines serving Boston Logan Airport support the Logan Airside Improvements Planning Project in its entirety. As a partner with Massport, local officials, and community representatives throughout the comprehensive process leading to the submission of the Draft Environmental Impact Statement/Environmental Impact Report; we believe that the benefits to be garnered by all partners weigh heavily in support of the project.

The present operational posture within which the airport operates results in significant delays during certain wind conditions. The efficiency of the airport's operation is severely compromised during these times due to the lack of a runway configuration compatible to the operational requirements otherwise addressed by the available runways in all other wind situations. The obvious solution to this problem is the implementation of Massport's plan which includes the construction of runway 14/32. 67.1

The ATA can not stress enough the importance of the reduction of the current delays which plague Boston Logan Airport and the corresponding level of service which we can provide to the passengers and shippers utilizing the airport. It is also our position that the implementation of the entire project will lower the overall noise impact on the surrounding communities. This is due to the uni-directional orientation of the new runway and the efficiency gains which will cause a reduction of delayed late night operations which currently impact citizens at the most intrusive time of day. 67.2

Additionally, air traffic system and pilot operational safety benefits will be realized; a lessening of fuel emissions from delayed aircraft on the ground will result; and associated economic benefits for the greater Boston area will be gained. 67.3

In the interest of time, the ATA will submit a more detailed presentation of these and all the pertinent items via a written submission to the appropriate state {MEPA Office} and federal {FAA} agencies.

Letter 67
Air Transport Association of America
Scott Godfrey, Director Eastern Region

Code	Topic 1	Topic 2	Comment	Response
67.1	Alternatives	Runway 14/32	The obvious solution to this problem [delays] is the implementation of Massport's plan which includes the construction of Runway 14/32.	The improvement concepts evaluated in the Airside Project Analysis evolved from prior studies including the FAA's *Logan Capacity Enhancement Plan* (October 1992); the *Logan Runway Incursion Mitigation Plan/Taxiway Relocation Study* (December 1993); the *Logan Final GEIR* (July 1993); and the *Logan Airside Improvements Feasibility Study, Phase 1 Report*, published in July 1995. The FAA evaluated a numerous physical, operational, and administrative concepts for reducing Logan Airport delays in its *Boston Logan International Airport Capacity Enhancement Plan*. The FAA recommended several improvement concepts, including unidirectional Runway 14/32, for further study. These improvement concepts, as well as concepts from other studies, were individually examined by Massport in the *Logan Airside Feasibility Study*, published in July 1995. Based on the Feasibility study, some concepts were rejected and the most promising concepts were combined into the Alternatives considered in the Airside Project Draft EIS/EIR. The alternatives analysis in the Airside Project Draft EIS/EIR is consistent with state and federal scoping directives for the Airside Project. The results of the Airside analysis indicate that alternatives that include unidirectional Runway 14/32 provide the most benefit in terms of delay reduction and ability to achieve PRAS goals.
67.2	Alternatives	Preferred Alternative	... the implementation of the entire project will lower the overall noise impact on the surrounding communities.	Comment noted.
67.3	Air Quality	Impacts	... a lessening of fuel emissions from delayed aircraft on the ground will result; ...	Comment noted.

Air Transport Association

LETTER 68

April 21, 1999

Secretary of Environmental Affairs
Attention: MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge ST
20th floor
Boston, MA 02202

Subject: **Logan Airside Improvements Planning Project**
Boston-Logan International Airport

Reference: **Draft EIS/EIR**

Dear Sir:

Pursuant to my testimony on April 8, 1999, at the second public hearing on this subject, the following comments are submitted by the Air Transport Association (ATA).

As Director of the Eastern Region office of the ATA, which represents the 23 major passenger and cargo airlines of the U.S., we support the improvements in the Logan Airside Improvements Planning Project in their totality as delineated in the preferred Alternative 1A.

ATA throughout the years has been an active participant with Massport and the FAA, working to enhance the efficiency of Logan air traffic operations which have suffered increasingly high levels of delay. The ATA Eastern Region, through its participation in the Airside Review Committee, has worked to insure that proposed improvements, specifically, this project, were coordinated with all concerned public and private constituencies. It is, therefore, our position that Massport has adequately fulfilled all necessary and reasonable requirements through the comprehensive processes leading to the submission of the subject document. 68.1

Due to the physical limitations of Logan Airport which have not been altered since 1977, and the increasing level of delays, Massport is justified in proposing this project to address

the root problem of airport efficiency and delay reduction. The airline industry acknowledges the overwhelming cost to our passengers and shippers which results from the current unacceptable level of delay. The ATA cannot stress enough the importance of the reduction of these delays and the corresponding change in the level of service we can provide. Additionally, if not adequately addressed now, we believe the delay situation will only worsen.

Supporting data for the preceding statements is adequately covered in the subject document.

Specifically addressing Alternate 1A, we submit the following:

a. All items addressing the taxiway improvements offer an increase to the level of safety regarding surface movement of aircraft as well as an increase in the efficiency of these operations. Because of a more efficient ground operation, a corresponding decrease in engine noise and fuel emissions will be experienced. This represents a significant benefit to the entire airport community and airport neighbors. 68.2 68.3

b. The proposed reduction in ILS landing minimums offers two main benefits: it will permit aircraft to land during weather conditions which currently prohibit such operations resulting in delays; and will allow the use of additional runway configurations. This will give controllers greater flexibility in runway assignment and present a greater opportunity to attain the legally designated PRAS goals. 68.4

   The level of safety is increased by reducing controller and pilot workload associated with executing unplanned actions including holding and diverting.

c. The construction of uni-directional Runway 14/32 is the keystone of the project. Due to the overwhelming amount and excessive length of delays caused by northwest wind conditions, the proposed runway offers the single most significant initiative to reduce these delays. The operational posture within which the airport operates now results in significant delays during weather and wind conditions as described in the subject document. The efficiency of the airport's operation is compromised during these times due to the lack of a runway configuration compatible with the operational requirements otherwise addressed by the available runways in all other wind conditions. 68.5

LETTER 69

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge St. 20th Floor
Boston, MA 02202

April 23, 1999

The Alliance of Boston Neighborhoods strongly opposes the construction of Runway 14/32.

We are dismayed that Massport is violating its legal protected commitments to the affected neighborhoods. Public agencies are obligated to protect the public interest as they carry out their specific missions; this proposal fails to honor the public trust, at the continuing expense of the residents of nearby communities. 69.1

This runway will increase noise and pollution in Boston neighborhoods, including East Boston, Charlestown, South Boston, South End, Beacon Hill, Back Bay, Roxbury, Jamaica Plain, and possibly Hyde Park, Roslindale and West Roxbury. We urge a more equitable distribution of the burdens of economic growth. This is particularly true when the affected neighborhoods have benefited least from such growth. 69.2

The city and regional transportation infrastructure is not capable of supporting the expansion expected with this runway, and indeed, expected regardless of this runway. Neither visitors nor local travelers will benefit if they cannot get to and from the airport. 69.3

Massport's cost-benefit analysis of the proposed project values every minute of passenger time spent in delays, however brief, without adequate concern for city life. The cumulative costs to residents, in productivity lost due to interrupted communication and disruption of sleep, loss of outdoor recreational opportunity, respiratory and other health problems, decreased property values, and many other flight impacts are not calculated. 69.4

The proposed runway is a short term, local solution for a basic regional problem. The damage to afflicted neighborhoods will be permanent; however, the capacity controversy will face us again in a few years. 69.5

A regional plan for all transportation modes must be developed, considering new high-speed rail, and other airports and potential transit improvements. Peak-hour pricing, small-aircraft and freight redistribution, and other methods for rationalizing airport utilization must be examined. Massport must join with other public agencies as appropriate to develop a comprehensive, long-range regional transportation plan. 69.6 69.7

Sincerely,

Shirley Kressel
President

Frank Jordan
Vice President

Ned Flaherty
Secretary

Code	Topic 1	Topic 2	Comment	Response
69.1	Environmental Review Process	MEPA	... this proposal fails to honor the public trust, at the continuing expense of the residents of nearby communities.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* (previously the GEIR) and its updates. Massport and FAA have complied with all applicable state and federal requirements.
69.2	Noise	Impacts	This runway will increase noise and pollution in Boston neighborhoods, ...	Refer to response to Comment 69.1.
69.3	Ground Transportation	Access to Logan Airport	The city and regional transportation infrastructure is not capable of supporting the expansion expected with this runway, and indeed, expected regardless of this runway. Neither visitors nor local travelers will benefit if they cannot get to and from the airport.	Massport has in place an extensive Ground Access Management Plan, the primary goals of which are to: increase the overall efficiency of the metropolitan transportation system through interagency coordination; increase annual air passenger HOV mode share to 35.2 percent by the time annual air passengers reach 37.5 million; reduce employee reliance on commuting alone by private automobile; provide adequate long-term parking within the limits of the Logan Airport Parking Freeze; and improve management of ground access and infrastructure through technology. Key achievements in reaching those goals include: Establishment of the Logan Airport Transportation Management Association (TMA). Massport provided subsidies for TMA members on Logan Express and MBTA. TMA members ride the Rowe's Wharf Water Shuttle for free; hired professional TMA firm to operate the Logan Airport TMA. Record ridership on the Logan Express bus service (exceeded over one million passengers in 1998 and 1999) and planning for a fourth Logan Express location. Construction of the Woburn Regional Transportation Center which will include 900 new parking spaces for Logan Express (construction completed in 2000) Planning for the Airport Intermodal Transit Connector which will provide a direct link between Logan Airport and South Station/Red Line. Initiation of the Logan DART bus service between Logan Airport and South Station. Participation with the MBTA in planning for the redesigned new Airport Station to include wide escalators, flight information monitors, and other air passenger amenities. Continued the operation of free shuttle buses between Airport Station, Water Shuttle dock, and terminals. To "Provided a dedicated DART bus dock at South Station with direct service to the airport. Implemented Logan Direct service from the South Shore. Continued marketing and advertising of HOV services through use of 1-800-23LOGAN telephone service and other media. Continued implementation of commercial vehicle lane, Neptune Road exit ramp peak period forced turnaround, local street closures, and traffic volume restrictions at Maverick Street. Continued traffic monitoring, curbside monitoring, and traffic control improvements. Refer to the *Logan Airport 1994/95 GEIR* which includes Massport's Ground Access Management Plan.

Code	Topic 1	Topic 2	Comment	Response
69.4	Alternatives	Runway 14/32	... cost-benefit analysis ... The cumulative costs to residents, in productivity lost due to interrupted communication and disruption of sleep, loss of outdoor recreational opportunity, respiratory and other health problems, decreased property values, and many other flight impacts are not calculated.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR documents comply with all applicable NEPA and MEPA requirements. A cost benefit analysis is not required by federal or state law and would not provide appropriate context. Cost information mentioned in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR is intended to provide analytic context.
69.5	Alternatives	Runway 14/32	The proposed runway is a short-term, local solution for a basic regional problem.	The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR provide an evaluation of the regional airports at T. F. Green/Providence, Manchester, and Worcester Regional and their potential impacts on Logan Airport. Hanscom Field is the region's premier general aviation facility and accommodated over 180,000 aircraft operations in 1998. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to the growth pressures at Logan Airport. Nevertheless, the proposed Logan Airport Airside Project is necessary and provides clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
69.6	Regional Transportation	Passenger Rail	A regional plan for all transportation modes must be developed, considering new high-speed rail, and other airports and potential transit improvements.	Massport's analysis of options to Logan Airport is comprehensive and reflects all the major recommendations of various regional planning studies that have been conducted over the last decade. These include expansion of the regional airports and development of high-speed rail in the Boston-New York market. Chapter 2 of the SDEIS/FEIR provides a description of regional transportation mode alternatives.
69.7	Alternatives	Non-Construction Alternatives	Peak-hour pricing, small-aircraft and freight redistribution, and other methods for rationalizing airport utilization must be examined.	The airside analysis indicates that PPP would produce minimal delay reduction benefit in the current operating environment at Logan Airport while imposing significant costs on regional carriers and the communities that they serve. In contrast, the proposed unidirectional Runway 14/32 would produce immediate delay reduction benefits that will increase in the future as forecast activity levels grow. While the regional airports at Manchester and T.F. Green/Providence have experienced exceptional traffic growth over the past several years, traffic at Logan Airport has continued to grow. In the future, continued development at the regional airports should relieve some of the traffic growth pressures at Logan Airport, resulting in a reduced rate of traffic growth. Nevertheless, options to Logan Airport do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. The potential diversion of cargo operations was not specifically analyzed because cargo operations account for only two percent of aircraft activity at Logan Airport and since most all-cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.

LETTER 70

MEPA PUBLIC HEARING
APRIL 8, 1999

GOOD EVENING. I'M ED FRENI, GENERAL MANAGER FOR AMERICAN AIRLINES HERE AT LOGAN AIRPORT. I'M HERE TONIGHT TO UNDERSCORE AMERICAN'S SUPPORT FOR THE MASSPORT AIRSIDE IMPROVEMENT PROJECT. WE BELIEVE THAT A NEW UNI-DIRECTIONAL RUNWAY FOR REGIONAL AIRCRAFT WILL BENEFIT ALL CARRIERS AT LOGAN.

A NEW RUNWAY WILL HELP REDUCE DELAYS AT LOGAN AND ALLOW THE AIRPORT TO OPERATE MORE EFFICIENTLY WHEN THE WINDS ARE NORTH-WESTERLY. THIS ENABLES THE AIRPORT TO OPERATE THE THREE-RUNWAY CONFIGURATION THAT IS REQUIRED TO HANDLE THE DEMAND. 70.1

A PLANE THAT IS LATE IN LEAVING LOGAN LIKELY WILL BE LATE IN ARRIVING AT ITS DESTINATION. AND, WHETHER WE TALK ABOUT A COMPLEX, INTENSIVE HUB AND SPOKE OPERATION, OR A TIGHTLY-SCHEDULED POINT-TO-POINT NETWORK, IT DOESN'T TAKE MUCH TO THROW AN ENTIRE DAY'S SCHEDULE OUT OF WHACK.

AS DELAYS INCREASE, THE COSTS OF PROVIDING RELIABLE SCHEDULES TEND TO RISE EVEN FASTER, WHICH CAN RESULT IN HIGHER FARES. AND AS ANYONE WHO HAS EXPERIENCED A CROWDED CHAOTIC TERMINAL DURING A SEVERE WEATHER EVENT KNOWS, ANYTIME AN AIRLINE'S CAPACITY IS RESTRICTED, THE QUALITY OF SERVICE WE CAN OFFER OUR CUSTOMERS DECLINES DRAMATICALLY.

IMPROVING THE EFFICIENCY OF AN AIRLINES' OPERATION AT LOGAN WILL ALSO ENABLE THE CARRIER TO CREATE A MUCH LESS ENVIRONMENTALLY OFFENSIVE PRODUCT. WITH LESS WAITING TIME ON THE GROUND WE'LL DEFINITELY REDUCE FUEL BURN AND EMISSIONS. 70.2

AMERICAN HAS A LONG AND RICH HISTORY IN BOSTON. WE BEGAN SERVICE HERE BACK IN 1927 WITH A NONSTOP FLIGHT TO NEW YORK. THE AIRCRAFT - A SINGLE-ENGINE FOKKER -- CARRIED SIX PASSENGERS, A PILOT AND A CO-PILOT. IT TOOK TWO AND A HALF HOURS TO REACH NEW YORK.

TODAY, AMERICAN OPERATES MORE THAN 70 DAILY FLIGHTS AND CARRIES THOUSANDS OF PEOPLE TO DESTINATIONS THROUGHOUT THE UNITED STATES, AND TO PUERTO RICO, LONDON, ENGLAND AND PARIS, FRANCE.

ON JUNE 1. WE'LL CELEBRATE TWO MAJOR EVENTS AT LOGAN. WE'LL LAUNCH NONSTOP SERVICE TO SEATTLE USING OUR NEW "NEXT GENERATION" BOEING 737-800 AND WE'LL MARK THE 40TH ANNIVERSARY OF THE VERY FIRST JET FLIGHT AT LOGAN.

TODAY, AMERICAN IS A TOP CARRIER AT LOGAN, WITH 4.5 MILLION PASSENGERS COMING THROUGH OUR GATES EACH YEAR. AND NEARLY 2,500 AMERICAN AIRLINE'S EMPLOYEES CALL BOSTON HOME.

"WE MEAN BUSINESS IN BOSTON" IS NOT ONLY OUR SLOGAN, BUT IT'S A COMMITMENT TO PROVIDING QUALITY SERVICE TO OUR PASSENGERS AND CUSTOMERS.

BUILDING A NEW RUNWAY WILL HELP US LIVE UP TO OUR COMMITMENT. IT IS GOOD FOR LOGAN AIRPORT AND IT WILL BE GOOD FOR THE AIRLINES THAT SERVE LOGAN.

THANK YOU.

Letter 70
American Airlines
Ed Freni, General Manager

Code	Topic 1	Topic 2	Comment	Response
70.1	Purpose and Need	Delays	A new runway will help reduce delays at Logan and allow the airport to operate more efficiently when the winds are north-westerly.	Comment noted.
70.2	Air Quality	Emissions Reduction	With less waiting time on the ground we'll definitely reduce fuel burn and emissions.	Comment noted.

LETTER 71

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley - EOEA No. 10458
100 Cambridge St. 20th. Floor
Boston, MA 02205

Dear Mr. Pugsley:

As a member of the Greater Boston Chamber of Commerce I recently received a letter from the organization's President and CEO requesting that members write to you in support of expanding Logan Airport (see copy enclosed). I am writing to inform you that I do not support Logan runway (14/32) expansion.

Much has been written in local newspapers both supporting and opposing Logan Airport expansion. I will not bore you by reiterating what you already known, but to take this opportunity to emphasis the need for responsible leadership. The air traffic problems currently facing Logan Airport did not spring up overnight. Increased air traffic has been the topic of discussions for several years. Where has the Massachusetts Port Authority been? Certainly they have had time to put together a long-term plan to address air traffic issues. Instead they recommend adding another runway, which by all acknowledgment is a short-term solution lasting up to five years! What then? I request that you deny environmental permitting and encourage the Massachusetts Port Authority to fulfill their responsibility by making an effort to develop a truly long-term solution. 71.1

The enclosed letter includes several generalized statements that sound as though the vitality of Massachusetts' economic future hinges upon the single event regarding Logan Airport expansion. I truly hope this is not the case, otherwise it is time for all of us to look outside the Commonwealth for a better living environment.

For other citizens of the Commonwealth and myself I thank you in advance for your time and efforts regarding this matter.

Sincerely,

Ray Molinaro
President

Re: Logan Airside Improvement Planning Project: DEIR/DEIR

Dear Secretary Durand:

Based upon our review of documentation and our participation in the CAC and ARC, the Beacon Hill Civic Association (BHCA) reiterates opposition to Massport's proposal to construct a new runway at Logan Airport. While the arguments for and against Massport's plan are many and complex, the following is a brief summary of our opposition:

1. We need a long-term, encompassing plan now; we need much more than a short-term, 20% fix. Massport's plan affords partial, temporary relief which does not effectively address the long-term, growing problem. Massport's plan is based on obsolete weather data, its delay model is different from and unreconciled with the FAA's calculations, and its plan forecasts only 11 years, probably only 5-7 years after completion. Massport tries to justify the runway in order to increase throughput and decrease delays in bad weather conditions. The new runway will increase actual operations annually, thereby expanding current capacity. Operations are projected to continue to grow without limits; and delays are also projected to continue to increase from the temporary, slightly decreased, level right after the new runway, eventually exceeding currently levels within a very few years. In the future operations will continue to increase without limits. Postponing a more encompassing solution will make it more difficult, painful, and expensive to achieve, if ever, at a later date. Why are we allowing a more massive pile up to develop and ignoring the responsible solution? 72.1 72.2

Bob Durand

April 22, 1999

The Association seeks your assistance in requiring Massport to develop an environmentally responsible, long-term plan which facilitates air traffic while respecting the health and well-being of all those affected.

Very truly yours,

Code	Topic 1	Topic 2	Comment	Response
72.1	Analysis Assumptions/ Methodologies	Planning Period	We need a long-term, encompassing plan now; we need much more than a short-term, 20% fix.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.
72.2	Delay	Model	... its delay model is different from and unreconciled with the FAA's calculations, and its plan forecasts only 11 years, probably only 5-7 years after completion.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The planning scenarios for 29, 37.5 and 45 million passengers represent a range of future activity at Logan Airport expected in the 1999 to 2020 time frame.

Pursuing A Better Quality of Life Under The Crowded Skies

The Beachmont Neighborhood Association (hereafter referred to as "BNA") on April 14, 1999, sponsored an open meeting on the issue of Massport's Logan Airside Improvement Planning Project (hereafter referred to as the "Proposal"). We remain grateful for Massport's accommodation to our request for their participation at our neighborhood meeting.

Held at the Beachmont V.F.W., the meeting attracted 65 attendees representing mostly Revere residents but mixed with a few from other affected communities. The purpose of the meeting was three-fold: 1) to inform interested residents about the Proposal, which is a very significant and rather complicated issue; 2) to afford interested residents the opportunity to discuss the Proposal's ramifications; and, 3) to provide a forum for questions to both opponents and proponents. A team of Massport spokespersons delivered a detailed explanation of the Proposal with the audience responding in general disagreement. Overall, the program was informative and interesting but, at the same time, quite disturbing to most of the audience.

First, the BNA believes the Proposal as presented is flawed in that it includes at least two projects that we consider to pose direct threat to the Beachmont neighborhood. The concerning projects are: 1) the introduction of Runway 14/32; and, 2) the reduction in aircraft approach minimums.

As for Runway 14/32, we are concerned by the potential posed for increased air traffic and the noise and air pollution its establishment would bring. The promise of a brief reprieve from current noise levels for Revere and a few other communities is far from a justification for the BNA to support it. **As for the reduction in aircraft approach minimums**, we are concerned with what we perceive to be the serious safety factor in lowering the ceiling for planes landing in conditions of low visibility. We also predict that, as pilots would advance to a lower altitude before learning of a need to abort landing plans, the exhaust fumes and noise associated with resuming full-throttle to lift away would present a worsening of our already beleaguered situation.

73.1

73.2

The BNA favors economic vitality for Greater Boston's business communities. We favor energized focus on moving Boston toward a "world class" city. We are also keenly aware of the vital role air traffic plays in such development.

..... more

The BNA favors a more equitable distribution of noise levels among affected areas. 73.3

The BNA, in fact, favors an efficiently-operated first class airport at Logan International Airport, but stands opposed to such development when the burden of shouldering it is constantly placed on the few unfortunate communities that surround the airport. We believe this to be unfair and unjust.

Simply put, we are opposed to expansion at Logan International Airport because we already have more than enough traffic, air and noise pollution. The BNA is convinced the Proposal is destined to bring more pollution. We are convinced, too, that the next proposal (which the current Proposal, if accepted, will necessitate) will bring even more. We simply do not want any more.

In order to avoid ending negatively, the BNA offers the following recommendations. We hope that Massport can continue to work with affected communities in order to:

1) Devise a regional plan for aircraft operations in eastern Massachusetts, both for immediate and long-term future needs; 73.4
2) Embark upon a fair, impartial and complete evaluation of Hanscom Air Field and Worcester Airport as to what roles they each are capable of assuming in the short term to alleviate Logan's congestion, and in the long-term as alternative airports; 73.5
3) Study what further can be done to create and then mandate quieter aircraft; and, 73.6
4) Agree with sincerity to select locations as sites for three (3) additional airports to be developed within eastern Massachusetts. 73.7

*The BNA is an organization founded to serve as a focal point for community action dedicated to improving the quality of life in Beachmont and to joining in common effort with other groups for such purpose.

.....end

Letter 73
Beachmont Neighborhood Association

Code	Topic 1	Topic 2	Comment	Response
73.1	Alternatives	Runway 14/32	As for Runway 14/32, we are concerned by the potential posed for increased air traffic and the noise and air pollution its establishment would bring.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
73.2	Alternatives	Reduced Approach Minima	As for the reduction in aircraft approach minimums, we are concerned with what we perceive to be the serious safety factor in lowering the ceiling for planes landing in conditions of low visibility.	Reducing the current landing minimums for Runways 15R, 22L, and 27 at Logan Airport will not increase noise levels. Aircraft will follow the same arrival paths, at the same altitudes as today, but the location at which a missed approach decision must be made will be moved closer to the airport. Since missed approaches rarely occur, they have no discernible effect on the cumulative noise. For example, reducing the Runway 22L decision height to 200 feet moves the maximum noise point to approximately 3,000 feet from touchdown which is further from populated areas in East Boston than the current maximum noise point. Although categorically excluded from NEPA review, modeling of the changes in runway availability from reductions in the approach minimums and an analysis of the potential impacts on community noise exposure that may result were included in the Airside Project in compliance with an earlier agreement among Massport, the FAA and the City of Boston.
73.3	Noise	Impacts	... favors a more equitable distribution of noise levels among affected areas.	Implementation of Runway 14/32 would not result in substantial noise impacts in any community. Rather, it would enable the air traffic controllers to adhere more closely to the PRAS goals and decrease the population that is most severely affected. For example, implementation of the Preferred Alternative will reduce the population affected by Day-Night Sound Level values greater than 70 dB by four percent with the 29 M Low Fleet scenario, by 67 percent with the 37.5 M High Fleet scenario, and by 39 percent with the High Regional Jet Fleet, while increasing the population exposed to Day-Night Sound Level values greater than 65 dB by two percent, zero percent, and three percent for these three fleet scenarios, respectively. Refer to Section 6.2.5 of the Supplemental DEIS/FEIR and population counts presented in Tables 6.2-3 through 6.2-12 of the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
73.4	Regional Alternatives	Regional Airports	Devise a regional plan for aircraft operations in eastern Massachusetts, both for immediate and long-term future needs;	Chapter 2 of the Supplemental DEIS/FEIR provides a discussion of the specific role played by the regional transportation alternatives and steps that Massport has taken to foster use of these alternatives. Massport has long recognized and has been a proponent of options to Logan Airport. Together with the regional airports, Massport has implemented a regional strategy to enhance the use of options to Logan Airport. In the Draft EIS/EIR, Massport identified up to 7.3 million annual passengers that could be absorbed by regional alternatives that include use of T.F. Green/Providence, Manchester and Worcester Regional airports, as well as the new high-speed rail to New York. In the Supplemental DEIS/FEIR, Massport recognizes that these developments will slow Logan Airport's passenger traffic growth. Logan Airport may not achieve the 37.5 million passenger forecasts until after 2010, but rather closer to 2015, and the 45 million passenger forecasts may not be achieved until after 2020. While regional alternatives can play an important role in reducing the rate of future traffic growth at Logan Airport, they do not address Logan Airport's inability to efficiently accommodate current levels of demand during northwest wind conditions. Runway 14/32, which is designed to correct the problem with Logan Airport's layout, is necessary to correct this deficiency and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
73.5	Regional Alternatives	Regional Airports	Embark upon a fair, impartial and complete evaluation of Hanscom Airfield and Worcester Airport as to what roles they each are capable of assuming in the short term to alleviate Logan's congestion, and in the long-term as alternative airports;	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field. Since 1995, Massport has worked closely with the City of Worcester to aggressively market the Worcester Regional Airport to airlines. Massport increased its involvement with the Worcester Regional Airport by assuming operational responsibility of the airport on January 15, 2000. By its agreement with the City of Worcester, Massport could assume ownership of the Worcester Regional Airport by 2005. On February 1, 2000, Delta Connection began serving Worcester Regional Airport with two daily nonstop roundtrip flights on regional jet aircraft to Atlanta. On July 6, 2000, American Eagle began service to New York JFK Airport with three daily nonstop roundtrip flights on turboprop aircraft. Massport is in ongoing discussions with other carriers regarding potential new services at Worcester Regional Airport. In addition, MassHighway is analyzing alternative highway routes that would improve surface access from I-90 and I-290 to the Worcester Regional Airport and filed an ENF in December 1999. They have begun the preparation of a Airside Project Draft EIS/EIR for these improvements, which is expected to be filed in October 2001.
73.6	Noise	Impacts	Study what further can be done to create and then mandate quieter aircraft;	NASA is conducting a major research project, funded in part by the FAA, to determine what can be done to develop quieter aircraft. This project should provide the technical feasibility for developing quieter aircraft in the future.
73.7	Regional Alternatives	Regional Airports	Agree with sincerity to select locations as sites for three (3) additional airports to be developed within eastern Massachusetts.	Comment noted.

LETTER 74

Secretary of Environmental Affairs
Attention MEPA Office
Mr. Arthur Pugsley – EOEA No. 10458
100 Cambridge Street
20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

As a financial securities industry executive who uses Logan Airport quite frequently, I am writing to strongly support the Massachusetts Port Authority's proposal regarding the construction of runway 14/32. In addition, as the Vice Chairman of the Greater Boston Chamber of Commerce's Economic Development and Transportation Committee, I am extremely concerned that the regional economy will suffer greatly if the proposal is not approved. 74.1

Because I personally use commercial airlines flying out of or into Logan as many as six times a week, I am acutely aware of the problems caused by the increasing delays. As the eleventh-ranked U. S. airport in terms of operations, Logan currently ranks sixth in the nation in flight delays. I understand that last year alone, such delays amounted to 120,000 hours and cost approximately $319 million. As just one recent example, I was delayed over three hours last week in returning from New York City on the Delta Shuttle when one flight was cancelled and another delayed on the ground, as well as enroute, because windy conditions required Logan to operate with only one runway. As a result, I missed a business appointment in Boston, --a circumstance which could jeopardize my firm's ability to compete for a significant assignment. This was hardly an isolated incident and it is the type of problem that many of my Bear Stearns colleagues who visit Boston and our 200 employees who are based in the Boston office experience all the time. My own flights in and out of Logan have been delayed literally dozens of times because of similar conditions during the past year. Many, if not all of these delays would likely have been eliminated if runway 14/32 existed.

As the major airport in New England, Logan is a key driving force in the regional economy, with an impact of $5 billion annually. It employs more than 15,000 people and supports over 100 airport-related businesses. Continuing our regional economic growth and insuring the future fiscal health of the Commonwealth and surrounding states are

highly dependent on the success of the runway 14/32 project. As New England faces greater competition both nationally and abroad, having an airport that operates efficiently will become increasingly critical to our future.

Unfortunately, regional transportation measures will not provide sufficient relief for the problem of Logan delays. While Amtrak high-speed rail and growth at other regional airports are also necessary, they cannot begin to deal with the projected demand for air travel to Boston during the next decade. The runway 14/32 initiative, together with the entire Logan modernization project, thus strongly deserves your approval.

Sincerely,

John W. Gillespie

LETTER 75

April 12, 1999

Mr. Arthur Pugsley
Secretary of Environmental Affairs - MEPA
100 Cambridge Street – 20th Floor
Boston, MA 02202

Dear Mr. Pugsley:

Re: EOEA 10458

I am writing on behalf of the 1,200 businesses and companies that are members of the Greater Boston Convention & Visitors Bureau, Inc.

We wish to be recorded in favor of the proposed unidirectional runway project 14-32 at Boston Logan International Airport.

This proposed runway will significantly reduce delays at Logan Airport and allow it to operate much more efficiently.

In the short term, the proposed runway project is the most realistic way in which to address Logan's delay problem. Even with the dramatic growth of regional airports in Providence and Manchester and the potential of Worcester and Portland Airports, as well as high-speed rail between Boston and New York, Logan will continue to be the airport of choice for business travelers and convention delegates. 75.1

If Logan's well-documented delay problems are not addressed, the ability of the region's visitor industry to compete for business will be compromised; and the economic benefits it generates will be threatened. 75.2

With major new transportation infrastructure already underway and a new convention center and new hotels planned for the Seaport District, Boston and Cambridge will be well positioned to compete for major national and international meetings and conventions. Those bids, however, may not be successful if the region's major airport, Logan International Airport, has a performance record of not operating in an efficient way. Meeting planners in evaluating bids look at the ability of the convention center to house their convention, the number and availability of hotel rooms in close proximity to the convention center and the ability of the airport to operate efficiently both on the

groundside and airside. Without the proposed runway, our convention and meetings business will be threatened; and we could lose out on much of the business that the new convention center in the Seaport District is expected to generate.

If there is any additional information you need, please let us know.

Sincerely,

Patrick B. Moscaritolo
President and CEO

Project Location:	**Boston-Logan International Airport-Boston / Winthrop**
Project Proponents:	**Massachusetts Port Authority, Federal Aviation Administration**
Project Number:	**EOEA No. 10458**

Dear Mr. Pugsley and Mr. Silva:

On behalf of the Boston Harbor Island Advisory Council I wish to communicate two motions that were passed at the April 8, 1999 meeting of the Council. The Boston Harbor Island Advisory Council is a twenty-eight-member council appointed by the Director of National Park Service. The Advisory Council was formed to advise and make recommendations to the Boston Harbor Islands Partnership with respect to the development and implementation of an integrated management plan and the operation of the newly created Boston Harbor Islands National Recreation Area.

Motion 1: The Advisory Council cannot support the Draft Environmental Impact Report (EIR)/ Draft Environmental Impact Statement (EIS) filed by Massport and the Federal Aviation Administration if the addition of a new runway and associated taxiway leads to more overflights of the Boston Harbor Islands. 76.1

Motion 2: The Advisory Council requests that Massport and the Federal Aviation Administration withdraw the Draft Environmental Impact Report (EIR)/ Draft Environmental Impact Statement (EIS) until a more comprehensive analysis of the benefits and impacts the proposed runway and associated taxiway can be presented. Additionally, there should be greater involvement by a spectrum of interested parties to seek a long-term solution to the regions transportation needs. 76.2 76.3

If you have any questions please do not hesitate to call. Thank you.

On behalf of the Boston Harbor Island Advisory Council

Philip E. Lemnios

76.1	Alternatives	Preferred Alternative	...cannot support the Draft Environmental Impact Report (EIR)/...if the addition of a new runway and associated taxiway leads to more overflights of the Boston Harbor Islands.	The Boston Harbor Islands, while within the No Action Alternative (Alternative 4) 65 dB Day-Night Sound Level (dB DNL) contour, will have no noise increase with the Preferred Alternative. Refer to Section 6.3.3 of the Supplemental DEIS/FEIR for additional discussion of parklands relative to the Preferred Alternative.
76.2	Environmental Review Process	MEPA	...requests that Massport and the Federal Aviation Administration withdraw the Draft Environmental Impact Report (EIR)/Draft Environmental Impact Statement (EIS) until a more comprehensive analysis of the benefits and impacts the proposed runway and associated taxiway can be presented.	In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts. The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.

Code	Topic 1	Topic 2	Comment	Response
76.3	Environmental Review Process	Public Process	...there should be greater involvement by a spectrum of interested parties to seek a long-term solution to the regions transportation needs.	Massport has a history of engaging in cooperative regional transportation planning and continues its efforts to promote an efficient and balanced regional transportation system. There was an extensive public participation and review process during the preparation of the Airside Project Draft EIS/EIR. Public comments were received on the ENF after it was filed during the summer of 1995. In the fall of 1995, several public scoping sessions were held to provide community input to the subsequent state and federal scopes for the project. To assure that the Airside analysis was conducted with awareness and input from all concerned parties, the Massport Board established the Airside Review Committee (ARC), which consists of the Community Advisory Committee (with representatives from 24 communities surrounding Logan Airport), and 11 businesses and industry organizations. Massport also funded independent consultants for the CAC to provide them with the capacity to professionally assess the analysis and conclusions of the Airside Study. Between 1995 and 1999, Massport held 16 meetings with the ARC, an additional 15 meetings with just the CAC, and several meetings with the CAC consultants. In addition, Massport made 29 presentations to elected officials, most of whom represent Logan Airport's neighboring communities, and Massport held 45 meetings with community and business leaders, reaching an audience of more than 3,000 people. During the public comment period on the Airside Project Draft EIS/EIR, the FAA held two public hearings. In January 2000, in response to the FAA's review of the Draft EIS, the FAA called for preparation of a Supplemental Draft EIS to address specific issues identified by the FAA following input from a SDEIS Panel consisting of six persons. At the FAA's direction, three SDEIS Panel members were appointed by the Governor of the Commonwealth of Massachusetts and three were appointed by the Mayor of the City of Boston. Under the direction of the New England Region FAA, the SDEIS Panel convened in March of 2000 and then met at least monthly with a final meeting in December of 2000. Twelve meetings were held. To provide the appropriate background, the SDEIS Panel was presented with an Interim Supplemental Draft EIS, the Draft EIS/EIR, answers to key letters written by members of the public, concerned agencies and public officials responding to the Draft EIS/EIR, and a series of 15 visual and written presentations from the Project's technical consulting team and other independent industry experts.

BRITISH AIRWAYS

April 8, 1999

LETTER 77

Secretary of Environmental Affairs
ATTN: MEPA
Mr. Arthur Pugsley
EOEA #10458
100 Cambridge St. - 20th Floor
Boston, MA 02205

Dear Mr. Pugsley:

British Airways wishes to express its support for the series of airside improvements currently proposed by Massport. In an effort to reduce delay and improve efficiency on Logan's airfield, we support the following projects:

⇒ Construction of an uni-directional reliever runway 14/32 for local over the water operations.

⇒ Construction of a centerfield taxiway to reduce taxiway congestion. 77.1

⇒ Realignment and extension of existing taxiways to enhance airfield safety.

⇒ Reduction of approach minimums on runways to upgrade Logan Airport to industry standards.

On behalf of our Customers, 553,943 passengers who traveled through Logan on British Airways in 1998 and who annually ship over 22 million tons of cargo and mail in and out of Logan Airport, we strongly reiterate our support for the Logan Airside Improvement Planning Project (EOEA #10458).

Sincerely,

Gail Visentin
Director Passenger & Cargo Operations

Mr. Arthur Pugsley-EOEA No. 10458
100 Cambridge Street
20th Floor
Boston,MA 02205

Dear Mr. Pugsley:

April 22,1999

The Metropolitan Boston Building Trades Council, AFL-CIO representing 35,000 men and women is writing today in full support of the Massachusetts Port Authority's Airside Improvement plan for Logan International Airport. The Building Trade Unions firmly believe this project is necessary to reduce delays, improve the quality of life of our members and provide much needed employment opportunities.

Delays at Logan are consistently among the worsts in the U.S. These delays are not only inconvenient, they are costly. In 1998 delays at Logan cost airline and their passengers nearly $310 million. These losses ultimately affect the livelihood of many working men and women as it impedes the ability of Boston and the region to compete in a global economy. 78.1

A major component of the Airside Improvement project, Runway 14/32, provides significant noise relief for our members living in the highest impacted noise areas of East Boston's Bayswater, Revere's Beachmont and Winthrop's Court Road and Point Shirley as well as South Boston's Castle Island area. The new unidirectional Runway shifts 75,000 flights over water rather than over communities. It also allows noise impacts to be spread more equitably across communities. The proposed centerfield taxiway and other improvements would further enhance air quality by reducing aircraft idling and queuing on the airfield and reduce ground noise from taxing aircraft to adjacent neighborhoods. 78.2 78.3 78.4

With an annual economic impact of $5 billion, Logan International Airport is directly responsible for creating more than 15,000 jobs in this area, many of which are the hard working men and women of the Trade Unions.

It is therefore, without reservation, the Boston Building Trades Council, AFL-CIO wholeheartedly support's Airside Improvements at Logan Airport and looks forward to the projects approval.

Thank you for your attention to this matter.

Sincerely,

Joseph W. Nigro,Jr
Secretary Treasurer/General Agent

LETTER 79

Testimony for the Federal Aviation Administration with comments submitted pursuant to MEPA by Daniel A. Wolf, President of Cape Air/Nantucket Airlines
April 7, 1999

John Silva, Federal Aviation Administration

Arthur Pugsley, Massachusetts Environmental Policy Act

Mr. Moderator, my name is Daniel Wolf. I am the founder and President of Cape Air/Nantucket Airlines. We provide year round service between Boston, Cape Cod and the Islands of Martha's Vineyard and Nantucket. In addition, we are the only year round air service provider to many of the remote communities we serve. Our passengers rely on access to Logan International Airport. We fly approximately 150,000 passengers between Boston and the Cape and Islands each year. In the summer months a large proportion of these passengers are summer visitors connecting from other flights. It is important to emphasize that an equally large percentage of our passengers are residents and business people who need to reach Logan for travel, business and medical necessity.

I am a pilot and my strength is aviation. In fact, I dedicated the last 20 years of my life to the airline industry. A decade ago I founded Cape Air. Although they are not present, sitting with me are the other 400 employee owners of Cape Air who have worked tirelessly to make Cape Air the largest independent regional airline in the country. Today I speak for them and the passengers who depend on us.

We state very simply that construction of proposed runway 14/32 makes perfect aviation sense. Currently Logan Airport has the dubious distinction of being one of the top airports in the country in terms of aircraft delays

79.1

The primary reason for this is very simple. Under certain wind conditions the capacity at Logan Airport drops from 120 operations per hour to as few as 60. The result,

major delays, lost business time, missed connections and higher travel costs for both the industry and the passengers.

Although the proposed runway would increase efficiency and safety it would not increase the number of overall operations. I understand that is a major concern from a number of the communities in the area. 79.2

Another issue of course is noise. Once again aviation sense must come into play here. The proposed runway would re-direct the noise impact over the water thus away from some communities that are currently experiencing a disproportionate noise impact. 79.3

Alternatives to Logan Airport as a departure point have also been discussed. As someone whose business relies heavily on connecting passengers from Logan I need to point out that passengers arriving to Massachusetts from other parts of the world need Logan to make their connections to Cape Cod and the Islands. Air transportation markets are not automatically transferable. The use of alternative regional air transportation facilities should be encouraged but developing new air transportation markets with adequate ground transportation and other support infrastructure takes time. 79.4

We do encourage and support a regional approach to alternative regional air transportation issues. In fact, in an ongoing effort to pull some of our traffic out of Logan Airport, Cape Air provides service to New Bedford and Providence and invests considerable time and money in supporting the operation of the New Bedford Airport. 79.5

Such efforts should not be at the expense of the ongoing safety and effectiveness of the operations at Logan.

We believe that Massport has done a thorough job of evaluating the range of delay reduction tools outlined in Alternative 1A of the Draft Environmental Impact Statement filed with the MEPA Unit of the Executive Office of Environmental Affairs. Implementing the outlined improvements will allow the airport to operate at maximum efficiency regardless of wind direction. 79.6

LETTER 80

Secretary of Environmental Affairs
Attention: MEPA Unit
Mr. Arthur Pugsley-EOEA #10458
100 Cambridge St. 20th floor
Boston, MA 02202

RE: Draft Environmental Impact Report for the Logan Airside Improvements Planning Project

Dear Mr. Secretary:

For ten years Cape Air has been the critical air link between Logan International Airport and several Massachusetts communities. Currently we provide year round scheduled air service from Logan, New Bedford Airport, and T.F. Green Airport in Rhode Island to Cape Cod and the Islands of Nantucket and Martha's Vineyard. Access to Logan is critical to the communities we serve. This year Cape Air will transport more then 150,000 passengers between Logan Airport and Cape Cod and the Islands.

Cape Air actively supports Massport's efforts to improve the safety and efficiency of Logan operations. For the past three years I have participated in the environmental review of this project. I attended nearly all of the Airside Review Committee meetings and provided economic and operational data on our company for use in technical analysis of delay conditions, the assessment of alternatives and the development of case studies. Prior to my participation in this project I was a member of the Second Airport Commission charged with assessing the Commonwealth's needs and opportunities for creating a second major airport. As an airline president as well as a pilot, I have hands on, practical knowledge of the delay conditions at Logan and am familiar with Massport's efforts to address the Commonwealth's long-term air transportation needs. Based on these experiences I believe that Massport has undertaken a thorough and credible assessment of alternatives to reduce delays at Logan and at the same time is working to develop increased use of regional transportation facilities to help relieve pressure at Logan.

Logan's location on the waterfront and within city limits poses landside and airside challenges, but also offers the potential environmental benefits of moving air traffic over water. Logan experiences wind conditions that severely reduce Logan's capacity from 120 operations an hour to 90 or as low as 60 per hour. I agree with Massport's analysis which indicates the proposed airside improvements would both

80.1

80.2

80.3

equitably redistribute noise and at the same time shift existing noise over water and away from affected communities.

In Alternative 1A, Massport proposes 14/32 as a unidirectional runway for this purpose. This plan also includes taxiway improvements and reduced approach minimums. Massport's analysis demonstrates that these actions will have meaningful delay reduction results without causing negative environmental impacts on the surrounding communities. 80.4

We are pleased that Alternative 1A does not include peak period pricing. Massport's analysis demonstrates that peak hour pricing would not be effective in reducing current or projected delays at Logan. The DEIR/S demonstrates peak period pricing would not address delays caused by wind conditions that are most effectively helped by Runway 14/32. Massport demonstrates that peak period pricing will not address delay conditions at Logan. This is particularly true since delays are due to adverse wind conditions and not a result of airline over-scheduling. 80.5

The DEIR/S documents the negative impact peak period pricing would have on Cape Air and the remote destinations we serve. Peak period pricing would increase our landing fees by more then 1000%. We could not absorb a cost increase of this magnitude. Our response would have to be a drastic reduction or elimination of service to Logan Airport. This would have a direct impact on the 400 Massachusetts residents we employ and the hundreds of thousands of passengers, businesses and institutions we serve. Loss of air service to the region would mean staggering economic losses for the region's tourism industry, the Cape's emerging high technology sector and the countless other businesses that rely on air service.

In addition, Cape Air strongly supports the communities we serve in a variety of ways including low cost medical flight service to Boston from our remote destinations. With peak hour pricing not only would the communities lose that benefit but since we are the only airline providing air service to the town of Provincetown that community would be severely impacted. 80.6

Compounding the economic and public welfare issues are the resulting environmental impacts from adding 450,000 passengers we carry to already congested roadways including the Southeast Expressway, Route 3, and Route 6.

The often cited claim that carriers such as Cape Air are the major cause of delays at Logan is not substantiated by the extensive delay modeling and analysis completed for the DEIR/S. This analysis concludes that cape Air's operational characteristics limit the impact on Logan delays. Since Cape Air's contribution to the delay problem at Logan is relatively minor, the elimination of Cape Air's operations by the use of peak hour pricing brings with it many negative consequences without any significant commensurate benefit to delay reduction.

Logan is an important resource to all New England communities. Political considerations have dominated the public discussion of the DEIR since it's release in February. While important, these political considerations should not obscure the operational and environmental benefits embodied in Massport's preferred alternatives.

If viewed objectively, the analysis contained in the DEIR can lead to actions that will improve the safety and efficiency of operations at Logan and thereby serve the best interests of the Commonwealth. It would be unfortunate if we squandered this 80.7

opportunity which would not only improve the efficiency and safety of Logan Airport, but also produce beneficial environmental results.

Thank-you for the opportunity to comment.

Daniel A. Wolf
President, Cape Air

Letter 80

Section 4.5 of the Supplemental DEIS/FEIR provides an analysis of a PPP exemption program designed to protect services to small communities that are most reliant on Boston (Logan Airport) for access to the national air transport system. The analysis examines the impact that an exemption program would have on the delay reduction benefits associated with PPP. It concludes that an essential level of air service in the peak period can be exempted from the peak period surcharge without a material impact on the delay reduction benefits. This exemption program includes all the Cape Cod communities currently served by Logan Airport, as well as other small communities in New England.
80.7	Alternatives	Preferred Alternative	...the analysis contained in the DEIR can lead to actions that will improve the safety and efficiency of operations at Logan and thereby serve the best interests of the Commonwealth.	Comment noted.

CHAMBER OF COMMERCE

LETTER 81

Boston, MA 02202

Dear Secretary Durand:

I have represented Cape Cod business interests on the Airside Review Committee (A.R.C.) for the past three years.

The business community on Cape Cod strongly supports the Logan improvement program as outlined in MassPort's plan submitted to you for MEPA review.

As you know, we here on the Cape and Islands have developed an economic development strategic plan that has as its fundamental purpose a balance between environmental concerns and the development of more stable year round jobs.

As part of our effort we have endeavored to stretch out our tourism season by using more sophisticated marketing techniques aimed at a target market. We also are augmenting this effort with a recruitment initiative designed to attract more technology companies to locate here on Cape Cod.

In order to be successful we need reliable on time air service.

Our international visitor market is growing and this market alone requires efficient reliable connections to our Cape and Islands Airports.

As a member of the A.R.C. Committee I participated in the numerous working sessions and came away with the belief that the MassPort plan including runway 14/32 is essential to our economic well being. 81.1

Additionally, as I suggested and pressed for early on, the use of peak period pricing is not a workable solution at Logan and it would absolutely devastate our small carriers based on Cape Cod. 81.2

The MassPort staff and the community activists basically agree that Cape Air would essentially be put out of business by the use of peak period pricing.

The business community on Cape Cod urges approval of MassPort's overall plan to reduce delay at Logan with the taxiway improvements and the construction of runway 14/32. 81.3

Sincerely,

John O'Brien
Chief Executive Officer

EOEA #10458

Dear Sirs:

On behalf of the Cape Cod Economic Development Council (CCEDC) I would like to comment on the Draft Environmental Impact Report/Statement (DEIR/S) for the Logan Airside Improvements Planning Project. The CCEDC is the economic development arm of Barnstable County and, as such, is responsible for promoting policies in support of a year-round economy for the Cape. The Council consists of eleven private sector representatives and three representatives of local government.

The economic and environmental well being of Cape Cod's residents and businesses depends on continued safe and efficient air transportation access to Logan. Logan airport is a vital link to the region for visitors that support the Cape's tourism industry. Reliable air transportation access to Logan is also a component in public and private efforts to diversify the regional economy and create quality year-round employment opportunities for residents.

The Council believes that Alternative 1A as presented in the DEIR/S provides the most direct and effective actions for controlling delays and increasing operating efficiency. The preferred alternative would address weather-related conditions that account for the vast majority of delays at Logan. It would also result in a greater number of overwater operations and increase Massport's ability to achieve community noise goals. 82.1

Regarding peak pricing, the Council recognizes that Massport has conducted a thorough assessment of delay reduction benefits of peak period pricing, as well as the impacts on air carriers to the region and the regional economy. Through this assessment Massport has concluded that peak period pricing would not be an effective response to current or projected delay conditions at Logan.

The Council strongly opposes the imposition of peak period pricing at Logan Airport at any time. Peak period pricing would unfairly penalize the carriers providing service to Cape Cod, even though it has been demonstrated that the smaller aircraft used by those carriers have a negligible impact on delays because of their use of alternative runways. The Council notes Massport's finding of the "real possibility" that peak period pricing could put carriers serving this region out of business. 82.2

For the communities of the Outer Cape, the loss of air carrier service would fundamentally threaten the health and safety of residents by removing a critical community transportation resource. Cape Air currently provides a medical care flight service that many residents rely on. For these residents, the closest ambulance drive is an hour away to Cape Cod Hospital and two-and-a-half hours away to Boston. 82.3

In addition to staggering economic and health and safety impacts, peak period pricing would also generate harmful environmental impacts. The resulting loss of air transportation would force more cars onto local roadways, which are already stressed beyond capacity during the summer season.

Thank you for the opportunity to comment on the Logan DEIR.

Sincerely,

Daniel Dray
Administrator
Cape Cod Economic Development Council

CHARLESTOWN BUSINESS ASSOCIATION

LETTER 83

April 23, 1999

Secretary of Environmental Affairs Robert Durand
Executive Office of Environmental Affairs
100 Cambridge Street, 20th floor, Room 2000
Boston, MA 02202

Attention: MEPA Unit, Arthur Pugsley

RE: Logan Airside Improvements Planning Project - EOEA #10458 DEIS/R

By Facsimile: (617) 727-1598

Dear Secretary Durand:

On behalf of the Charlestown Business Association, I wish to express our concern over the application made by the Massachusetts Port Authority (Massport) and the Federal Aviation Administration (FAA) to develop a new runway, 14/32, at Boston-Logan International Airport (Logan) in Boston, Massachusetts and over the information contained in the DEIS/R which supports its development. We believe that the proposed runway expansion carries deep impacts on the quality of life in the surrounding communities and in Charlestown, in particular, because of noise and increases in air traffic. The proposed runway 14/32 has the potential to negatively impact and damage our businesses as well.

It is for these reasons that the Board of Directors of the Charlestown Business Association voted recently to oppose development of the new runway, 14/32, at Logan. The Charlestown Business Association (CBA), founded in 1986, is an organization of approximately 180 members, including office, industrial, retail, restaurant, and recreational businesses and non-profit institutions, most located within Charlestown itself. The CBA gives businesses a voice in the Charlestown community, and its mission is to better the community through commerce.

Our reading of the Draft Environmental Impact Statement/Report Volume 1 did not alleviate our concerns about impacts of the proposed runway on our community and on the impacted communities. The following are particular areas of concern.

1. **Need for a Regional Network**. A basic premise of the DEIS/R is that " The transportation services provided at Logan -- both passenger and air cargo- are essential to the economic success of the entire New England Region." (ES-6). By using the word "essential", the proponents ignore the fact that Logan is but one element in the regional transportation network. By using the word "essential", they focus only on increasing capacity at Logan rather than on seriously analyzing the regional capacity and growth potential of the network of airports at Worcester, Hanscom Field, T.F. Green Airport, RI, Manchester, NH, and Bradley International Airport, Hartford, CT. 83.1

2. **Need for Runway by Runway Numbers**: The DEIS/R did not appear to list the increases in numbers of arrivals and departures runway by runway, that is by direction, under the various alternatives. It is not possible to determine the increases or decreases in activity level with construction of R14/32. However, earlier reports presented to Massport's Airside Review Committee on April 2, 1997, for the Environmental Impact Study on Logan Airport Improvements show the changes in arrivals and departures runway by runway under the R14/32 build and no-build scenario. Why was this same information not readily available in Volume 1 of the DEIS/R? From a Charlestown point of view, the 1997 document certainly makes the case for our not supporting construction of R14/32. 83.2

3. **Delays:** The information on delays does not indicate the number of delays caused by weather-related problems at other airports For example, many of us have experienced winter delays when connecting flights are delayed by snow at other distant airports. What part of the total delay is caused by such weather problems elsewhere? 83.3

4. **Soundproofing Mitigation:** Massport's willingness to soundproof buildings should not be used to support arguments for expansion of Logan runways. For businesses that operate out of doors and for residents who use their outdoor spaces around their homes, how can you soundproof the out-of-doors? There is a loss in property value attributable to the increase in noise and air traffic that cannot be mitigated by soundproofing. Where is this loss in property value given attention in the DEIS/R? 83.4

5. **Is Runway 14/32 always going to be uni-directional.** While the uni-directional R14/32 as proposed has negative impacts on the Charlestown community and its business community, we wonder how many years it will be before Massport makes the argument for a two-directional runway 14/32. A two-directional runway would have a far more devastating environmental impact on Charlestown than the uni-directional runway, which we oppose as it is proposed. 83.5

We recognize the importance of the airport to the regional economy, but we side with the quality of life and economic viability issues which are "essential" to us. We believe that Massport and the FAA must take a regional approach to solving the airport growth and usage problems, among other issues cited above. Until that happens, we can find little, if anything, in the proposed R14/32 plan that we support. 83.6

Sincerely,

Carol Bratley

Code	Topic 1	Topic 2	Comment	Response
83.1	Regional Transportation	Regional Airports	...[the proponents] focus only on increasing capacity at Logan rather than on seriously analyzing the regional capacity and growth potential of the network of airports at Worcester, Hanscom Field, T.F. Green Airport, RI, Manchester, NH, and Bradley International Airport, Hartford, CT.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR provide an evaluation of the regional airports at T. F. Green/Providence, Manchester, and Worcester Regional and their potential impacts on Logan Airport. Hanscom Field is the region's premier general aviation facility and accommodated over 180,000 aircraft operations in 1998. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to the growth pressures at Logan Airport. Nevertheless, the proposed Logan Airport Airside Project is necessary and provides clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport.
83.2	Delay	Model	...earlier reports presented to Massport's Airside Review Committee on April 2, 1997, for the Environmental Impact Study on Logan Airport Improvements show the changes in arrivals and departures runway by runway under the R14/32 build and no-build scenario. Why was this same information not readily available in Volume 1 of the DEIS/R?	Arrivals and departures by runway end for all future fleets and project alternatives were included in Appendix H of the Draft EIS/EIR. The same information for the 2015 37.5M High RJ fleet is included in Appendix C of the Supplemental DEIS/FEIR.
83.3	Delay	Model	The information on delays does not indicate the number of delays caused by weather-related problems at other airports...What part of the total delay is caused by such weather problems elsewhere?	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.

Maxwell\LDN\7468\Docs\Reports\Remunbered Comments & Responses\Interest Group 1 1.doc

Code	Topic 1	Topic 2	Comment	Response
83.4	Noise	Sound Insulation	Massport's willingness to soundproof buildings should not be used to support arguments for expansion of Logan runways...how can you soundproof the out-of-doors?	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.
83.5	Alternatives	Runway 14/32	Is Runway 14/32 always going to be uni-directional.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only (*i.e.*, all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from the Runway 14 heading out over Boston Harbor). State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of the Runway 14. The location of the Hyatt Hotel and Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to the Runway 32. The unidirectional limitations of Runway 14/32 allow maximum use of over-water operations and thereby limit operational impacts over residential areas. To strictly reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. Refer to Section 8.7 of the Supplemental DEIS/FEIR Draft Section 61 Findings, and the discussion in Section 8.5 of the Supplemental DEIS/FEIR regarding enforcement of unidirectionality of Runway 14/32.
83.6	Regional Transportation	Regional Airports	We believe that Massport and the FAA must take a regional approach to solving the airport growth....	Logan Airport is part of a regional system of airports that includes T.F. Green/Providence, Worcester Regional and Manchester airports. Massport has long recognized that service development and increased passenger traffic at these airports are an important part of the region's long-term strategy to accommodate passenger and activity growth. Massport has actively encouraged the development of regional airports and use of other options, including high-speed rail to Logan Airport's largest market, New York. Regional service was examined in Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. This analysis supports the conclusion that greater use of the regional airports will provide passengers within the service area of such airports with a viable alternative to Logan Airport. Since demand within Logan Airport's primary service area will remain strong, the improvements at other regional airports will not eliminate the need for airside improvements to be implemented under the Preferred Alternative at Logan Airport.

LETTER 84

To: Robert Durand
Secretary of Executive Office of Enviromental Affairs
April 22, 1999

Dear Robert,

The Chelsea Waterfront Association is a non-profit, non-partisan, neighborhood improvement association dedicated to giving its members a voice in the policies that affect the Chelsea waterfront area. The purpose of the association is to maintain and enhance the quality of life in our neighborhood and our City through information, education, advocacy, self-help, and activism as well as through cooperation with other civic organizations. The organization represents hundreds of residents in the Chelsea Historic Waterfront District who are vehemently opposed to the runway proposal.

The Draft EIR/S contains many discrepancies and inadequacies and fails to address our concerns regarding the health impacts of a new runway on our neighborhood. For the reasons detailed below, and we are sure many more, we encourage you to find this document inadequate and respectfully request the FAA withdraw support for the project.

It has come to our attention that the new runway will allow for a tripling of flights over our neighborhood. Enough is enough! Our health is currently jeopardized by hundreds of thousands of vehicles travelling over the Tobin Bridge on one side, airplanes arriving and departing over heads, a salt pile on another side, an oil tank farm 45 feet from our boundary, and an onslaught of heavy truck traffic associated with all of them. We can not accept another assault on the quality of life in our neighborhood. 84.1

First and foremost, the method used to measure the noise impact is inaccurate. We have learned through numerous conversations with Massport and the FAA that the yearly average noise level "predicted" by the integrated noise model has consistently underestimated the actual noise levels affecting the Waterfront area. The use of the same model to predict the impact of the dramatic increase in flights over our heads will surely underestimate it as well. We also feel that soundproofing would do little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park and does not help us as we try to enjoy a sea breeze through open windows in the summertime. 84.2

We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue. Chelsea is a City of immigrants - always has been and always will be. We believe it is not coincidence that we have been targeted with the brunt of the noise impact 84.3

of the proposal. But what about the other impacts on the low income, minority residents of Chelsea? Nothing was done in this report to address the Environmental Justice issue regarding the negative health impacts on us. In this sense the document also seems woefully inadequate. 84.4

Naturally we were upset to learn that other alternatives such as a thorough regionalization plan including ALL other options was not included. Additionally, we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered because 115 operations per hour understates the true benefit of this alternative. Why wasn't a second airport examined? 84.5 84.6

While Massport refuses to admit the Airside Improvement Planning Project will expand capacity at Logan, Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations. Nothing has been done to determine the traffic impacts associated with expected increases in operations associated with this proposal. Chelsea can expect nothing but a dramatic increase in airport related heavy truck activity. The effect of these trucks on health is well documented by the EPA, yet the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea. 84.7 84.8

Chelsea is undergoing a modern day renaissance. We have had to fight harder than most to turn the City around. As this proposal is being examined we are watching the value of our homes rise. We have a new school system and a local government committed to undoing the past. We were recently honored as an "All America City," in recognition for our ability to address the problems confronting us. Our budget is balanced for the first time, and we are investing millions in our infrastructure in order to move forward into the next century. The proposed expansion of Logan Airport is the single largest threat we face. If this runway is built, years of hard work could be undone in an instant.

Sincerly,

Jeffrey Buck

President Chelsea Waterfront Association

Letter 84
Chelsea Waterfront Association
Jeffrey Buck, President

Code	Topic 1	Topic 2	Comment	Response
84.1	Noise	Runway Use	...new runway will allow for a tripling of flights over our neighborhood.	PRAS noise goals are based on the fact that DNL levels above 75 dB are considered unacceptable for residential land use and that DNL levels above 70 dB are also excessively high and should be reduced if feasible. PRAS recommendations are thus designed to shift operations off of runways where these high levels still exist – primarily in Winthrop and to the north of Logan Airport in East Boston and Revere. No one in Chelsea or Charlestown currently experiences noise that is this high.
84.2	Noise	Model	...the method used to measure the noise impact is inaccurate. ...the integrated noise model has consistently underestimated the actual noise levels affecting the Waterfront area.	We are not aware of any data that show an underestimation of the noise in the Chelsea waterfront area by the model used in this study.

M:\wield\LDA\7468\Docs\Reports\Recirculated Comments & Responses\Interest Group 1 1.doc

Code	Topic 1	Topic 2	Comment	Response
84.3	Noise	Sound Insulation	...also feel that soundproofing would do little to mitigate the noise impact. Sound insulation does not protect our children when they are playing in the park and does not help us as we try to enjoy a sea breeze through open windows in the summertime. We are also disturbed about the DEIR/S' lack of consideration of the Environmental Justice issue.	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals. The Environmental Justice analysis was expanded for the Supplemental DEIS/FEIR. Low-income and minority populations were defined in accordance with Federal Executive Order 12898, the U.S. DOT Final Order, and the Council on Environmental Quality's guidance on environmental justice. In addition, the analysis of low-income populations was expanded to include households at 150 percent of poverty level. This analysis found that there is no high and adverse disproportionate impact to low-income and minority populations caused by the Preferred Alternative. Adverse impacts are not predominately borne by low-income or minority populations. Only 21 percent of the population within the 65 dB DNL contour for the Preferred Alternative is minority, compared to the Suffolk County minority population of 38 percent. Less than two percent of the population within the 65 dB DNL contour for the Preferred Alternative has a household income less than 150 percent of poverty level. The additional area within the 65 dB DNL noise contour associated with the Preferred Alternative includes a predominately Hispanic neighborhood in Chelsea which is predicted under worst case assumptions to experience an increase of 0.6 dB or less. Under FAA standards, this change is not a significant adverse impact. The minority and low-income populations in South Boston and East Boston affected by the Preferred Alternative 65 dB DNL contour are almost identical to the No Action Alternative. The 65 dB DNL contour for the Preferred Alternative does not extend into Jamaica Plain, Roxbury and the South End. Mitigation of the increased noise within the 65 dB DNL contour will be provided to affected communities in the form of residential sound insulation. A discussion of the Environmental Justice analysis is presented in Section 6.8 of Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
84.4	Regional Transportation	Regional Airports	...we were upset to learn that other alternatives such as a thorough regionalization plan including ALL other options was not included.	The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives. Massport advocates increased use of the regional airports and high-speed rail services, in addition to construction of Runway 14/32 and the other airside improvement projects at Logan Airport, as a comprehensive plan for ensuring an efficient and balanced regional transportation system. As the analysis in Chapter 2 indicates, these off-airport alternatives are expected to reduce aircraft traffic growth pressures at Logan Airport, but they will not eliminate airside delays at Logan Airport that occur because of a third operating runway during periods of northwest winds. The Preferred Alternative, which specifically addresses this deficiency, is necessary and provides clear benefits at current aircraft traffic levels. These benefits will only increase in the future, even as developments at the regional airports and high-speed rail to New York act to reduce the rate of future growth at Logan Airport.
84.5	Alternatives	Peak Period Pricing	...we believe a peak-hour pricing plan analyzing the delay effects of 80, 90, and 100 operations per hour should have been considered....	The Airside Project analysis of PPP examined an operations threshold of 110 operations per hour, which is already below Logan Airport's normal operating capacity of 120 operations per hour. There is no legitimate operational justification for imposing a peak period surcharge at an operation level significantly lower than Logan Airport's normal operating capacity which is achieved 80 percent of the year without any delays. Even at 75 operations per hour, Logan Airport would be subject to delays from northwest wind conditions. The Airside Project analysis in the Draft EIS/EIR and in the Supplemental DEIS/FEIR indicates that, with the Preferred Alternative, Logan Airport can accommodate existing and foreseeable future levels of demand without imposing a drastic administrative restriction to artificially revise Logan Airport's existing capacity.
84.6	Regional Transportation	Regional Airports	Why wasn't a second airport examined?	Comment noted.
84.7	Alternatives	Demand	...this project must be considered and evaluated as stimulating growth in aircraft operations.	The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations.
84.8	Ground Transportation	Access to Logan Airport	...the Draft EIR/S does not address the negative impacts of more truck traffic and congestion on Chelsea.	The Airside Project does not result in additional demand for ground access services. Cargo activity at Logan Airport changes from year to year. Despite strong economic growth over the last few years, cargo operations at Logan Airport increased by less than two percent in 1999 and actually declined by 1.2 percent in 1998. Since cargo operations account for only two percent of aircraft activity at Logan Airport and no additional truck traffic is expected to be generated.

Dear Secretary Durand,

As Co-Chair of the Community Advisory Committee to Massport (CAC), I am submitting the following document representing the CAC consultant's opinions on the Massachusetts Port Authority's Draft Environmental Impact Statement on the Logan Airport Airside Improvement Planning Project (DEIS/DEIR).

The CAC concurs with the consultants' conclusion that the DEIS/DEIR should be found inadequate.

Sincerely,

Anastasia Lyman

Appendices	(Appendix A: "Alternatives Paper," Appendix B: "Analysis of Odor Complaints," and Appendix C: "Efficiency of Utilization of Facilities")		

Executive Summary

A. Introduction

- Logan was constructed into a residential setting. Massport for too long has been allowed to take a segmented approach to Logan's development, arguing that landside projects are designed to accommodate ground passenger handling; airside improvement projects are designed to accommodate aircraft handling; that neither generates traffic; and that Massport has no control over passenger and cargo growth. 85.1

- The Airside Improvement Planning Program is a short-range and limited response to a major concern about long-term trends, future growth, and increasing impact. The prospect is for more and more passengers, more and more aircraft operations, and a greater impact on the surrounding communities. 85.2

B. Addressing the Scope & Regulatory Requirements

B.1 Notice of Project Change

- **The Secretary and FAA should require Massport to change the base year to calendar year 1998, to revise all presentations in the DEIS/DEIR to reflect that change, and to extend the planning period to 2020 from 2010 with concomitant revisions in projected levels of activity and impact, and to republish the DEIS/DEIR.**

- The passage of over five years from the "base year," and the changes in activity levels at Logan since that date, should require that 1998 constitute the "base year" for this Planning Project. 85.3

- The minimal 15-year planning horizon for the project should be extended to a 20-year planning horizon, to 2020, in order to examine potential impacts and benefits of the project proposals over a reasonable period.

- The FAA data on delays shows that the delay situation at Logan has improved since 1993 and is essentially in equilibrium, as assessed by the FAA. 85.4

- The Airside delay model (DELAYSIM) used hourly weather observations from 1981-1990. Weather patterns have changed significantly within the last five years due to effects from El Nino and La Nina. A new 10-year average should be constructed and used. 85.5

B.2 Requirements of ENF Certificate

❖ The items listed below were not specifically addressed in the DEIS/DEIR:

1. Discussion of diversion of cargo to off-airport alternatives 85.6
2. Considering the off-airport alternatives as a separate scenario evaluated during the DEIS/DEIR 85.7
3. Failure to consider Hanscom Field in Bedford as a reliever airport for general aviation operations, origin/destination regional non-jet traffic, and short-haul origin/destination jet traffic. 85.8
4. Considering the development of a second major airport, in discussion of environmental justice 85.9
5. Detailing of the existing delay at Logan including delay derived directly from wind/weather and indirectly from delay at other airports 85.10
6. Documentation of history of PRAS and problems implementing it 85.11

C. Growth & Long-Range Planning Issues

❖ **The Secretary of Environmental Affairs should determine that significant planning deficiencies exist in the DEIS/DEIR that must be addressed. The DEIS/DEIR should be found inadequate, and a new Draft document should be required.** 85.12

❖ It seems inevitable that Logan Airport will experience growing congestion, and with that congestion will come increasing pressure for additional measures to reduce it. The proposed projects provide only limited and interim relief to whatever aircraft operating delays at Logan Airport are caused by or as a result of the airfield configuration. The delay problem as modeled and represented by Massport will get worse. 85.13

❖ There is no plan or program to deal with long-term growth at Logan, which will soon overwhelm any interim benefits of this project. There are measures that could be instituted to effectively address transportation in eastern New England, but there is no discussion in this document. There must be a plan and a program to shift some current, and most growth in, air traffic and passengers away from Logan. Major expansion of service at and capacity of other airports must be undertaken. 85.14

❖ Massport projects air traffic operations to increase substantially over the project planning period. A conservative projection is a 20% increase in total operations over the next decade. A more important assessment is the projected increase in "equivalent jet operations," which takes into account the substantial increase in noise impact of a nighttime operation compared to a daytime operation. The projected growth in "equivalent jet operations" approaches 50% over the next decade. 85.15

- Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan directly, because of delay reduction. 85.16

- This project and landside projects at Logan are interdependent, and both will increase capacity and stimulate demand. 85.17

- Massport's proposal to increase the percentage of passengers accessing Logan Airport who do so in high-occupancy vehicles falls far short of absorbing the full projected increase in passenger ground access requirements, even over the limited planning period. 85.18

D. Environmental Issues

D.1 Noise

- There can be no guarantee of "unidirectional use" of Runway 14/32. 85.19

- We believe airfield operations are unlikely to attain, and even less likely to sustain, the progress toward attainment of PRAS goals that Massport projects. The increasing impact of Logan on the communities in the coming decade stresses the need to reduce dependence on and preference for air travel and Logan in particular. 85.20

- PRAS goals were established many years ago, under considerably different circumstances, and may well no longer represent community consensus. The Community Advisory Committee (CAC), however, declined to move for a review and possible modification of the PRAS goals. 85.21

- Most of the projected increases in passenger demand will be met by increased operations of the "passenger jet" fleet. This of course is the fleet that creates the noise impacts at Logan and elsewhere. 85.22

- There will be significant increases in overflights of East Boston, Chelsea, Everett and other "15/33" communities, and of South Boston, South End, Roxbury and other Runway 27 communities. 85.23

- Massport overstates the benefit of further conversion to Stage 3 aircraft on future noise levels around Logan Airport. 85.24

D.2 Night-time Operations

- The number of nighttime jet operations can be expected to double within the foreseeable future under conservative forecasts. The noise impacts of this increase are huge, and are not mitigated by use of Stage 3 aircraft since night operations are now required to be only of that type. 85.25

- An alternative that should be considered is the creation of a cap on nighttime operations pursuant to FAR Part 161. 85.26

D.3 Flight Tracks

- A significant number of flights did not conform to the published departure tracks, and re-crossed the shoreline over Hull and were also below 6,000 feet. 85.27

- The FAA and the airlines have not adhered to the flight paths established for Runway 27 departures.

D.4 Soundproofing

- "Soundproofing" is not the answer. Acoustical treatment of selected residences cannot fully mitigate for the impacts of increased overflights and increased ambient noise. We disagree with the statement "After sound-proofing to mitigate impacts within the 65 YDNL Contour, the full-build alternatives provide net long-term benefits." 85.28

- Concerns about Massport's residential "soundproofing" program include the pace of the program, the failure to provide air conditioning in conjunction with the "soundproofing" program, and the small number of dwelling units that are eligible for the program. 85.29

- FAA Order 5100.38A makes ineligible for AIP funding any non-related code-required building improvements necessary to accommodate acoustic treatment improvements. This may impose significant burdens on some property owners. 85.30

D.5 Air Quality

- The proposed Airside Improvement Project provides minimal long-term air quality benefits. Changes in air quality associated with the proposed project are likely to be undetectable, with the exception of adverse odor impacts. 85.31

- There is potential for adverse odor impacts in certain areas proximate to the airport, as a result of this project. Changes in odor impacts are most likely to occur in the Jefferies Point neighborhood from takeoffs on Runway 14. 85.31 (cont.)

- The odor modeling and odor impact assessment procedure is inadequate. 85.32

D.6 Dispersion Modeling Results

- For all modeled contaminants other than VOCs, the difference (if any) among Airside Improvement Project alternatives is much less significant than the projected growth of emissions over time. 85.33

- Massport should have used the ten-year hourly average meteorological input for the air quality dispersion model, and should be required to rerun the dispersion model for all of the conditions modeled for the DEIS/DEIR. 85.34

D.7 Endangered Species - Upland Sandpiper

- A program is required to compensate for impacts to the nesting habitat on Logan Airport of the state-listed endangered upland sandpiper. The suggested program appears highly speculative as described. Massport should be required to set forth the resolution with NHESP in the DEIS/DEIR. 85.35

D.8 Construction Impacts

- Massport has failed to demonstrate how fugitive dust emissions from construction operations on the airfield will be controlled during winter months. 85.36

- Shortcomings of the Massport construction noise analysis include its failure to address the matter of pure tones and of impact noise (*i.e.*, paving breakers and hoe rams), and the failure to separate out and separately analyze nighttime construction noise levels against nighttime ambient levels. The noise criteria applied by Massachusetts Department of Environmental Protection are applicable to this project. 85.37

D.9 Cumulative Impacts

- We disagree with the statement "After sound-proofing to mitigate impacts within the 65 YDNL Contour, the full-build alternatives provide net long-term benefits."" 85.38

- Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan. 85.39

D.10 Relationship to the GEIR

- The planning period is inadequate, and should be extended to 2020. There is no plan or program to deal with long-term growth at Logan, which will soon overwhelm any interim benefits of this project. 85.40

- Delay does not appear to be a major problem at Logan, based on Massport's two-year history of inaction and on FAA analyses. 85.41

- **The Secretary of Environmental Affairs should determine that significant planning deficiencies exist in the DEIS/DEIR that must be addressed. The DEIS/DEIR should be found inadequate, and a new Draft document should be required.** 85.42

D.11 Relationship to Other Logan Projects

- This airside project and the landside projects at Logan are interdependent, and both will increase capacity and stimulate demand. 85.43

E. Delay

- There is no discussion in the DEIS/DEIR on the selection of the model for estimating delay. The models used including FLAPS and DELAYSIM appear to have been developed exclusively for analysis of Logan. Background information on the development of these models is not presented, as required by FAA. 85.44

- Massport did not use the FAA-approved SIMMOD model for the airport simulations, but chose to develop its own model for estimating delay. 85.45

- The delay hours projected by Massport are the artifacts of its own model, severely overstate the actual situation, and do not comport with the FAA's procedure for calculating delay at airports. Besides calculating every minute of potential delay associated with every scheduled flight, it fails to take into account normal flight cancellation activities by airlines. 85.46

- The DELAYSIM model should use as the leading criteria the highest capacity configuration and air traffic controller workload weighting approved by FAA ATC. This approach would be a more conservative approach and reflect historical operational selections by the FAA ATC personnel, instead of assuming attainment of PRAS goals can and will be an initial decision point. No data is presented to show recent improvement due to the availability of Enhanced PRAS (EPRAS). 85.47

- The report compares Massport's calculation of delay with FAA's calculation of delay. This comparison throughout the DEIS/DEIR is incorrect and misleading. 85.48

- The FAA data on delays cited elsewhere in this report shows that the delay situation at Logan has improved since 1993 and is essentially in equilibrium, as assessed by the FAA. From 1993-1997, delay at Logan as calculated by FAA, has decreased almost 36%. FAA reported delay for 1998 was 18% lower than 1993 levels. The DEIS/DEIR does not reflect this information. This reduction in delay has occurred without the implementation of any of the airside improvements proposed in this DEIS/DEIR. 85.49

- Modeled delay under the most optimistic Massport scenario will return to present levels within a very few years and increase after that. The stimulation of demand is not reflected in the annual hours of delay calculations. 85.50

- While peak hour capacity does not increase with construction of the runway, the additional runway will provide the controllers the option to use higher-capacity configuration more of the time. This ability is providing additional "throughput" of aircraft operations. 85.51

- The guise of constructing the new runway to reduce weather-related delays actually has the effect of increasing the all-weather capacity of the airport; thus allowing for additional throughput of aircraft operations.

F. Alternatives

- Massport has not met the requirements of the National Environmental Policy Act (40 CFR Part 1502 Environmental Impact Statements) that requires the DEIS/DEIR to "Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated." No discussion of "alternatives not considered in this DEIS/DEIR" was included. A reasonable person could expect the DEIS/DEIR alternatives to include the following: 85.52

  a. Development of a new airport
  b. Consideration of Implementing a High-Density Rule (Slots) 85.53
  c. Consider Implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions for Stage 2 and Stage 3 operations at Logan to provide noise relief to affected communities. A specific measure that could be considered is a cap on night-time operations. 85.54 85.55

F.1 Regional Airports

- The New England governors, the FAA, and the Federal Highway Administration must assist state government and the Boston Area communities in devising and implementing programs to ensure that Massport's numbers grow no larger, while not inhibiting normal beneficial economic growth of Eastern New England. The Airside Improvement Project must be viewed in this larger regional context. 85.56

- Massport argues that the growth in passenger traffic experienced at the Manchester, New Hampshire Airport and the T. F. Green Airport in Warwick, Rhode Island represents shifts of demand from Logan Airport. It is equally likely that the introduction to those two airports of low-cost carriers has stimulated overall regional air travel growth, the bulk of which has been absorbed at those two airports. 85.57

- If market forces are left to drive growth in traffic at those airports, growth at Logan will not be significantly constrained. Specific goals would have to be established, and a series of measures implemented to stimulate a substantial shift of traffic demand from Logan. 85.58

- The ENF Certificate dated November 22, 1995 cited that "the alternatives analysis must be broadened to include off-airport alternatives." Although Massport includes some off-airport options, the development of other obvious alternatives has not been reasonably discussed nor have the reasons for their elimination as options. 85.59

- The conclusion of the MAC Second Major Airport Study points out that long term considerations to meet increasing demand require that a second airport (either a greenfield airport and/or significant expansion of an existing airport) be an alternative to the improvements recommended. 85.60

F.2 Peak Hour Pricing

- Congestion pricing, peak-period pricing and techniques that base landing fees on functional categories relating to operations (landing or take-offs, weight (or size) of aircraft, and capacity to meet peak period demand could be particularly useful in reducing delays. Peak Period Pricing is but one form of economic incentive or control that should be considered in evaluating measures to reduce airspace and airfield congestion 85.61

- The basic assumption was made that peak period pricing needed to be revenue neutral, pertaining only to airfield revenue and airfield costs at Logan. This assumption resulted in impacts to airlines that operate small aircraft only. 85.62

- Consideration should be given to a quite different approach to addressing the efficiency of Logan Airport during peak operating periods and in carrying out its primary mission. 85.63

- Massport's model for peak hour pricing has chosen too narrow a definition of the regulatory criteria it must meet to establish a peak hour pricing structure. 85.64

- Massport chose a higher operational threshold (115 operations per hour) which underestimates the delay reduction capabilities of peak hour pricing. The range of options considered for Peak Period Pricing is insufficient. It is essential to introduce other economic factors into the decision process of the airlines, large and small. 85.65

- The option of utilizing "costing" (including peak period pricing) approaches for the purpose of delay reduction should be retained. It should be the first option selected for implementation, as a non-capital intensive, adjustable measure to move toward a goal. 85.66

F.3 Other Alternatives

- A shift away from air travel through reliance on other means of travel or communication is essential. Vigorous measures to foster and encourage this shift should be undertaken by State government in cooperation with Amtrak and telecommunications providers. 85.67

G. Benefit-Cost Analysis

- FAA legislation requires that airport sponsors conduct a benefit-cost analysis for capacity-related airport projects, particularly when the sponsor anticipates the need for $5 million or more in Airport Improvement Program grants. The DEIS/DEIR does not indicate the requirement of a benefit-cost analysis. 85.68

- There are no economic analyses of the noise impacts regarding the various alternatives. The noise-related costs and benefits should be addressed in economic analyses of activities that result in increases or decreases in aircraft noise. 85.69

- The development of the preferred alternative is anticipated to cost over $60 million. No indication of how the project is to be financed is provided in the DEIS/DEIR document. This information should be discussed as it may be relevant to the selection of alternatives. 85.70

H. Airfield Layout & Utilization

H.1 Runway 14/32

- Layout Option C for Runway 14/32 requires the FAA to issue a "Modification of Standards."

- Should the FAA decline the Modification of Standards, the possibility of constructing the runway, and/or the environmental impacts of constructing the runway, may change. If the runway cannot be so shifted, Option A or reducing the runway length would be the only viable options. Option A has a significant impact on Hyatt parking, as it would require a substantial reduction in that parking for which there appears to be no alternative. These eventualities are not thoroughly explored in the DEIS/DEIR. 85.71

- **The commitment to maintain Runway 14/32 as a unidirectional runway is clearly reversible.** 85.72

- Massport indicates that only regional and commuter aircraft will use the proposed runway. The Airport Reference Code (C-III) for the proposed runway includes the following aircraft types: Airbus A-320s, BAC 111s, Boeing 727s, Boeing 737s, Fokker F-28s, and MDC DC-9s. Therefore, large jets can and will use the runway. 85.73

H.2 Centerfield Taxiway

- The summary of advantages cited for the Centerfield Taxiway supports the community concern that the presence of the Centerfield Taxiway will make the use of the 4/22 runway combinations more attractive and therefore will tend to strengthen the bias of the tower toward use of those runways. Not only would this operate contrary to the goal of shifting operations from those runways, it would increase the tendency to stack aircraft in the northern section of the airfield. 85.74

I. Preferred Alternative

- Massport is not including Alternate 1 as the preferred alternative which according to its model provides the highest reduction in delay. Peak hour pricing is said to be not included because of current conditions but is represented as an administrative option that can be implemented later. However, Massport makes no commitment to ever using this capacity management tool. The rejection of peak period pricing by Massport is inappropriate, and ignores several salient factors. The peak period pricing option or an alternative congestion approach should be implemented immediately to gain its delay-reduction benefits throughout and beyond any construction period. 85.75 85.76

- Layout Option C for Runway 14/32 requires the FAA to issue a "Modification of Standards."" Should the FAA decline to do that, the possibility of constructing the runway, and/or the environmental impacts of constructing the runway, may change. These eventualities are not thoroughly explored in the DEIS/DEIR.

- There are adverse air quality impacts associated with construction of Runway 14/32 and the Centerfield Taxiway that are not sufficiently explored in the DEIS/DEIR. These include odor impacts especially in the Jefferies Point area, and potential construction dust problems. 85.77

- A major element of the proposal to mitigate impacts on the state-listed upland sandpiper, that of creation of a replacement habitat on Cape Cod, appears to ignore geography and is of questionable benefit. 85.78

- The commitment to maintain Runway 14/32 as a unidirectional runway is clearly reversible. That, and the signal this project sends that Massport continues to be committed to expansion of Logan Airport, are the two greatest concerns of the surrounding communities. 85.79 85.80

- Alternate No. 3 provides delay reduction without the build option. Alternate No. 2 provides significant delay reduction by allowing maximization of existing airfield capacity through the construction of a parallel taxiway. These two alternatives appear to be the most viable for the community. 85.81

Review Comments on Logan Airside Improvement Planning Project

A. Introduction

The need to accommodate the demand for air travel services to Boston and the region has continually conflicted with the residential concerns regarding noise, air quality, property value and quality of life issues. This conflict between Massport and the communities has been on-going for over four decades. While the Draft Environmental Impact Statement/Draft Environmental Impact Report (DEIS/DEIR) identifies the economic necessity of operations at Logan, it minimizes the fact that neighboring communities were well established prior to the development of Logan International Airport. The timeline of Logan's development, if documented, would place a responsibility on Massport to more closely consider how development of its property affects its neighbors. If Massport is taking responsibility for providing adequate air service to meet the region's growing needs and economy; then the DEIS/DEIR document should indicate a) what the long term (20 year) needs are, and b) how the alternatives considered meet these needs. 85.82 85.83

Logan Airport was developed in 1923, significantly after most development of residential communities surrounding the Airport property. Unlike many airports that are initially developed without encroachment of residential uses, Logan was constructed into a residential setting. The history of the airfield at Logan is noted in Appendix B but does not point out the residential development existing during the phases of development. 85.84

Massport for too long has been allowed to take a segmented approach, arguing that landside projects are designed to accommodate ground passenger handling; airside improvement projects are designed to accommodate aircraft handling; that neither generates traffic; and that Massport has no control over passenger and cargo growth. 85.85

There needs to be a reallocation of roles and responsibilities, a primary objective of which should be to significantly temper the adverse impacts of air and ground vehicle operations to and from Logan Airport. 85.86

B. Addressing the Scope & Regulatory Requirements

B.1 Notice of Project Change (Massport letter dated February 16, 1999 to the Secretary of Environmental Affairs on transmission of DEIS/DEIR document

It is now unlikely that the notice of availability of the Final EIS/EIR for the project will be published prior to the summer of 1999, nearly four years after the publication of the ENF. This project, initiated in 1995 with the filing of an ENF, uses 1993 as its "base year" for planning purposes and for comparison of impacts and benefits from 85.87

the proposed project. The passage of over five years from the "base year," and the changes in activity levels at Logan since that date, warrants and should require that 1998 and data therefrom constitute the "base year" for this Planning Project. A full year of records of activity levels, including flight activity, passenger levels, fleet mix, and delays, is now available from that year and should be used instead of the 1993 data.

The planning process to date has used a 15-year planning horizon, to 2010 from the 1995 date of filing of the ENF. 2010 is now only 11 years away and the minimal 15-year planning horizon for the project should be extended to a 20-year planning horizon, to 2020, in order to examine potential impacts and benefits of the project proposals over a reasonable period. 85.88

For these reasons, the Secretary and FAA should find the lapse of time significant, should consult with the Community Advisory Committee and others, and should receive comments on the Notice, as provided for in 310 CMR 11.10(8). The Secretary and FAA are urged to require the proponent, Massport, to change the base year for planning for the project to calendar year 1998, to revise all presentations in the DEIS/DEIR including the appendices thereto to reflect that change, and to extend the planning period to 2020 from 2010 with concomitant revisions in projected levels of activity and impact, and to republish the DEIS/DEIR.

Massport claims that there has been no change in schedule (i.e., item c on page 3 in letter dated 02/26/99) for the project since no preferred alternative was identified or selected. Further, it claims that no change in completion or work schedule dates for the Project has occurred. This is untrue. Massport choose to delay the submittal of the DEIS/DEIR documents; thus, there have been changes to the schedules discussed at the ARC meetings.

According to 40 CFR Part 1502 Environmental Impact Statements[1] (PP1050.1) "An agency shall commence preparation of an environmental impact statement as close as possible to the time the agency is developing or is presented with a proposal (PP1508.23) so that preparation can be completed in time for the final statement to be included in any recommendation or report on the proposal. The statement shall be prepared early enough so that it can serve practically as an important contribution to the decisionmaking process and will not be used to rationalize or justify decisions already made." PP 1508.23 describes a proposal as the following: " 'Proposal' exists at the stage in the development of an action when an agency subject to the Act has a goal, is actively preparing to make a decision on one or more alternative means of accomplishing that goal, and the effect can be meaningfully evaluated." The ENF Certificate was issued November 22, 1995. Massport and the FAA have not complied 85.89

[1] Council on Environmental Quality, 40 CFR Part 1502.5

with the required timing of the DEIS/DEIR document. Furthermore, the analysis uses baseline data of 1993 for a document submitted in 1999. 85.90

The FAA data on delays cited elsewhere in this report shows that the delay situation at Logan has improved since 1993 and is essentially in equilibrium, as assessed by the FAA. Massport has clearly demonstrated, by its action placing this project on hold for nearly two years, that the problem is not "a matter of priority." It now proposes to stretch out construction over a five-year period. Once planning, environmental review, and design were completed, one could build a new airport in five years! 85.91 85.92

B.2 Requirements of the ENF Certificate (issued November 22, 1995)

The ENF Certificate required consideration of several additional issues that were not specifically addressed in the DEIS/DEIR document, including:

1. Page 3 of ENF Certificate -	Discussion of diversion of cargo to off-airport alternatives	85.93
2. Page 3 of ENF Certificate -	Considering the off-airport alternatives as a separate scenario evaluated during the DEIS/DEIR	85.94
3. Page 4 of ENF Certificate -	Considering the development of a second major airport in discussion of environmental justice	85.95
4. Page 5 of ENF Certificate -	Detailing of the existing delay at Logan including delay derived directly from wind/weather and indirectly from delay at other airports	85.96
5. Page 6 of ENF Certificate -	Documentation of history of PRAS and problems implementing it	85.97

B.3 Cumulative Impacts

Massport argues that Federal policy limits the need to address cumulative impacts of the current proposals. This DEIR is submitted subject to Massachusetts laws, policies and regulations, in addition to federal regulations and guidance (page 7-3). As such, it is subject to the determination of the Secretary of Environmental Affairs as to whether cumulative impacts have been adequately addressed. 85.98

C. Growth & Long-Range Planning Issues

The Airside Improvement Planning Program is a short-range and limited response to a major concern about long-term trends, future growth, and increasing impact. Logan Airport is not going to go away. The prospect is for more and more passengers, more and more aircraft operations, and a greater impact on the surrounding communities. The DEIS/DEIR does not address the long term implication of growth. 85.99

C.1 Stimulation of Growth

Federal planning policy[2] establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan directly, because of delay reduction. The DEIS/DEIR makes a clearly contrary statement. In our opinion, the statement (page 7-3) that "The Airside Project has independent utility, and will not stimulate, preclude, or otherwise determine other development anticipated as part of Massport's landside planning effort" is incorrect.

Massport argues the Airside Improvement Project is independent of the landside projects in every way. We disagree. Both landside and airside projects clearly enhance the attractiveness of Logan Airport, the efficiency of managing ground and air traffic, and the capacity to handle such traffic and passengers. Of course, a more attractive Logan Airport will attract more discretionary travel, divert travel from other modes, and recapture travel from other airports. 85.100

The full implementation of the Airside Improvement Project, as proposed by Massport in its preferred alternative, would provide a runway configuration with an operational capacity equal or nearly equal to that provided by the current maximum capacity runway configuration at Logan Airport, the 4/22 runways in combination with Runway 9/27. This will significantly increase the average capacity of the airfield. It will significantly extend the time and meteorological conditions under which the highest operational capacities are available at Logan. This will temporarily reduce delay, as Massport has argued. Therefore, it should be expected that the near-term result would be to reduce the rate of "capture" of Logan passengers by other airports and by other transportation modes. This, in turn, will place greater burdens on all elements of all systems at or serving Logan. This is expansion of capacity. Such an increase must be translated into a projected increase in demand, as the FAA has stated in its regulations. 85.101

---

[2] FAA-APO-98-4 "Economic Analysis of Investment and Regulatory Decisions -- Revised Guide", Chapter 3, "Benefit Estimation", B "Capacity Increases which Reduce Congestion Related Delay"

C.2 Forecast Planning Period

This DEIS/DEIR, like the GEIR and Annual Updates, does not cover a sufficient planning period. Massport continues the fiction that 1999 is the near future and 2010 the far future (DEIS/DEIR page 7-5). For a $60 million project, and for Logan Airport, 2010 is the near future, beyond 2020 is the far future.

This section labels 1999 as "near term" and 2010 "long term." In terms of forecasting, Massport has provided an inadequate length of forecast years for evaluation of the long term impacts on the airside improvements proposed. Prudent planning would dictate that Massport look further than 10 years in the future in this document. Implementation of the proposed airside improvements is planned over a 5-year construction period beginning in 2000 (assuming permitting is completed). Thus, by the time all of the projects would be constructed (September 2004), the forecasts are only applicable for six years under the current timeperiods. The forecasts presented in the DEIS/DEIR are not appropriate for: a) determining the long term evaluation of the impacts planned, b) selection of base year data, c) timeframe for implementation of the project. 85.102

As a standard, FAA typically reviews and evaluates 20 year forecasts. Per FAA Advisory Circular 150/5070-6A entitled "Airport Master Plans," the following is noted: "The length of the short, intermediate and long-term activity forecasts should be decided, while 5-10-20 year times are typical, there may be justification for using different time frames." Massport has provided forecasts for current year (1999) and ten year (2010) periods. No justification for using these shorter time frames was given.

C.3 Base Year Assumptions

The base year for the development of these forecasts is 1993, five (5) years prior to the submittal of the DEIS/DEIR document. A more updated forecast for passengers at Logan in future 5, 10, and 20 years with high and low fleet scenarios should be provided for evaluation. 85.103

The Base Year and 29M High-Range Fleet data used for development was based on conditions through 1993, a full five years prior to the submittal of the DEIS/DEIR document. Massport cites significant changes since 1993 in the aircraft fleet mix; thus the validity of the base year and high-range fleet forecasts are not appropriate for consideration in this analysis because of: a) age of background material and b) changes in fleet mix occurring during short term period (1993-1998). In fact, Massport prepared alternate fleet forecast called the 29M Low-Range Fleet data. 85.104

C.4 Forecasts

Forecasting the total number of annual passengers is the first step in the methodology for the 29M High and Low Fleet Assumptions (Appendix E, Section 3, page 3) and the Logan 2010 Fleet Forecast (Appendix E, page 17). Since specific information was not presented for the development of the passenger forecasts that is the input for the fleet forecast, the fleet forecast output is invalid.

Additionally, although the methodologies for the 29M, 37.5M and 45M were explained in Appendix E, the forecasting methodologies are not consistent with each other. The Base Year and 29M High Forecast were developed under one method, the 29M Low Forecast made specific adjustments based on changes in the fleet activity at Logan and the 37.5M and 45M scenarios were developed using a different methodology (and were performed in 1995).

Since the airside improvements are to cost over $60 million to construct and since there is significant concern from the communities regarding the long term demand and development at Logan, Massport should provide recent and relevant passenger forecasts for a 20 year period with associated operational forecasts using high and low fleet scenario assumptions that are consistent for all forecast years. This information is the backbone of the environmental impact report and affects all of the analysis of the alternatives. 85.105

It is important to note that the DEIS/DEIR document footnotes that Massport's planning forecasts will be formally reviewed in the next GEIR. This footnote says that the forecasts, which the evaluation of these airside improvements was based on, is going to be changed in 1999. Massport delayed submittal of the DEIS/DEIR document for over two years; now, it is submitting forecast information that they indicate will be updated this year.

The DEIS/DEIR does not indicate the detailed methodology used to develop the levels of passenger forecasts presented. Per 40 CFR Part 1502 Environmental Impact Statements regarding methodology and scientific accuracy ". . . They shall identify any methodologies used and shall make explicit reference by footnote to the scientific and other sources relied upon for the conclusions in the statement."[3]

Massport is now saying that the potential diversion to regional airports is "accounted for in the range of passenger levels analyzed."" These passenger levels, ranging from 37.5 to 45 million annual passengers and originally projected for the year 2010, were derived from standard demographic projections based on a number of factors not including the potential diversion to regional airports. (See, i.e.., the 1994/5 GEIR) 85.106

[3] Council on Environmental Quality, 40 CFR Part 1502.24

It should follow that as passenger levels rise and congestion increases, the attractiveness of regional airports, and therefore the extent of diversion of passenger traffic, should increase. Thus, the diversion amount on an annual basis should be higher at a 45 million annual passenger load than at 37.5 million.

Massport also suggests that the past parallel between passenger growth and increase in flight operations will change. In the past, the growth curve of flight operations has essentially mirrored the growth curve in passengers, on an annual basis. Massport now projects that in the future, average aircraft capacity will increase, and average load factors will also increase, thereby reducing the rate of growth of operations compared to the rate of growth of passengers. Recent experience, through 1998, does not bear out this projection. The 1998 data indicates the distribution of jet passenger operations by aircraft size category has changed little since 1993.

Massport must clearly identify the basis for the passenger demand projections, and must state the confidence level in those projections. Similarly, it must state the confidence level in the projections of diversion at each projected passenger level, and show the resultant range of passenger level projections.

Massport argues that the growth in passenger traffic experienced at the Manchester, New Hampshire Airport and the T. F. Green Airport in Warwick, Rhode Island represents shifts of demand from Logan Airport. It is equally likely that the introduction to those two airports of low-cost carriers has stimulated overall regional air travel growth, the bulk of which has been absorbed at those two airports.

The distinction between the "low operations fleet" and the "high operations fleet" is confused in the DEIS/DEIR. Table 4.2-6, 1999 Aircraft Operations Forecasts, is consistent with the text description under Section 4.2.2. In this table, under the "high fleet" forecast, the distribution of passengers shifts slightly to the regional carrier fleet. The passenger jet operations decrease slightly, the regional carrier operations and total operations increase significantly. However, in the 2010 Aircraft Operations Forecasts (Table 4.2-7) the passenger jet operations increased markedly over the 1999 forecasts, with the increase ranging from a low of 11% comparing the "low fleet" forecasts, to 23% to 35% for the "high fleet" forecasts. But the regional carrier operations remain within the general range projected for 1999, 200,000 to 250,000 operations per year. In the "2010" "high fleet" forecasts, the regional carrier operations are shown as 42% of the carrier fleet operations, rather than the 50% stated as an assumption in Section 3.1.2, page 1-11. 85.107

This and the percentage distribution of passengers between "passenger jets" and "regional carriers" presented in those tables indicate that most of the projected increases in passenger demand will be met by increased operations of the "passenger jet" fleet. This is the fleet that creates the noise impacts at Logan and elsewhere. 85.108

Table 1 as follows shows historic activity levels at Logan. Table 2 (based on Table 11 in Appendix E of the DEIS/DEIR) presents Massport's projected changes is the jet passenger fleet mixes for the forecast years.

It should also be noted that cargo fleet operations in 1999 (Table 4.2-6) were held constant in both the "low fleet" and the "high fleet" projections, at 13,000 operations. For 2010 (Table 4.2-7) the cargo fleet (jet) "low fleet" forecast operations are not increased from the 1999 forecasts, and are increased to 18,000 operations per year for the high fleet forecasts. If the projections were consistent, the 2010 low fleet forecast would use 18,000 cargo operations and a total of 325,000 jet operations per year. Furthermore, the increased economic growth projection that results in the 45 million passenger forecast in 2010 should also include a concomitant increase in the cargo jet operations forecast to 22,000 operations per year and a total jet operations of 382,000 per year. These corrections will affect the noise and noise impact forecasts of Chapter 5 and Appendix L. 85.109

In our opinion, Massport should be carrying its projections a minimum of 20 years from a base year of 1998, for a draft environmental impact statement and report published in 1999. We strongly recommend the year 2020 as the planning period for this project, consistent with Federal planning recommendations. 85.110

TABLE 1

Massport Logan Activity Levels, 1990-1998

YEAR	PASSENGERS	OPERATIONS						
		TOTAL	JET	% JET	NON-JET	%NON-JET	GA	%GA
1990	22.9 million	425,000	249,000	59%	$ 151,000	36%	$ 25,000	6%
1991	21.5 million	430,000	233,000	54%	$ 174,000	40%	$ 24,000	6%
1992	22.7 million	474,000	244,000	51%	$ 205,000	43%	$ 26,000	5%
1993	23.6 million	493,000	246,000	50%	$ 244,000	49%	$ 23,000	5%
1994	24.5 million	459,000	251,000	55%	$ 183,000	40%	$ 24,000	5%
1995	24.2 million	466,000	241,000	52%	$ 201,000	43%	$ 24,000	5%
1996	25.1 million	456,000	241,000	53%	$ 189,000	41%	$ 26,000	6%
1997	25.6 million	483,000	255,000	53%	$ 198,000	41%	$ 30,000	6%
1998 *(partial)*	22.5 million	*425,000*	*233,000*	*55%*	$ *166,000*	*39%*	$ *26,000*	*6%*

Note: This table demonstrates the constancy of the relationship between jet carrier aircraft operation and regional non-jet operations at Logan over the period 1991-1997. Absent significant changes in markets or types of travel demand, the basis for Massport's assumption of changes in this relationship is not apparent.

TABLE 2

PASSENGER JET OPERATIONS AT LOGAN AIRPORT

YEAR/Pax Level	1998		1998	1997	29 Million		29 Million		37.5 Million		37.5 Million		45 Million

176-225	92,690	26%
>225	61,235	17%
TOTAL	359,762	100%

Comments: It is counterintuitive that the total passenger jet operations should be the same for the 37.5 million annual passenger and 45 million passenger High Fleets.
For the same two passenger levels, 37.5 and 45 million, the Low Fleet Mix for the respective years increases by about 32,000 operations (+10.7%).
Comparing the 1993 "high fleet" mix operations to the 29 million passenger High Fleet operations yields a similar 10.3% increase in operations

Comment: The projected distribution of operations among jet aircraft size categories is compared separately for the "low fleet mix" and "high fleet mix" for each of the three projected annual passenger volumes. For the "low fleet" forecast, Massport assumed a significant shift, both in numbers of operations and in percentage of total operations, to larger aircraft as passenger volumes increase, except that both operations and percentage of the smallest jets are also forecast to increase. For the "high fleet" forecasts, Massport's projected trends are less clear. (There appears to be a significant error in the forecast number of operations of the smallest passenger jets in the 29 million passenger "high fleet" forecast.) Even accounting for that error, operations in that category are projected to increase as passenger volume increases. For the 37.5 million annual passenger "high fleet" forecast, operations of all aircraft size categories are projected to grow in number, although percentage of operations decreases in all but the smallest and largest size categories. (The growth in number of operations in the size category 176-225 passenger capacity is essentially nil.) However, the projection for the 45 million annual passenger "high fleet" scenario is quite different. Numerical growth in operations is forecast for the smallest and the two largest size categories, which also increase percentage share of operations significantly. The number of operations in the two remaining size categories, 91-120 and 121-175 passenger capacity aircraft, decreases dramatically both numerically and as a percentage of total operations.

C.5 Regional Context of Logan Airport and the Regional Transportation Policy

Logan Airport is recognized as a major facility, and its operations a major activity of the regional transportation complex. An issue that we believe is precipitated by the Airside Improvement Planning Process is the future role of Logan Airport in regional transportation. The affected communities universally believe that the impacts of air and ground traffic associated with Logan Airport have for many years created intolerable and unacceptable noise and traffic impacts, and make significant contributions to unacceptable air quality levels. Massport argues that airlines serving Logan and airline passengers currently encounter excessive and unacceptable levels of delay. So, what is to be done?

Massport projects air traffic operations to increase substantially over the project planning period. A conservative projection is a 20% increase in total operations over the next decade. A more important assessment is the projected increase in "equivalent jet operations," which takes into account the substantial increase in noise impact of a nighttime operation compared to a daytime operation. The projected growth in "equivalent jet operations" approaches 50% over the next decade. 85.111

Massport proposes to increase the percentage of passengers accessing Logan Airport who do so in high-occupancy vehicles, but its proposal falls far short of absorbing the full projected increase in passenger ground access requirements, even over the limited planning period. 85.112

C.6 New Large Aircraft

A new class of much larger aircraft is under active development by several manufacturers. These aircraft are referred to as "New Large Aircraft" (NLAs)[4], and are projected to have passenger capacities ranging upwards to nearly 1,000 (!), to weigh in excess of one million pounds (Maximum Take Off Weight), to utilize engines with total aircraft thrust ranging upward to around 350,000 pounds of thrust, to have wingspans of as much as 260 feet and to be as long as 300 feet, and to have main wheel assemblies as wide as 50 feet. Representatives of this class include the Airbus A3XX, and the Boeing 747-500 and –600.

The FAA will categorize them as a completely new "group" of aircraft, Group VI. (The B 747-400 is in Group V.) Another type of aircraft, the High-Speed Civil Transport (HCST) would also be included in this Group VI. These are supersonic aircraft, with a significantly longer development horizon. The range of these planes is expected to exceed 7500-8000 miles, and their projected utilization is for 85.113

[4] FAA Report DOT/FAA/AR-97/26, "Impact of New Large Aircraft on Airport Design," March 1998. This report is available on the Internet at www.tc.faa.gov/its/worldpac/techrpt/ar97-26.pdf.)

international heavily traveled routes. The manufacturers are currently projecting introduction of these planes into the international fleets in the period 2003-2006.

Current information indicates a host of serious issues associated with the introduction of this class of aircraft. Their size, weight, turning radii during taxiing, wingspans and wingtip clearance requirements will require substantial adjustments of many kinds to airfields. Their size and height, and the number of passengers, pose significant terminal problems. They are expected to require runways of about 11,000 feet in length. Many existing airfields will not find it feasible to accommodate these aircraft, or will require extensive waivers of FAA requirements and significant operating restrictions even for very limited numbers of NLA operations. Others will require very large investments, substantially over $100 million in the case of Kennedy Airport, to accommodate these planes.

With their enormous size and great thrust, wake turbulence will be a problem, and jet blast and intake problems would have to be dealt with. Basically, these planes will need a lot of space both in the air and on the ground. These considerations will in turn create delay problems.

We doubt that Logan can accomplish the modifications necessary to accommodate these planes. This therefore becomes another argument for the development of a major international airport serving New England that will have the capacity and capability to handle this generation of planes.

C.7 Community Impacts

These documents fail to address how Massport, the air transportation system, and the regional transportation and communication systems will cope with continued passenger and operations growth while simultaneously maintaining and improving environmental quality and quality of life, and an efficient transportation and communication system in the future. The proposed projects provide only limited and interim relief to whatever aircraft operating delays at Logan Airport are caused by or as a result of the airfield configuration. The delay problem as modeled and represented by Massport will get worse. 85.114

How much worse, and how soon, will be determined by decisions of passengers and airlines. What will Massport do then? Work with the FAA to find ways of cramming more operations into daytime hours? That would certainly increase community impacts. Propose some further reconfiguration or expansion of the airfield? That is not possible without enormous environmental and community impacts, and huge costs. Work with the air transportation industry and the operators of other airports to create viable, attractive, competitive, full-service alternatives to using Logan? Massport suggests this option has a limited capability to relieve congestion at Logan,

and further suggests that Logan will always be the more attractive option. This attitude, and those facts, if they are facts, must be changed. Or, does the resolution lie in the establishment of a new, major regional airport?

Massport argues that the project "will not result in the division or disruption of established communities." This must refer solely to physical division or disruption, since Massport's promotional and political strategy has clearly been to effect division among the communities around Logan Airport. Some of these communities will be further disrupted by the short-term shifts in runway usage which are the basis for Massport's claims of "net benefits", all will be disrupted by further growth in Logan air operations over the near and far futures. Furthermore, this is the last possible physical project to increase Logan airfield capacity that could be undertaken without "division or disruption of established communities," or of the waters of and lands under Boston Harbor. 85.115

Aircraft operations and the impact of those operations at Logan and to Logan neighbors will continue to increase as long as Massport and the FAA, or other state and federal agencies, do not exercise control over airline practices and policies. It will have taken over 20 years to fully convert the jet fleet to Stage 3 aircraft, and there is no program envisioned to create a future class of substantially quieter transport aircraft. The noise impact per operation is unlikely to diminish significantly in the next 30 to 40 years. 85.116

Both economic growth and the highly competitive nature of the air travel business increase passenger demand for both business and pleasure travel. As long as this demand is not channeled to other means of transportation and communication, and to other airports, passenger demand at Logan will grow. This growth will in turn spur growth in aircraft operations.

It seems inevitable that Logan Airport will experience growing congestion, and with that congestion, will come increasing pressure for additional measures to reduce it. 85.117

The Secretary of Environmental Affairs should determine that significant planning deficiencies exist in the DEIS/DEIR that must be addressed. The DEIS/DEIR should be found inadequate, and a new Draft document should be required. 85.118

D. Environmental Issues

The boundaries of the Airfield Study Area, Figure 5.1-2, should be extended to include the Hyatt Hotel and the waters to the east of Governors Island, in order to include the runway safety areas and other protective envelopes. 85.119

D.1. Noise

Noise in the surrounding communities is the most serious negative impact of Logan Airport. The FAA and Massport have chosen to represent noise impacts through use of the Integrated Noise Model (INM). This model produces "contours" (lines of equal intensity) of "yearly day-night average sound level" (YDNL) in 5 decibel (dB) increments. FAA sets 65 dB(A) as the YDNL below which all land uses (including residential and "sensitive receptors") are compatible. Note especially that this metric is a yearly average number.

The weakness of this methodology is demonstrated by the examples of the Milton/Quincy/Braintree area and the Town of Hull. Neither at present nor under any future scenarios does the 60 YDNL contour (much less the 65 YDNL) include any portion of these communities. Yet residents of those areas are distressed by aircraft noise, as demonstrated by the aggressive participation of their representatives on the Community Advisory Committee (CAC). This concern, this impact, results from peak noise intensities (as partially expressed by the "times above noise level" metric), the frequency at which they are experienced, and the times of day during which overflights occur. 85.120

The most salient observation is that "equivalent operations" will increase substantially over almost all areas over time. The causes are increases in total jet operations and in nighttime jet operations ("Equivalent operations" is the sum of (nighttime operations x 10) plus daytime operations.) We have compared the base year, 1993, to Massport's projections for the 37.5M Low Fleet scenario. Both alternatives 1A (all options except peak period pricing) and Alternative 2 and 3 (no runway) were compared.

The Tables 3, 4 and 5 as follows, derived from the DEIS/DEIR Tables 6.2-3 and 6.2-4, display these comparisons. (It would have been preferable to compare against 1998, but adequate data is not available in the DEIS/DEIR.) Attention should be paid to those operations that impact significant populations (based on assumed flight tracks and the INM); departures on Runways 4, 9, 27 and 33, arrivals on Runways 4, 15, 22, and 27; and to the multipliers comparing "future fleet" equivalent operations to the base year. 85.121

Table 3
Equivalent Operations
Departures

Runway		1993	37.5M Low Fleet			
		"Base Year"	Alt 1A	% change	Alt 2/3	% change

Runway	Alt 1A	Alt 2/3	Runway	Alt 1A	Alt 2/3
4	nil	nil	4	40%	60%
9	70%	100%	15	140%	(-30%)
27	119%	nil	22	70%	90%
33	30%	20%	27	10%	40%

The conclusion drawn from Table 5 is that while the different alternatives slightly shift overflight impacts among communities, most residential areas will experience significant increases in impacts over time.

The plan to add another runway on the southern boundary of the airport will definitely alter the noise patterns for those south and southwest of the proposed runway. Although the noise level for Alternatives 1 and 2 appear to be similar, there are appreciable differences. The South Boston and Jefferies Point areas will definitely have an increase in noise above 60 dB and possible above 65 dB. Although the planned runway is to have all departures to the southeast, certain atmospheric conditions will affect the intensity of the additional noise in these areas. There is forecast to be an increase of five or more dB in approximately a three square mile area on the south shore of the Inner Harbor. 85.122

Only four monitor locations were used on the south shore of the Inner Harbor for the airside analysis of sound level contours (Vol 1, Figure 5.2-1), while the remainder were northeast, north and east of and in close proximity to the airport.

Two sensor sites to the west-northwest of the airport are those at the Jefferies Point Yacht Club and at Summer near Lawsom in East Boston. These two sites would receive ground noise from the jet engines as they taxi to Runway 14 and as takeoff power was applied. This noise is quite directional when the aircraft reaches full power. According to the day-night contours in the analysis, the noise level would never reach 60 YDNL. The Times Above Noise Levels (TANL) tables contradict 85.123

these figures. The TANL analysis in the DEIS/DEIR Appendix L shows that there would be increases to the 65 YDNL threshold under all scenarios, including Alternatives 2,3, and 4. This is another illustration of the weakness of the YDNL contours in defining noise impact.

D.1.a Enhanced Preferential Runway Advisory System - PRAS Implementation

Noise abatement procedures, it is understood, are a significant concern of the Logan Airport Air Traffic Control Tower. However, the PRAS goals are advisory and may be declined by the Air Traffic Supervisor on duty after analysis of the recommended PRAS runways and weather conditions.

To change a runway configuration and move traffic to another combination of runways is similar to diverting a flow of water from one outlet to another with a similar receptacle without shutting off or spilling any of the water. Changing traffic flow to attain PRAS noise goals takes pre-planning by the supervisors and controllers. In many instances, a runway or traffic flow change can also require changes of traffic flow not only at the Boston Air Route Traffic Control Center but also at adjacent facilities. These concerns suggest that attainment of the PRAS goals will remain elusive. 85.124

Past experience with the PRAS system has demonstrated the difficulty of attainment of the PRAS goals. It is clear that capacity considerations and controller workload have taken precedence. We expect this situation to continue, and to be exacerbated by growth in operations over time.

We believe airfield operations are unlikely to attain, and even less likely to sustain, the progress toward attainment of PRAS goals that Massport projects. Therefore, the projected noise reduction "benefits" of the proposed project for the communities impacted by operations using the 4/22 Runways are not likely to be attained or if attained to be sustained. (Conversely, the projected noise increase "dis-benefits" of the proposed project for the communities impacted by operations using the 15/33 (and 14/32) Runway and by departures on Runway 27 are also less likely to occur.)

D.1.b Night-time Operations

The number of jet operations at night (Appendix H) is projected to increase significantly over time. The increase is from about 31,000 operations per year and 12% of all jet operations in 1993, to about 40,000 and about 14% of jet operations in the 29 million passengers scenario in 1999. A further increase to about 52,000 operations per year and about 16% of jet operations is projected in the 37.5 million/low fleet scenario, and to about 65,000 operations and 18% of

jet operations in the 37.5 million passenger/high fleet scenario. In the 45 million passenger/high fleet scenario the projected increase is to about 89,000 annual operations, representing 23% of all jet operations. **This shows projected major increases in nighttime jet operations from the 1993 level.**

The trend is clear. The number of nighttime jet operations can be expected to double within the foreseeable future under conservative forecasts. The noise impacts of this increase are huge. All nighttime operations of jets weighing over 75,000# are required to be of Stage 3 aircraft, at this time. Therefore, the growth in numbers and percentage of nighttime jet operations will not be mitigated by the conversion to Stage 3 aircraft. 85.125

Table 6
Growth in Jet Operations

SCENARIO	Total Jet Operations	Daytime Jet Operations		Nighttime Jet Operations		Equivalent Jet Operations	
		Number	Percent	Number	Percent	Number	Increase
1993	262,200	231,000	88%	31,200	12%	543,400	------
29M Low Fleet	297,900	257,500	86%	40,400	14%	661,200	22%
High Fleet	294,100	253,500	86%	40,600	14%	659,300	21%
37.5 M Low Fleet	331,400	279,800	84%	51,600	16%	796,200	47%
High Fleet	363,000	297,700	82%	65,300	18%	951,000	75%
45 M High Fleet	392,800	303,900	77%	88,904	22%	1,190,000	120%

This table is constructed from data and projections presented in the Logan DEIS/DEIR, Appendix H.

The last columns of the table above, also taken from Appendix H, apply the "nighttime noise equivalent" factor of 10 to the (forecast) nighttime jet operations to predict the "noise equivalent" number of jet operations during the year. **This of course is not a forecast of actual operations.** It is rather a statement that the predicted mix of operations in a particular scenario (year, passenger traffic, fleet, and resulting non-jet, jet, day, and night operations) would result in a noise impact equivalent to the impact of that number of operations if they all occurred in the daytime.

This is an important set of numbers, speaking eloquently to a critical element of the increasing impact of Logan on the communities in the coming decade. It should be a major factor in the debate about the long-term management of travel and communication for the Metropolitan area, and stresses the need to reduce dependence on and preference for air travel and Logan in particular. An alternative that should be considered is the creation of a cap on nighttime operations pursuant to FAR Part 161. 85.126

D.1.c Noise Monitoring by Massport - Late Night Preferential Runway Use

There has been a program at Logan for preferential use of over water approaches and departures, in effect from midnight to 6:00 a.m. The objective is to maximize the use of runway 15R for departures and runway 33L for landings during that period. The effectiveness of this program for the years 1995, 1996, and 1997 is reported on in the GEIRs. The program would appear to have some benefit, as reported, but is not discussed in the DEIS/DEIR. The data presented in the GEIRs suggest a higher potential benefit in the initial year of operation than in the last reported year, comparing the percentage of time that those two runways were designated as the active runways during that midnight to 6:00 a.m. period. The DEIS/DEIR should report on the current status of the program, and discuss/explain the apparent diminution in its application. **The construction of Runway 14/32 would not enhance the opportunity to utilize this program nor increase its benefit.** 85.127

D.1.d Flight Tracks

The 1997 GEIR Update contains an analysis of flight tracks on departures from various runways. The principal observations from this report are that a significant number of flights re-crossed the shoreline over Hull and were also below 6,000 feet. This is true for departures from 15R (although the numbers are relatively small) and from 22R/22L, where only 42% of the crossings through Hull No. 2 gate were above 6,000 feet. This may explain the level of concern of aircraft noise in Hull.

Comparison of the report of the flight track monitoring program in the 1994/1995 GEIR Update with that reported in the 1997 GEIR Annual Update shows the following. While the number of aircraft departing Runways 22 that subsequently cross the Hull peninsula on their westbound leg did not increase appreciably, the percentage of aircraft crossing that peninsula below 6,000 feet increased from about 8% to about 42%! (The noise abatement procedure for runway 22 departures is to pass north of the Hull peninsula on the eastbound departure and to pass across the shoreline south of the Hull peninsula at an altitude of over 6,000 feet on the westbound return leg.) It appears from the data that a significant percentage of operations failed to conform to the procedure in two ways--the Hull peninsula was crossed, and it was crossed at less than 6000 feet altitude. 85.128

The 1997 GEIR Study does not report on compliance with the flight tracks for Runway 27 departures as established by the FAA in 1996. The CAC representatives from the Runway 27 coalition are vociferous in their complaints about failure to comply with the agreed-on departure procedures, which were developed as part of the Runway 27 DEIS/DEIR. Massport reports that in 1997 85.129

the FAA initiated an action plan to improve compliance with the Runway 27 flight corridor.

D.1.e Benefits of Further Conversion to Stage 3 aircraft from Stage 2 aircraft

The Logan Low-Frequency Noise Study reported in 1996 by Harris, Miller, Miller & Hanson, Inc. indicates that Massport overstates the benefit of further conversion to Stage 3 aircraft on future noise levels around Logan Airport. First, there is only minimal conversion left to be accomplished, as Massport reports that the percentage of aircraft using Logan that meet the FAA criteria for Stage 3 is about 85% at present. Second, the HMMH Report indicates little or no "Stage 3" benefit (a) under the flight track of arriving aircraft, (b) during thrust reversal, and (c) to the sideline of arriving aircraft; and only limited benefit to the sideline of departing aircraft. The principal benefits, according to the HMMH Report, will be experienced under the flight track of departing aircraft and to the rear of departing aircraft at the start of roll. 85.130

The impact of flight operations on persons living under or near flight tracks has been assessed and evaluated using a number of approaches and metrics, as reported in the DEIS/DEIR. These include the YDNL contours, dwell, persistence, and "time above" a selected noise level. The interference and annoyance associated with flight operations is, of course, felt in a given area only when the particular flight path is in use. During those periods, the important factors are the loudness of the event (including a nighttime correction), the frequency at which the event occurs (or the interval between events), the duration of the period during which the event occurs, and whether the event occurs during a noise-sensitive period, *i.e.*, nighttime. Enhancement of the ability to evaluate and to report this form of impact might allow those concerned to better understand community perceptions of aircraft noise and the lack of broad community acceptance of the use of YDNL contours as an adequate means of expression of aircraft noise impacts. 85.131

D.1.f "Soundproofing"

Application of measures to reduce sound transmission through building envelopes to interior spaces, called "soundproofing" but more accurately termed "acoustic treatment" can certainly be beneficial in providing a degree of respite from aircraft noise. When accompanied by whole-house air-conditioning (to allow the window barriers to remain in place year-round) it can provide year-round benefits indoors. There are several drawbacks. First, it is impossible by this technique to improve ambient conditions outdoors. Second, it reduces communication and contact of those within the structures with the outside environment, in effect "cocooning" residents within their houses. Third, as a principal objective and effect of the

"soundproofing" program is to reduce or eliminate noise pathways through the structure, this also reduces air exchange between the structure and the ambient air, trapping within the structure air contaminants that are generated therein. Thus, a byproduct of "soundproofing" is an increase in the potential for interior air contamination in the absence of mechanical ventilation.

This is not an argument that "soundproofing" is a bad idea or should not be continued and intensified as a mitigation measure for otherwise unavoidable aircraft noise impacts. It is, however, a statement that acoustic treatment should not be regarded as a full substitute for reduction in ambient levels of aircraft noise. 85.132

Concerns about Massport's residential "soundproofing" program include the pace of the program, as Massport has had a target of completing the program in 15 years, or the year 2000. Massport depends on FAA grants for the funding of this program and is therefore limited by FAA eligibility rules as to the location with respect to noise contours of units for which "soundproofing" may be provided. FAA Order 5100.38A makes ineligible for AIP funding any non-related code-required building improvements necessary to accommodate acoustic treatment improvements. This may impose significant burdens on some property owners. 85.133

Another concern is the failure to provide air-conditioning in conjunction with the "soundproofing" program. Note that according to the DEIS/DEIR, the FAA grants provide for 80% of the cost of the program, with Massport providing 20%. 85.134

A further concern is the eligibility of dwelling units for the program. At present, eligibility is determined by the location of the unit within the 65 YDNL noise contour, as determined by the application of the Integrated Noise Model (INM). Massport should consider whether other factors should be included in the determination of eligibility that might not be adequately captured by the use of the 65 YDNL noise contours. Consideration should also be given to establishment of an interior noise level goal for the program regardless of location of the dwelling unit. Any restructuring of the program should be undertaken with full communication with the interested and affected communities. 85.135

The shortcomings of the INM should be recognized and accommodated in the further development of the acoustic treatment program and with respect to eligibility for the program. The disparity between YDNL levels projected using the INM and dB levels measured in the field is well demonstrated around Logan Airport. Credence should be given to the measured values in determining eligibility and design of corrective measures. 85.136

D.1.g School Sound Insulation Program

Massport reports that all schools eligible for the "soundproofing" program have been treated. That is certainly positive. However, the statement does not address the question of whether the treatments have been adequate or sufficient in every school to which they have been applied, or the question of whether all schools that would benefit from some form of acoustic treatment have received that benefit. 85.137

D.2 Air Quality/Odors

The issues with respect to air quality impacts of the Logan Airside Improvement Planning Project are (1) shifting of existing emissions to other locations on and around the airport, and (2), overall growth in aircraft and motor vehicle emissions operations and emissions.

Shifting or relocation of aircraft engine emissions and impacts will follow and relate to changes in runway and taxiway utilization that are projected to occur under any of the "build" alternatives. Generally, these changes in impact locations will mirror the shifts in noise impact. The change in air quality impact most likely to be detected is that of odors.

D.2.a Odor Assessment

(Please refer to the Appendix B - "Analysis of Odor Complaints at Logan Airport" memorandum of March 27, 1996 to the Community Advisory Committee).

Changes in odor impacts are most likely to occur in the Jefferies Point neighborhood from takeoffs on Runway 14 (taxiing aircraft approaching the runway and holding, and start-of-roll thrust and resulting emissions). The wind direction during use of Runway 14 for takeoff will, of course, disperse odorous contaminants in the general direction of Jefferies Point. This would constitute a new source of odors in the Jefferies Point area and would also affect the Hyatt Hotel. 85.138

Increased use of Runway 15 for takeoffs can be expected to have an influence on odor impacts downwind of Runway 15 in the Bremen Street/Eagle Hill area of East Boston, due to increased emissions from taxiing, holding and start of takeoff roll. In this case, as contrasted to Runway 14, this would not be a new source of odors, but rather, an increase in the frequency during which the source was active. An odor receptor location in East Boston representing the most proximate residential receptor located along or near the extended centerline of Runway 85.139

15R/33L should have been selected for odor modeling rather than Location 10 at the intersection of Condor and Glendon Streets.

The construction and use at the Centerfield Taxiway would change odor impacts in the Bayswater Street area of East Boston. Increased stacking of taxiing aircraft in the northern portion of the airport would increase odor source strength, a minor shift of taxiing operations from Taxiway November to the Centerfield Taxiway would slightly increase the dispersion and dilution of odors prior to reaching the Bayswater Street area (compared to emissions from aircraft on Taxiway November). The use of the Centerfield Taxiway would place taxiing aircraft closer to the Court Road section of Winthrop, where the odor impact would depend on the crosswind component during operations on Runways 4 and 22. 85.140

Responses to changes in odor strength are logarithmic in nature, as pointed out in the K. M. Chng Environmental Report of 1996 and in the attached memo of David Standley of March 27, 1996. Therefore, it is entirely possible that changes in odor emission intensity/source strength as they may affect Bayswater Street and Winthrop will not be sufficient to be noted by residents. However, the introduction of a new source, as in the case of Runway 14, is very likely to be detected, noted, and complained of. The same is probably true of an increase in frequency at which detectable odors are present, as could be the case for increased use of Runway 15 for takeoffs. 85.141

Improvements in efficiency of ground taxi operations, while potentially yielding or resulting in reduction in odorous emissions generally on the airfield, are not likely to be detected in the neighborhoods as reductions in odor intensity. 85.142

D.2.b Dispersion Modeling Results

These results show that growth of operations at Logan Airport will increase contaminant concentrations over time at most modeled locations, although the modeled concentration of selected air contaminants are within applicable ambient air quality standards or guidelines. The modeled increase in one-hour predicted levels of Volatile Organic Compounds ("VOCs") is of particular concern. This class of compounds is used as a surrogate for odorous compounds. The projected increase in concentrations from the 1999, 29 million-passenger scenario to the 2010, 37.5 and 45 million passenger scenarios is more than sufficient to elicit negative responses from exposed populations. It appears from the modeling results that the principal determinant of overall changes in VOC emissions would be the Taxiway Improvement Program. Runway 14-32 would have little impact on total emissions from aircraft sources, although as noted above its use would introduce a new odor source to Jefferies Point. 85.143

Over this same time frame, nitrogen oxide emissions from aircraft sources at Logan Airport are predicted to increase by about a third irrespective of the alternative selected. Particulate matter ("PM10") emissions also increase by as much as a third from the 29 million to the 45 million-passenger scenarios, irrespective of alternative selected. These increases in emissions appear to be due in large measure to increased operations, in part to changes in engine design.

Combining Tables E-13 and E-14 shows that for all modeled contaminants other than VOCs, the difference (if any) among Airside Improvement Project alternatives is much less significant than the projected growth of emissions over time. The direct or indirect comparison of various alternatives to the baseline year 1993 is misleading. Conditions have changed substantially since 1993 in many respects, and emission estimates for the various alternatives and for the various scenarios should be compared to 1998, the most current year for which operational data are available. 85.144

VOC emission estimates from aircraft sources are anomalous in that the data presented indicate essentially no increase in emissions over time despite growth in operations and regardless of alternative modeled. It is unclear why aircraft VOC emissions are not projected to increase with increasing numbers of aircraft operations. Massport models "odor indicator" emissions as VOCs from low-power aircraft operations in Tables ES-13 and ES-14. The K. M. Chng Environmental Study of 1996 reports that high-power operations (runup and takeoff roll) may be significant sources of emissions of odorous compounds despite lower concentrations during that mode of operation, because of the high volume of contaminants discharged, yet this mode was not incorporated in the "odor emission" estimates. 85.145

The dispersion modeling protocol used for the DEIS/DEIR utilized the 1993 year-of-record of meteorological data as input to the dispersion model. Massport used a ten-year hourly average of meteorological conditions at Logan as input to the DELAYSIM Model for calculating delay times associated with various alternatives and runway configurations. Massport should have used the same ten-year hourly average meteorological input for the air quality dispersion model, and should be required to rerun the dispersion model for all of the conditions modeled for the DEIS/DEIR (Section 3.1.2 Dispersion Modeling, page 6-67). Further, for odor modeling alone, it should be recognized that any problem of odor detection and nuisance is associated with conditions that will provide the maximum exposure concentration and maximum response characteristics, as set forth in the K. M. Chng Environmental Report. 85.146

The use of the EPA Industrial Source Complex Dispersion Model utilizes too long an averaging time to adequately model peak odor concentrations, which is the 85.147

stimulus of concern for odor response. Furthermore, averaging over a one-hour period essentially washes out the peak concentration profile. The modeling that was performed should be supplemented by the application of a "puff" model utilizing reasonable worst-case dispersion and dilution conditions and short-term peak emission rates, in addition to the factors set forth in the Chng Report. For all of the above reasons, the odor modeling and odor impact assessment procedure is inadequate. 85.148

No references are given for the assertion that newer engines associated with Stage 3 aircraft produce lower hydrocarbon emissions. The DEIS/DEIR demonstrates that complete conversion to Stage 3 aircraft in the fleet at Logan must (a) be accomplished by the year 2000, (b) will affect less than 15% of the current fleet, and (c) will occur independently of the Airside Improvements Project. Thus, the assertion that odorous emissions will decrease over time has not been substantiated. 85.149

D.3 Endangered Species - Upland Sandpiper

A program is required for off-site mitigation to compensate for impacts to the nesting habitat of the state-listed endangered upland sandpiper on Logan Airport. The suggested program appears highly speculative, and seems irrational with regard to protection and enhancement of so much of the species as tends to reside in and utilize habitat in the Boston Metropolitan Area. Camp Edwards on Cape Cod is over 50 airline miles from Logan Airport, in a completely different ecosystem. Massport should be required in the DEIS/DEIR to define a project fully acceptable to the Massachusetts Natural Heritage and Endangered Species Program that involves creation of a comparable habitat and its protection and preservation in the Metropolitan Area. Massport has been aware of this issue for several years, has had ample time to resolve the matter with NHESP, and should be required to set forth the resolution in the DEIS/DEIR. 85.150

D.4 Water Quality

The presentation for minimizing water quality impacts during construction is completely inadequate and is substantively limited to the one paragraph on page 6-94. There is no discussion of erosion and siltation control measures, best management practices during construction, of grain size distributions and loading that might be expected from runoff during construction or of proposed acceptable discharge rates to avoid siltation of adjacent wetlands. There is also one sentence each on pages 6-96 and 6-97, which refer to plans not yet developed or permits not yet issued. Reference is made to Massport standard programs for construction at Logan, but these are not attached to the DEIS/DEIR nor cited by title and location for reference. 85.151

D.5 Soils Management

Massport has performed no soil sampling and analysis in the principal areas of proposed excavation for the planned construction projects. Of particular interest would be the cargo and general aviation ramp areas in the vicinity of the proposed Runway 1432. The soil sample data presented in Section 6.6.4.1 cannot be considered potentially representative of any of the proposed construction areas. 85.152

Massport has indicated that the principal means of disposal of excavated material will be as landfill cover and contouring material. Experience with other projects demonstrates that the Central Artery Project has substantially saturated the demand for materials for those purposes within reasonable haul distances. While the shortage of capacity will principally be a cost factor, it could also affect proposed construction schedules. 85.153

Without information on the source of the hydraulic fill in the eastern portion of the airfield (Taxiway Delta Extension Section 6.6.4.3), no assumption should be made about the chemical characteristics of the underlying material. 85.154

The total volume of soil to be disposed of, from the DEIS/DEIR, appears to be a minimum of approximately 800,000 cubic yards, and depending on the results of field sampling prior to construction, could be considerably greater. Generation of the bulk of this material would occur in the first two years of the project. While this volume is less than 10% of the total volume of material that is being managed as part of the Central Artery Project, its management and disposal is a significant program. The DEIS/DEIR treats this matter far too casually. 85.155

D.6 Construction Impacts

D.6.a Construction Activities

The statement that construction work with limited exception would only occur during the months of January, February and March, weather permitting, is puzzling. It is not consistent with Table 6.7-3; it is not clear why Massport would select two of the months that are normally the most problematic because of weather, and years 2, 3, 4 and 5 in Table 6.7-3 specifically show no construction activity in the first quarter. This matter needs to be clarified. 85.156

It is apparent from the construction schedule that Massport intends to first implement its capacity enhancement projects, Runway 14/32 and the Centerfield Taxiway.

D.6.b Ground Transportation

Massport should explain how construction workers would access the site, based on experience with other recent Massport construction projects. Will contractors be required to provide off-airport worker parking with shuttle buses to the airfield construction site? How will the potential for parking, legal or otherwise, in East Boston be minimized? (Page 6-129) 85.157

D.6.c Air Quality - Fugitive Dust during Construction

The most likely sources of fugitive dust during construction are wind erosion of exposed soils and dust re-entrainment during vehicle passage. The areas most likely to be affected by fugitive dust are those within a few thousand feet of soil movement and transport activities, such as Court Park in Winthrop, Bayswater Street and Jefferies Point, and the South Boston Waterfront, including Fort Independence. Massport proposes street sweeping and wheel-well washing, and use of water sprays, to minimize dust generation. These are reasonably effective measures if implemented in a proper manner and at a proper place. However, it is assumed that Massport will not construct and operate wheelwash facilities on the airfield, but rather, will establish them at the southerly end of Harborside Drive and perhaps at the North Gate (although locations are not mentioned in the DEIS/DEIR). To minimize dust generation on the airfield, Massport must use spray trucks or "water wagons." However, such systems, and wheelwash operations, are not feasible during sub-freezing weather without the (costly) addition of chemical freezing point depressants to the water. Massport has failed to demonstrate how fugitive dust emissions from construction operations on the airfield during winter months will be controlled. 85.158

Wheelwash facilities generate considerable quantities of silt and sediment-laden water. Massport has not discussed how discharge of these contaminants will be controlled. Settling methods or "sedimentation boxes" are ineffective with respect to fine particles in the water stream. 85.159

D.6.d Construction Noise Impact

Massport proposes to use the Federal FHWA Criteria for construction noise impact. Massport fails to recognize the criteria applied by Massachusetts Department of Environmental Protection, which limit construction noise increases to 10 dB(A) above background and prohibit pure tones as defined by DEP (DEP Policy 90-001). These criteria are applicable to this project. 85.160

Other shortcomings of the Massport construction noise analysis are its failure to address the matter of pure tones and of impact noise (*i.e.*, paving breakers and 85.161

hoe rams), and the failure to separate out and separately analyze nighttime construction noise levels against nighttime ambient levels, in addition to the information on projected day DNL levels in Table 6.7-6.

Should this project be finally approved, the Record of Decision and the Section 61 Findings should clearly incorporate the construction impact mitigation measures set forth in Section 6.7 of Volume I of the DEIS/DEIR, as amended by any additional measures incorporated as a result of these or other comments.

How will construction vehicles accessing or exiting via the North Gate be precluded from use of local streets? 85.162

The Soils Use Policy and the Stormwater Pollution Prevention Plan (Section 6.7.5.4) should be available for and subject to public review and comment. 85.163

D.7 Cumulative Impacts

The statement is made, "After sound-proofing to mitigate impacts within the 65 YDNL Contour, the full-build alternatives provide net long-term benefits." We disagree with this statement. As discussed elsewhere in these comments, the soundproofing program has significant limitations in terms of the benefits provided. 85.164

There is potential for adverse odor impacts in certain areas proximate to the airport, as a result of this project. The proposed Airside Improvement Project provides minimal long-term air quality benefits. With the exception of odor impacts, changes in air quality associated with the proposed project are likely to be undetectable. 85.165

The statement expressing total peak construction trips as a percentage of the average annual daily traffic on the regional highway system is misleading, since most of the construction-related traffic consists of heavy vehicles. These vehicles have significantly greater traffic impacts than do passenger vehicles. 85.166

This Draft Environmental Impact Report is submitted subject to Massachusetts laws, policies and regulations, in addition to federal regulations and guidance (page 7-3). As such, it is subject to the determination of the Secretary of Environmental Affairs as to whether cumulative impacts have been adequately addressed.

Federal planning policy[5] establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan. The DEIS/DEIR makes a clearly contrary statement (page 7-3): "The Airside Project has independent utility, and will not stimulate, preclude, or otherwise . . . " In our opinion, this statement is incorrect. 85.167

D.7.a Relationship to the GEIR

The planning period is inadequate, and should be extended to 2020. There is no plan or program to deal with long-term growth at Logan, which will soon overwhelm any interim benefits of this project. There are measures that could be instituted to effectively address transportation in eastern New England, but there is no discussion in this document. 85.168 85.169

As stated above, the Secretary of Environmental Affairs should determine that these significant planning deficiencies exist in the DEIS/DEIR that must be addressed. The DEIS/DEIR should be found inadequate, and a new Draft document should be required. 85.170

Delay does not appear to be a major problem at Logan, based on FAA reports and Massport's 5-year history of inaction. 85.171

D.7.b Relationship to Other Logan Projects

This project and landside projects at Logan are interdependent, and both will increase capacity and stimulate demand. 85.172

D.7.c Long-Term Cumulative Effects

The Airside Improvements Project is already "divisive and disruptive of established communities," and prospects for the long term are significantly worse. 85.173

With respect to Section 7.3.1 - Noise - it is necessary to iterate that the "sound-proofing" does not fully mitigate for the impacts of increased overflights and increased ambient noise. With respect to odor impacts that may be associated with the proposed project, we believe the modeling approach used by Massport to be flawed and to require substantial enhancement. 85.174 85.175

E. Modeling

E.1 Approach to Delay Modeling

There are a number of different models available[6] for determination of capacity and delay analysis including: LMI Runway Capacity Model, FAA Airfield Capacity Model, AND (Approximate Network Delays), The Airport Machine, SIMMOD, TAAM (Total Airspace & Airport Modeler), HERMES (Heuristic Runway Movement Event Simulation), NASPAC, TMAC, FLOWSIM, and ASCENT. It is assumed that Massport used the commercial software model "The Airport Machine" developed by Airport Simulation International (ASI) for the evaluation of the taxiway demand, capacity and delay; however, no specifics were given on the development of the model. It is curious why Massport did not use the FAA-approved SIMMOD model for the airport simulations. "The Airport Machine, which costs about $20,000 for a site license, offers less flexibility and options than SIMMOD and is a largely deterministic model."[7]

85.176

There is no discussion on the selection of the model for estimating delay. Section 1.4.1 describes two measures of delay, ATOMS and ASQP data. In 1997, according to an FAA published report[8], the FAA had two delay reporting systems, Operations Network (OPSNET) and the APO Total Cost for Air Carrier Delay Report. In addition, DOT publishes the Air Travel Consumer Report (ATCR) and the Air Transport Association issues a report on member airlines.

FAA's Office of Aviation Policy and Plans (APO) has created the "Consolidated Operations and Delay Analysis System (CODAS) to provide estimates of aircraft delay by individual flight. "APO's main objective was to develop a clear and well-supported methodology to calculate aircraft delays that will be accepted by both government and industry as valid, accurate and reliable. Because the acceptance of the CODAS delay estimates are the key to its usefulness, APO coordinated the development of CODAS with other FAA organizations and major air carriers and continues to do so."[9]

[7] Modeling Research Under NAS/ATT, "Existing and Required Modeling Capabilities for Evaluating ATM Systems and Concepts", International Center for Air Transportation, MIT, March, 1997, page 17.

[8] FAA, Office of Aviation Policy and Plans, "Documentation for the Consolidated Operations and Delay Analysis System", September 1997, page 1.

[9] FAA. Office of Aviation Policy and Plans, "Documentation for the Consolidated Operations and Delay Analysis System", September 1997, page 3

The CODAS information should be incorporated into the models developed (FLAPS and DELAYSIM) for the evaluation of the airside improvements at Logan. CODAS also calculates taxi in and out time and delay and should be considered in lieu of The Airport Machine. 85.177

It is unclear why Massport chose to develop its own model for estimating delay when FAA has developed a model to do the very same. Massport chose to use the FAA INM model for reviewing the effects of noise on the community. However, they choose to use non-standard models like the Airport Machine, DELAYSIM, and FLAPS instead of SIMMOD and CODAS. 85.178

The models used including FLAPS and DELAYSIM appear to have been developed exclusively for analysis of Logan. Background information on the development of these models is not presented. The models have not been verified or compared with historical information nor has it been shown that the development has been coordinated with FAA or the airlines. Based on 40 CFR Part 1502 requirements of preparing Environmental Impact Statements[10] " . . . Material based on proprietary data which is itself not available for review and comment shall not be incorporated by reference," this usage is inappropriate. 85.179

E.2 Airside Delay Modeling

The Airside delay model (DELAYSIM) used hourly weather observations from 1981-1990. Not only does this not correlate either to Massport's base year or to the recommended 1998 base year, it uses data that is over 17 years old. Weather patterns have changed significantly within the last five years due to effects from El Nino and La Nina. The selection of the weather data does not provide current information as background for the selection of the runway configurations. 85.180

One of the assumptions of the DELAYSIM model is that an air traffic controller first chooses 1) highest capacity configuration, then 2) the configuration that most closely meets the PRAS goals. We believe this assumption is not supported by historical data on the actual percentages of runway use configuration. No data is presented to show recent improvement due to the availability of Enhanced PRAS (EPRAS). 85.181 85.182

The DELAYSIM model should withdraw the PRAS goal decision-point as a runway configuration selection criteria and provide the model results using, as the leading criteria, the highest capacity configuration and air traffic controller workload weightings approved by FAA ATC. This approach would be a more conservative approach reflecting historical operational selections by the FAA ATC personnel. FAA's primary responsibility is to provide safe and efficient aircraft operations into 85.183

[10] Council on Environmental Quality, 40 CFR Part 1502.21

and out of Logan. To try to model the ability of FAA to adhere to a volunteer noise program (PRAS) is not appropriate in simulating the "worse-case" or "highest capacity" operations. Moreover, Logan has indicated that continued growth is expected; thus, FAA will focus on its primary responsibility of efficient aircraft operations.

It should be noted that PRAS goals have not been met by the FAA since establishment. For the model to assume the attainment of PRAS goals will improve significantly is unrealistic and underestimates the operations over specific communities. While it is important for the FAA to be encouraged to met the PRAS goals, it is impractical to consider the goals as a significant factor in FAA operational decisions. 85.184

The methodology of the DELAYSIM model as applied by Massport provides output that reflects a "best-case" though unrealistic scenario, and warps the follow-on analysis of the environmental issues. 85.185

The assumptions made by the DELAYSIM model do not account for stimulative effect that would occur if these improvements are implemented. FAA's Economic Analysis of Investment and Regulatory Decisions - Revised Guide provides specific guidance regarding the evaluation of delay and the stimulative effect that reducing delay will have by increasing demand. The following is for review from this document: 85.186

"Capacity Increases which Reduce Congestion Related Delay - Two definitions of capacity are relevant in defining the relationship (between delay, capacity and system demand). One is the "through put" measure. It defines the absolute number of system users that can be served in a given period of time, provided that a user is always present waiting to use the system. The second measure is that of "practical' capacity. It provides a measure of the ability of a given system to accommodate users subject to some maximum acceptable level of delay. ....Average delay is low at low levels of demand and increases as demand approaches capacity, as defined under either definition. As demand exceeds "practical" capacity, delay exceeds the acceptable level. And as demand pushes up against "throughput" capacity, delays begin to become infinite. This occurs because the number of users demanding service, per time period, begins to become greater than the ability of the system to serve them, resulting in an ever growing line of users waiting for service.

It is important to note that delays begin to occur before capacity, under either definition, is reached. This happens because of the random nature in which system users demand services. If all users of a system consistently arrived at evenly spaced intervals, the system could provide service hourly to a number of users equal to the "through put" capacity rate. No delay would occur until "through put" capacity was

actually exceeded. In actuality, system users do not arrive consistently at evenly spaced intervals. Sometimes several users arrive at one time and sometimes no one arrives. As a consequence, some of those who arrive at the same time as do others must be delayed.

Measurement of capacity and delay benefits requires that the relationship depicted in Figure 3-2 be determined for both the existing system and the proposed new one. The general form of such relationships is shown in Figure 3-3. Each has the same general form as that of Figure 3-2, but with the proposed new system having greater capacity and lower average delays that the old one at each level of demand. 85.187

The average delay reduction per system user at the current level of demand, Do, is Mo-M1 minutes. This is not the delay reduction that will occur if the indicated capacity increase is provided at demand level D1 after system users have adjusted to the increase, however. Capacity improvements will reduce the costs of using the system both in terms of passenger time and aircraft operating expense.

As indicated in Figure 3-1, cost reductions will generally lead to an increase in the quantity of any good or service demanded. In this case, assume system demand increases from Do to D1 resulting in delay of M2 per user. This level of delay is above M1 and represents that level which will result from the indicated increase in capacity once demand has adjusted to the lower costs brought about by the capacity increase."[11]

The DELAYSIM model does not take into account the capacity increase because of stimulated demand. This model also provides a higher value of delay savings because it is measuring the savings from Mo-M1 and not Mo-M2. Since FAA includes recognition of the stimulation effect in determining delay reduction, the model Massport uses should do the same. 85.188

The FAA Technical Center at Atlantic City, New Jersey, should assist in simulating operations of the proposed new runway to verify the validity of the sole-source models used by Massport. 85.189

F. Delay

F.1 Introduction

Massport proposes addressing the delay problem in a limited way through the Airside Improvements Project, and to address impacts of ground traffic through increasing the usage of high-occupancy vehicles and through regional transportation improvements by others. However, Massport's Airside Improvement Project proposals will not preclude increases in the delay experienced by airlines and their passengers. By its own calculations, that delay under the most optimistic scenario will return to present levels within a very few years and increase after that. 85.190

The cited 1998 121,000 hours of delay equates to over 13 years of delay to a single aircraft. If this delay is divided among 10 air carriers, it equates to the operating expenses of one multi-engine passenger jet operating 24 hours a day for 1.3 years for each of the airlines. If these were true delays, many of the airlines involved in this area would already have found alternatives to operating from Boston.

The analysis of delay shows a 10 percent reduction in modeled delay for 1999 with implementation of Option 1A unless the air traffic increases to a projected higher number, in which case the projected delay will be above that modeled for 1998 traffic. Actual air traffic will likely fall somewhere between the two, and the delay for 1999 is likely to approximate that estimated for 1998. By 2010 projections, with all improvements completed and a low air traffic projection, runway delays are estimated to be approximately 171,900 hours, or 40 per cent more hours of delay than those estimated to have occurred in 1998. In view of these projections, it is apparent that building and operating an unidirectional Runway 14/32 is but a band-aid.

The DEIS/DEIR statement that if no actions are taken, Logan's annual runway and taxiway delays will rise from today's modeled level to a modeled level exceeding 596,000 hours in the 2010 45M High Fleet scenario ignores the multitude of other factors that would affect industry and passenger decisions. The modeling scenario of 596,000 hours for 656,000 forecast operations would have one believe that all flights would be delayed an average of 53 minutes per flight. The forecast delays, if all actions are taken, will still be double the 1999 forecast levels, or an approximate average of 21 minutes per flight. 85.191

Although expenditure of these funds to patch the Logan airfield may reduce forecast delays compare to the "no action" alternative, the delays will still be insurmountable. What will happen in 2010? Will Massport be back with another "patch" or will the visionaries realize that you can only patch something so many times and then something new has to be done? This was and is now the case in the Washington, DC area with Washington National and Washington Dulles Airports, with Houston

Intercontinental and Houston Hobby, with Dallas Love Field and Dallas/Fort Worth airport, with the New York City airports, with Chicago, etc. The cities and airports have continued to flourish with both the old and new airports. It has been proven that major cities can support more than one airport and that the older airports continue to thrive.

F.2 Calculation of Delay

The DEIS/DEIR indicates that the FAA's congestion threshold of 20,000 annual hours is used to identify severely congested (i.e., delay prone) airports. In 1997 and 1998, FAA[15] reported total operations delayed more than 15 minutes were 12,500 and 16,400; respectively.

The DEIS/DEIR indicates that "in 1998, it is estimated that Logan experienced approximately 121,000 hours of runway delay," this information is referenced between information on FAA OPSNET statistics and FAA's congestion threshold. In fact, the 121,000 hours of delay was generated by Massport's model and not by FAA. Presentation of this data, without reference, is misleading. 85.192

Information is provided on the delay as tracked by FAA, and Table 1.4-1 presents Logan's delay rank among U.S. Airports. It is useful to review this information, and a summary of the OPSNET information for the top ten delayed airports is presented in Tables 7 and 8.

In Table 8, delays due to equipment result from non-operating air traffic control equipment (not airline equipment); delays due to volume are included from both terminal volume and center volume; delays due to runways include closed runway for repair or reconstruction; delays due to weather "are largely the result of instrument approach procedures that are much more restrictive than the visual procedures in effect during better weather conditions. During the past few years, the FAA has developed new, capacity-producing approach procedures that take advantage of improving technology."[16]

[18] FAA Air Traffic Operations Managements System - OPSNET for the 55 Select Airports Calendar Year Comparison.

[19] FAA Air Traffic Operations Managements System - OPSNET for the 55 Select Airports Calendar Year Comparison.

FAA calculated and reported delay at Logan has decreased almost 19% between 1993 and 1998. This information is not in DEIS/DEIR. This reduction in delay has occurred without the implementation of any of the airside improvements proposed in the DEIS/DEIR. 85.193

Also the DEIS/DEIR indicates that FAA identifies a 20,000 annual hour threshold for identifying delay problems at airports. In 1997, delay hours measured by FAA were 25,190 hours. The DEIS/DEIR indicates that Logan's delay is six times the FAA's threshold; however, this analysis is flawed since the 121,000 hours of delay are measured by a different method than FAA's measurement. Again, Massport chose to portray the information in a misleading way. 85.194

The DEIS/DEIR indicates that the FAA ATOMS method understates total delay since delays of less than 15 minutes are not recorded. However, the DELAYSIM, the model used for the Logan Airside Planning Project, overestimates the amount of delay hours. 85.195

Over scheduling of capacity is also a by-product of airline marketing tactics. Should over scheduling of Logan's capacity occur, resultant delays would be compounded by and become more evident when wind and weather conditions add to the delay impact. There is no configuration available at any airport that can handle such a situation without delays. Until airline marketing personnel change their mind set, delays are inevitable. Even airports with three sets of parallel runways incur delays brought about by over scheduling. It is important to note that although this over scheduling is given as a scenario, airline schedules are now such that in no hour is the normal three runway capacity at Boston Logan airport exceeded by scheduled flights.

F.3 Cost of Delay

Cost of Delay is a subjective term. Massport exaggerates the cost of delay to airport users (airlines) and airport passengers. First, the DELAYSIM model overestimates delay hours by counting cancelled flights (where costs would not be minimized from other delays). 85.196

For airline passengers, the DELAYSIM model calculates all delay. Airline schedules take into account typical delay times when publishing departure and arrival information. Thus, airline passengers idea of delay (according to the OAG data) is different and substantially less than assumed by Massport using DELAYSIM delay hours. Moreover, the travelling public accepts some delay time when using air travel. The delay to an airline passenger is time over and above the acceptable delay measuring stick. Massport also assumes that all passengers can be represented by a single "representative passenger" when economically there are different economic values for business versus pleasure travellers. 85.197

The document quotes a value of $ 27 per hour of time from the 1997 APO Bulletin; however this document further details categories for personal and business travel as well as a low and high sensitivity range or each category. The generalized use of $27 per passenger overestimates the value of delay for airline passengers at Logan. 85.198

Massport did not present the cost of delay information in any meetings with the CAC or its consultants. In fact, they indicated cost information would not be provided except the initial construction cost of the project. 85.199

Massport overestimates the costs to airlines and passengers. Information should not be reflected unless a more detailed cost-benefit analysis is conducted. Massport presents only costs to airlines and their passengers. If cost information is to be presented as part of the analysis process for the DEIS/DEIR, a full cost-benefit analysis should be provided. Providing only part of the story is misleading. 85.200

As stated in 40 CFR Part 1502 Environmental Impact Statements regarding cost-benefit analysis[20]: "If a cost-benefit analysis relevant to the choice among environmentally different alternatives is being considered for the proposed actions, it shall be incorporated by reference or appended to the statement as an aid in evaluating the environmental consequences. To assess the adequacy of compliance with sec. 102(2)(B) of the Act the statement shall, when a cost-benefit analysis is prepared, discuss the relationship between that analysis and any analysis of unquantified environmental impacts, values, and amenities. For purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations In any event, an environmental impact statement should at least indicate those considerations, including factors not related to environmental quality, which are likely to be relevant and important to a decision."

F.4 Aircraft Delay and Runway Use Results

The Airside Improvements Feasibility Study (dated July 1995) addressed the anticipated level of flight delays if no measures were enacted to improve operating efficiency. The DEIS/DEIR indicates that "1998 delays are less than those experienced in 1993." Thus, the selection and justification of 1993 as the base year for the development of an DEIS/DEIR report (dated February 1999) is inappropriate based on a) existing conditions and b) results of prior studies. It is inconceivable that an airport delay analysis presented in 1999 would use a base year that is five years old. Massport chose to delay submittal of the DEIS/DEIR until early 1999, and should be required to provide analyses that are appropriate to forecasting techniques based on recent (not five year old data). Massport is presenting information based on five year 85.201 85.202

[20] Council on Environmental Quality, 40 CFR Part 1502.23

old data and analyzing the results for only a ten year period in the future. This is not an acceptable approach to the delay analysis.

Moreover, the DEIS/DEIR indicates that analysis was provided for the base year; yet Table 4.5-1 does not indicate the total delay hours for 1993 for the five forecast scenarios for each of the proposed Logan Airside Improvement Packages. The statement that "1998 delays are less than those experienced in 1993" points up the flaws with the forecasting of delay using the methodology and approach presented in the DEIS/DEIR. *(Note: Table 4.5-1 does not label the Alt. 1 vs Alt 4 & Alt. 1A vs. Alt 4 as delay reduction.)*

85.203

85.204

F.4.a Total Delays

The document compares the FAA delay threshold to Massport's model and indicates that FAA's threshold is to be exceeded by eight times. This comparison is inappropriate since the measures of delay are not the same (FAA's definition of delay is significantly different than Massport's model). This statement misleads the reader to think that FAA's threshold is being exceed by a factor of eight when, in fact FAA only counts delay hours over 15 minutes and Massport's model counts every minute of delay.

85.205

Again, in this section the DEIS/DEIR puts a value on the delay savings that is inappropriate and inaccurate. An interesting comparison should be noted:

85.206

1993 Base Year	159,000 modeled delay hours
1999 29M Low	157,500 modeled delay hours
Delay Reduction:	almost 1 %
No Action:	almost 1%

F.4.b Runway Related Delays

The DEIS/DEIR states that implementation of Alternative 1 or 1A will substantially reduce the growth in delays occurring in VFR conditions. It should be noted that the key points presented in Chapter 1 (point 5) indicate the "principal cause of delay at Logan is the substantial drop in airfield capacity that occurs when wind and weather conditions force controllers to utilize configurations with fewer than three runways or when poor weather requires increased separation distances between aircraft." These conditions occur during IFR conditions, thus the implementation of Alternative 1 or 1A is not just providing reduction in weather related delay but is providing additional capacity during VFR conditions. While the peak hour capacity does not increase with construction of the runway, the additional runway will provide the controllers the option to use higher-capacity configuration more of the time. This ability is providing additional "through-put" of aircraft operations.

85.207

The guise of constructing the new runway to reduce weather related delays actually has the effect of increasing the all weather capacity of the airport; thus allowing for additional through-put of aircraft operations than without the new runway. If as the DEIS/DEIR states, there are delay savings realized by this delay reduction, then there is also a stimulation of air travel demand (caused by the market forces of lowering prices). This stimulation is not reflected in the annual hours of delay calculations. 85.208

F.4.c Taxiway-Related Delay

The DEIS/DEIR puts a value on the delay savings that is inappropriate and inaccurate. Please see comments under "Cost of Delay."

F.4.d Runway Use

Figure 4.5-3 Distribution of Jet Aircraft Operations by Operating Direction illustrates 1997 actual data. 1997 is not the base year. 85.209

The discussion of runway use fails to highlight that it is FAA controllers who make the decisions regarding the runway configuration that is selected. The DEIS/DEIR assumes that FAA controllers would select the a) highest capacity configuration b) meeting of PRAS goals. This assumption has not been historically proved to be true. 85.210

The section "Revised Wake-Vortex Turbulence Rules" implies that the "new"" wake turbulence rules require one aircraft to follow the other at the stated distances. These rules are applicable **only** to Air Traffic Controllers for providing required spacings between aircraft for following and crossing traffic. The distances behind large and heavy aircraft are those that air traffic will use to provide initial separation until other separations, such as visual separation, can be applied. These rules are not applicable to a pilot who chooses to follow another aircraft visually. This information is verified through the FAR 91 Flight Rules, appropriate advisory circulars, and the Air Traffic Control Handbook, 7110.65L and revisions. A prudent pilot, when operating in VFR conditions behind a larger or heavy aircraft, will adjust his path behind the aircraft to ensure a safe flight. 85.211

F.5 Delay Conclusion

Page 4-41 describes 1998 annual delay as 143,000 hours where as Page 1-12 describes 1998 annual delay as 128,000 hours. These are modeled hours, a product of "DELAYSIM", not measured hour or "FAA" hours. 85.212

The use of 1998 data rather than 1993 data strengthens the argument that the "base Year" must be revised. 85.213

According to the FAA, operations delayed over 15 minutes in 1998 totalled 16,400[21]. At a minimum this would be 16,400 operations @ 15 minutes / 60 minutes per hour or 4,100 total delay hours. At a maximum, assuming that delays over five hours are canceled, the annual delay would be 16,400 operations @ 5 hours or 82,000 total delay hours. Now, obviously, this is a simplistic method of applying the FAA reported data since all of reported delays are over 15 minutes (since it is the minimum threshold for reporting) and not all the reported delays will be five hours. However, using this basic approach, delay hours would be between 4,100 hours and 82,000 hours. These figures are substantially lower than the DELAYSIM model and bring into question the validity of the methodology and approach. 85.214

[21] FAA Air Traffic Operations Managements System - OPSNET for the 55 Select Airports Calendar Year Comparison.

G. Alternatives

Massport has not met the requirements of the 40 CFR Part 1502 Environmental Impact Statements regarding "alternatives including the proposed action" for this DEIS/DEIR which require[22]: "Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated" and "Include reasonable not within the jurisdiction of the lead agency."

No discussion of alternatives not considered in this DEIS/DEIR was included. A reasonable person could expect alternatives to include the following:

a. Development of a new airport to accommodate demand and reduce delays at Logan 85.215
b. Consideration of Implementing a High-Density Rule (Slots) to control congestion at Logan. " In order to avoid excessive congestion at several of the nation's airports, access is capped through regulations which establish a fixed number of landing and takeoff rights ("slots")."[23] 85.216
c. Consider Implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions for Stage 2 and Stage 3 operations at Logan to provide noise relief to affected communities. A specific measure that could be considered is a cap on night-time operations. 85.217
d. Diversion of general aviation traffic and origin/destination traffic of both regional non-jet and short-haul jet traffic to Massport's Hanscom Field. 85.218

At the present time, Massport presents only a limited suite of measures that could be effective in addressing this issue. The general approaches that could be implemented that have not been forestalled by other actions, and are not mutually exclusive are discussed below. However, the political will has not been demonstrated for the required combination of a level of commitment and of supporting measures sufficient to prevent the growth of aircraft impact at and around Logan Airport.

G.1 Regional Airports

Diversion of passengers to other airports has major potential to absorb current and future growth in air travel demand of the Boston Metropolitan and eastern New England areas. Hanscom Field, T. F. Green, Manchester, Worcester and potentially Pease, are the candidate facilities. Massport has made an effort to evaluate the potential for such diversion, and some of the recent growth in travel through those airports has certainly been from passengers who could and would otherwise have

[22] Council on Environmental Quality, 40 CFR Part 1502.14

[23] FAA-APO-98-4, "Economic Analysis of Investment and Regulatory Decisions -- Revised Guide", Chapter 3, "Benefit Estimation", e-4 "Regulatory Changes in Capacity at Access Capped Airports", page 3-22.

utilized Logan. However, those airports do not now offer the full suite of services and destinations available to and from Logan. Without additional support and stimulation it is unlikely they will. Therefore, if market forces are left to drive growth in traffic at those airports, growth at Logan will not be significantly constrained. Specific goals would have to be established, and a series of measures implemented to stimulate shift of traffic demand from Logan.

Hanscom Field is owned and operated by Massport. We believe it has significant potential to absorb passenger traffic that does not seek connections to other flights, i.e., Origin & Destination traffic to and from the Boston Metropolitan area. Many "General Aviation" corporate flights, and some "Regional Non-jet" and "short-haul" jet traffic could find Hanscom an attractive alternative to Logan if appropriate services and facilities were provided and a marketing campaign implemented. Hanscom has the capacity to handle an additional 40-50,000 operations annually, even if current operations including 'touch and go' are not modified. 85.219

The only mention of a Second Major Airport in the DEIS/DEIR is the information presented on the 1991 MAC Second Major Airport Siting Study. This study which concluded that it would take at least 10 years of planning from site selection to construction indicated it was not a solution for the next decade and a half. Logan's airside improvements are to be implemented, if on the schedule presented, by the beginning of 2005. Does not the very conclusion of the Second Major Airport study point out that long term considerations to meet increasing demand require that a second airport (either a greenfield airport and/or significant expansion of an existing airport) be an alternative to the improvements recommended? 85.220

Per 40 CFR Part 1502 Environmental Impact Statements regarding alternatives including the proposed action: "In this section: Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated. Include reasonable not within the jurisdiction of the lead agency."[24]

The ENF Certificate dated November 22, 1999 cited that the alternatives analysis must be broadened to include off-airport alternatives[25]. Although Massport includes some options off-airport, the development of another air carrier airport has not been reasonably discussed nor have the reasons for its elimination as an option. 85.221

The fact that Massport does not provide long-term planning forecasts (at least 20 years from submission of DEIS/DEIR) teamed with its inability to provide as an

[24] Council on Environmental Quality, 40 CFR Part 1502.14

[25] ENF Certificate dated November 22, 1995, page 3, last line of alternatives section.

option the development of a second airport highlights the short-sightedness of the long term development.

85.222

Per 40 CFR Part 1502 Environmental Impact Statements regarding purpose requires that [26]: " . . . It shall provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment." In the case of many of the close-in neighborhoods, the option for a second airport is reasonable to minimize adverse impacts on their quality of life.

The presentation of the potential diversion of Logan passengers due the alternatives of regional airport use, rail use and video and online conference use are indicated to be the same at a 45M forecast level and a 37.5M forecast level. It is unclear why if almost 20% of passengers would use these alternate modes at 37.5M demand level, why at a higher passenger demand level, more passengers would be diverted to these alternate modes at a 45M forecast level.

85.223

One of the assumptions regarding the recapture rate from the analysis described in Table 2.4-4 is that the estimated service area of the alternate airports remains the same in 2010 as it is in 1994. This is not an accurate assumption since the service areas for each of these airports will grow significantly as they improve air service routes and frequencies. Massport fails to list Hanscom Airport as a potential diversion airport.

85.224

85.225

Massport projects a relatively small potential for shifts of transportation and communication demand away from Logan Airport as a result of use of high-speed rail, other regional airports, and telecommunications. These shifts do not, according to Massport, come anywhere near absorbing the projected growth in passenger demand.

The Massport Logan Community Advisory Committee (CAC) argues that the incursions of Massport and Logan upon the communities must be rolled back. This can only be accomplished by deterring air traffic growth at Logan Airport. This is a regional problem demanding of regional solutions. While Massport has taken preliminary steps in this direction, the overall effort and the present potential are seriously inadequate. The New England governors, the FAA, and the Federal Highway Administration must assist state government and the Boston Area communities in devising and implementing programs to ensure that Massport's numbers grow no larger, while not inhibiting normal beneficial economic growth of Eastern New England. The Airside Improvement Project must be viewed in this larger regional context. It is not just a set of projects designed to reduce airside delays and improve safety.

85.226

[26] Council on Environmental Quality, 40 CFR Part 1502.1

G.2 Peak Hour Pricing

Congestion pricing, peak-period pricing and techniques that base landing fees on functional categories relating to operations (landing or take-offs, weight (or size) of aircraft, and capacity to meet peak period demand could be particularly useful in reducing delays. The basic assumption was made that peak period pricing needed to be revenue neutral, pertaining only to airfield revenue and airfield costs at Logan. This assumption resulted in impacts to airlines that operate small aircraft only. Should airfield costs to develop capacity enhancement supporting Logan (i.e., an alternate airport) be allowed, then the results would have an affect on larger aircraft and the results would provide additional delay reduction. 85.227

A properly-designed and implemented form of congestion pricing, among the alternatives under consideration, will afford a great degree of delay reduction at Logan, for a given investment. Massport's previous experience with regulatory challenges in implementing a demand management technique has affected the assumptions of the model developed. 85.228

Consideration should be given to a quite different approach to addressing the efficiency of Logan Airport during peak operating periods and in carrying out its primary mission. In a simple form, the mission of the airport might be defined as "the accommodation of as many passengers as feasible under existing conditions with a minimum of delay" with some stated commitments to minimizing impacts of operations. The measure of efficiency presently used by Massport and the FAA relates to numbers of aircraft operations handled in specific periods (i.e., per hour); and the hours of delay experienced in handling those operations. Massport's efforts have focused on operational and facility expansion approaches to increase the capacity for total aircraft operations under restrictive conditions. *Refer to Appendix C for additional discussion of alternative approaches to peak hour pricing.*

If the aircraft passenger is identified as the "unit of concern" in the airport's primary mission, the fundamental measure of efficiency and the principal objective of the airport would be to maximize the number of passengers transiting the airfield per hour. If maximizing the throughput of passengers was the dominant objective of the management and operation of the airport facilities under the control of Massport, the measures considered might differ from the current models. 85.229

One approach might be to use the hourly integral of aircraft type/seat capacity adjusted by the current or projected average load factor for each aircraft type and operator or route. To maximize facility efficiency and to provide the maximum feasible throughput of passengers during critical periods, Massport could through defined mechanisms encourage or give preference to the use of its facilities under its control (i.e., gates, hold rooms, terminals) during critical periods by aircraft and

operators providing service to the greatest number of passengers. Massport would apply this approach through lease terms and operating agreements with its lessees and aircraft operators.

Massport's model for peak hour pricing has chosen too narrow a definition of the regulatory criteria it must meet to establish a peak hour pricing structure. It also has chosen a higher operational threshold (115 operations) which underestimates the delay reduction capabilities of peak hour pricing. 85.230 85.231

Massport chose varying data information, both 1993 and 1995 flight schedules, for modeling the peak hour pricing simulations. Massport has again, chosen the input of information which will provide the output it expects. 85.232

The option of utilizing "costing" (including peak period pricing) approaches for the purpose of delay reduction should be retained. It should be the first option selected for implementation, as a non-capital intensive, adjustable measure to move toward a goal. 85.233

G.3 Other Alternatives

A shift away from air travel through reliance on other means of travel or communication is essential. Vigorous measures to foster and encourage this shift should be undertaken by State government in cooperation with Amtrak and telecommunications providers. 85.234

High-speed rail in the Northeast Corridor and telecommunications as a substitute for business travel is briefly explored in the DEIS/DEIR. Should energy cost and availability become a much more significant factor in the cost of air travel, these measures would become increasingly attractive and effective to divert Logan passenger load. Neither is effective in absorbing vacation travel demand, which particularly contributes to peak-period loading.

Massport has worked to reduce automobile travel to and from Logan Airport by providing and encouraging use of short-range mass transport. Rail and bus transportation could also replace some of the short-haul feeder/distributor traffic at Logan. Much of this traffic in smaller aircraft is the most likely to be squeezed out as economic measures are applied to address future congestion at the airport. Furthermore, these smaller aircraft do not create significant community impacts. Their presence and operations are primarily a concern to Massport and the airlines as a significant factor in airfield and air space congestion and as a factor in creating equity of access among passengers.

H. Benefit-Cost Analysis

The development of the preferred alternative is anticipated to cost over $60 million (presumably in 1998 dollars although this information is not provided in Table 6.7-2) plus planning, engineering, and resident inspection fees likely adding at least an additional 30% to the construction for a total project cost of around $80 million. No indication of how the project is to be financed is provided in the DEIS/DEIR document. This information should be discussed as it may be relevant to the alternative selection. 85.235

FAA legislation requires that airport sponsors conduct a benefit-cost analysis for capacity-related airport projects, particularly when the sponsor anticipates the need for $5 million or more in Airport Improvement Program discretionary grants, or any capacity project for which an letter on intent is sought.[27] Table 8.8-1 does not include the benefit-cost analysis as part of the anticipated permits and approvals required by the FAA. This is obviously a critical oversight since the valuation of both benefits and costs including dis-benefits to affect communities that provide the economic justification of this project is also missing from the DEIS/DEIR. 85.236

Massport indicates there are environmental benefits with implementation of the various alternatives. However, there is no economic analysis of the noise impacts regarding the various alternatives. Massport should be required to identify the specific dis-benefits for the various alternatives proposed as stated in the following FAA-APO document[28]: "Noise Reduction - The provision of air transportation services generates noise which imposes costs or dis-benefits on those who are subjected to this noise. Government investments which promote aviation may have the accompanying effect of increasing aircraft noise. Government activities have been undertaken to reduce aircraft-generated noise. The benefits of noise mitigation activities are the reductions in noise-produced costs which the activities achieve. These noise related costs and benefits should be addressed in economic analyses of activities which result in increases or decreases in aircraft noise. Although it is possible to establish a conceptual framework which correctly measures the social cost of aircraft noise, deriving empirical estimates for such a framework is a difficult undertaking requiring numerous assumptions and estimation compromises." 85.237

I. Airfield Layout & Utilization

I.1 R/W 14/32 Layout Options

The selected preferred layout option for "unidirectional" Runway 14/32 is Option C. (See page 3-28.) Option C is a 5,000-foot runway shifted slightly to the southeast along the centerline so that a small portion of the approach runway safety area is over water (rather than filling or creating a deck (Option B)). This will require a "Modification of Conditions" by the FAA. The discussion of this as a feasible option did not include a discussion of aborted takeoffs in the 14 direction, and whether the reduced safety overrun would be approvable under that scenario. If the runway cannot be so shifted, Option A or a shorter runway would be the only viable option. Option A has a significant impact on Hyatt parking, as it would require a substantial reduction in that parking for which there appears to be no alternative. If this project is to proceed to the Final EIS/EIR stage, there should be a determination by FAA that Option C will be permitted. 85.238

The DEIS/DEIR refers to a crosswind being a determining factor in runway availability. A statement is made (on Page 3-7) that ". . . runways at Logan are only available if there is a tailwind of less than seven knots and a crosswind of less than 20 knots."" This statement is inaccurate since the criteria is "a crosswind component of 20 knots" as the determining factor. A wind at a 45 degree angle across a runway at approximately 30 knots can equate to approximately an 18 knot crosswind. Other contributing causes to a crosswind being a factor for runway selection are airline regulations, pilot proficiency and preferences, and aircraft types and capabilities. 85.239

I.2 Taxiway Improvements

The summary of advantages cited for the Centerfield Taxiway (page 3-29) supports the community concern that the presence of the Centerfield Taxiway will make the use of the 4/22 runway combinations more attractive and therefore will tend to strengthen the bias of the tower toward use of those runways. Not only would this operate contrary to the goal of shifting operations from those runways, it would increase the tendency to stack aircraft in the northern section of the airfield. 85.240

I.3 Modifications to Standards

The preferred alternative recommendation does not state which runway option is being recommended. If as page 3-28 indicates, Option C is the preferred layout option for the runway, then it is critical to note that this option would require a modification to standard from the FAA regarding the runway safety area. 85.241

The discussion of Option C does not evaluate the potential of declared distances or displaced thresholds in lieu of requesting a modification to standard. Option C would require a modification to standards for: 85.242

* Penetration of FAR Part 77 for Harborside Drive
* Penetration of FAR Part 77 Transition Surface for Hyatt and Buildings 56&57
* Part of the Runway Safety Area is over the water

I.4 Aircraft Type Proposed to Use Runway 14-32

In Section 3.2.2.4 (page 3-24), there is a very brief discussion of the type and size of aircraft that will typically use the proposed new runway compared to the aircraft of maximum size that could use the runway. The aircraft mix projected to use Runway 14/32 that was used in the noise analyses should be stated, and justified. If the mix so used excludes certain aircraft based on landing or takeoff requirements this should be stated. If the mix so used includes a lesser proportion of certain other aircraft than does the Logan fleet mix this should be stated and justified. 85.243

The justification on Page 3-24, that only regional and commuter aircraft will use the runway is not consistent with the Airport Design Category (ARC) selected for the Runway which is C-III[29]. C-III aircraft[30] include the following: 85.244

* Airbus A-320-1000
* BAC 111-200, -300, -400 & -475
* Boeing 727-100 & -200
* Boeing 737-100, -200, -300, -400 & -500
* Fokker F-28-3000 & -4000
* MDC DC-9-10, -15, -20, -30, -40 & -50
* MDC DC-9-80 & -82

I.5 Procedures

Page 3-12 indicates that the approach procedure is to be a non-precision approach for proposed Runway 14/32. However, page 3-14 indicates that future use of a Global Positioning System could require a 1,000 ft wide primary surface. This 1,000 ft primary surface would be required for a precision instrument approach. Page 3-24 indicates that NAVAIDS for Runway 32 will consist of a localizer and glide slope for precision guidance. This is in direct conflict with the statement on Page 3-12 indicating a non-precision approach. It appears that Massport is presenting the

[29] DEIS/DEIR, Page 3-11

[30] FAA Advisory Circular 150/5300-13CHG4, Appendix 13

proposed runway as a non-precision runway used only by commuter aircraft. However, it is obvious that long-range plans include precision instrument capabilities and operations by a variety of large jet aircraft.

85.245

The DEIS/DEIR should clarify both the short and long term NAVAIDS being considered for the proposed runway. Deviations to standard should be included for the long term NAVAIDS with precision instrument capabilities (either ILS or GPS equipment) to illustrate the long term implication of the runway. As stated in 40 CFR Part 1502 Environmental Impact Statements regarding unavailable information[31]: "If the information relevant to adverse impacts is essential to a reasoned choice among alternatives and is not known and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement." This information should be easily attainable by Massport.

I.6 Uni-directional Runway

Under the Supreme Court decision in *Griggs v. Allegheny County*, 369 U.S. 84 (1962), proprietors of the airport are liable for aircraft noise damages resulting from operations from their airport since they planned the location of the airport and the direction and length of the runways. Because they are liable for airport noise as proprietors, airport owners have limited authority to determine the "permissible level of noise" of aircraft operations under their proprietary powers. Airport owners may not use this limited authority to interfere with Federal responsibilities for flight safety and efficiency. Thus, Massport cannot, as proprietor of the airport, ensure that proposed Runway 14-32 will be uni-directional. It is also important to note that they can; however, determine the "permissible level of noise" of aircraft operations.

85.246

I.7 Future Use

Although Massport states that Runway 14/32 will be built with a non-precision approach, their discussion shows that there may be the possibility of making this a precision approach. Massport further states that Runway 14/32 is to be equipped with an ILS localizer and glide slope for instrument approaches. The approach will be considered a non-precision approach due to higher weather minima for use of this runway.

The proposed approach is to follow the precision guidance until approximately 450 feet above the airport and then proceed visually to the runway. This altitude would be reached approximately one and one half miles from the runway. The approach for this runway is proposed to be similar to those for Runway 22L and Runway 27. To change this non-precision approach to a precision approach would require three

[31] Council on Environmental Quality, 40 CFR Part 1502.22

events, of which two are physical changes. One would require the modification of the runway to medium or high intensity lighting, the second construction of approach lights for Runway 32, and the third an EIS by the FAA to lower the minima on this runway.

While precision approaches are not feasible for runways 22L and 27, they might be feasible for runway 32 with construction of a light pier similar to that on Runway 33L. If that were done, the runway combinations of arrivals on Runways 33L and 32, with departures on Runway 27, would become the highest capacity combination under IFR conditions. 85.247

J. Preferred Alternative

J.1 Key Points

The delay hours projected by Massport are the artifacts of its own model, and do not comport with the FAA's procedure for calculating delay at airports. In addition to calculating every minute of delay associated with every scheduled flight, it fails to take into account normal flight cancellation activities by airlines. Additionally, the FAA calculation and tabulation of delays at Logan over the last five years shows little change either year to year or as a trend. 85.248

The rejection of peak period pricing by Massport ignores two factors: First, that the construction project itself may increase delays marginally during the five-year construction period, although Massport pledges to avoid that effect. Second, that by the time the project is fully implemented, any delay-reduction benefits it may afford will be overcome by the projected growth in air travel operations, and conditions will be no better than now. The peak period pricing option should be implemented immediately to gain its delay-reduction benefits throughout and beyond the construction period. Massport appears reluctant to adopt a program that could adversely impact Cape Air, but we believe legal ways can be found to avoid that impact. 85.249

Layout Option C for Runway 14/32 requires the FAA to issue a "Modification of Standards." Should the FAA decline to do that, the possibility of constructing the runway, and/or the environmental impacts of constructing the runway, may change. These eventualities are not thoroughly explored in the DEIS/DEIR. 85.250

We believe there are adverse air quality impacts associated with construction of Runway 14/32 and the Centerfield Taxiway. 85.251

Residential "sound-proofing" does not fully mitigate the impacts of the increased overflights noise that would result from implementation of Alternative 1 or Alternative 1A, especially in the East Boston/Chelsea/Everett flight corridor. 85.252

The reduction in ground noise impacts claimed for Alternative 1 or Alternative 1A are almost entirely associated with a projected reduction of use of Runways 4/22. As pointed out elsewhere in this report, that benefit is likely to be short-lived, as traffic grows and the FAA controllers respond to their primary imperative of maintaining airport capacity. Further, the Centerfield Taxiway is intended to improve the performance of those runways, suggesting they are likely to continue as the primary runways. 85.253

A major element of the proposal to mitigate impacts on the state-listed upland sandpiper, that of creation of a replacement habitat on Cape Cod, appears to ignore geography and is of questionable benefit. 85.254

As stated above, we disagree with the recommendation to defer implementation of peak-period pricing. In fact, Massport does not commit to future implementation of peak-period pricing, should and when delay becomes a significant problem in its judgment. 85.255

The commitment to maintain Runway 14/32 as a unidirectional runway is clearly reversible. That, and the signal this project sends that Massport continues to be committed to expansion of Logan Airport, are the two greatest concerns of the surrounding communities. 85.256 85.257

J.2 Other Comments

Massport is not including Alternate 1 as the preferred alternative which according to its own models provides the highest reduction in delay. Massport states that because of current conditions, peak hour pricing is not included but is an administrative option that they can later implement.

Because of the controversial nature of the peak hour pricing concept, Massport has recommended an alternative that does not include it. The selection of the preferred alternative responds solely to the current conditions and points out Massport's continued blindness to the long-term demand and capacity issues. 85.258

Alternate No. 3 provides delay reduction without the build option. Alternate No. 2 provides significant delay reduction allowing maximization of existing airfield capacity through the construction of a parallel taxiway. These two alternatives appear to be the most viable for the community. 85.259

According to 40 CFR Part 1502 Environmental Impact Statements regarding environmental consequences[32], the DEIS/DEIR must address the environmental consequences regarding the following "The discussion will include the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented. It shall include discussions of: .... (g) Urban quality, historic and cultural resources, and the design of the built environment . . ." The DEIS/DEIR discusses the preferred alternatives effect on historic districts but does not comment on the urban quality, or the design of the built environment. 85.260

Massport and the FAA state "when dealing with an existing airport (such as Logan Airport) within an urban setting (such as metropolitan Boston), any change in operating conditions aimed at more equitably distributing noise impacts (here, in accordance with the PRAS goals) may result in some increase in noise at specific historic areas while at the same time decreasing noise at other historic areas."[33]

We state that changes to Logan's operating conditions are <u>not</u> more important than the cultural, historical and urban quality of life in the metropolitan Boston community. The external costs ("costs which third parties are involuntarily forced to bear as a consequence of the undertaking of an action by others"[34]) that the preferred alternative would impose on the Logan communities are substantial. These costs have not been adequately assessed in the DEIS/DEIR. Noise impacts on historic sites are but one example that was not adequately evaluated in the draft document. The long-term prospects are for further worsening the "quality of life" situation in the community. 85.261 85.262

Alternatives to Reduce Delay at Boston Logan Airport

Background

This paper discusses several alternatives to reduce the current and forecasted aircraft delay at Boston Logan Airport. In considering alternatives for delay management and reduction at Boston Logan Airport, a multitude of options may be considered including those that are dependent on:

- airside development and expansion,
- improvements to air navigation equipment,
- intercity/corridor transport ground transportation alternatives,
- improvements in communication industry,
- using and expanding under-utilized airports,
- improvements in airspace and approach/departure management and procedures, and
- demand management policies.

Addressing the Logan delay problem has long been the subject of various analysis. While most agree that a solution for airport capacity and delay problems must be beneficial for the majority, those named parties typically include the FAA, the airlines, the airports, and the traveling public, rarely the general public, the neighbors of the airport and the communities surrounding the airport.

Some of the alternatives proposed in this report may be implemented within a short-term time period. However, most of the proposed options require significant time for development and implementation. This fact alone supports immediate action to seriously pursue these alternatives to reduce delay at Boston Logan.

Delay at an airport is caused by various reasons. The FAA groups delay causes into various categories[1] including delay due to:

* weather,
* airport capacity of the landside (ability of the terminal to accommodate the passengers, meeters, and greeters in the terminal facilities including ticket counters, gates, and baggage handling facilities),
* airport capacity of the airside (ability of the physical layout of airfield to accommodate the aircraft based on aircraft mix, wind, weather, airspace control, and operational control),
* volume of traffic compared to the ability of air traffic controller to handle it,
* closed airfield pavements including down-time for maintenance or construction,
* availability or non-performance of navigational equipment, and
* other reasons.

Adverse weather conditions are the principal uncontrollable factor intermittently reducing the achievable capacity of the airfield to a value below its theoretical physical capacity. Over-scheduling, shifting of scheduled operations from earlier periods because of prior delays or delays elsewhere, and unscheduled operations, can all result in circumstances where demand exceeds available capacity even in the absence of adverse weather. These and the other listed factors may all contribute to the gap, known as delay, created when the demand for the airport is greater than the capacity available.

The FAA has lead recent efforts in addressing the delay problem at all heavily congested airports including Boston Logan Airport. **Exhibit 1** addresses various strategies considered by FAA to reduce the delay at Logan. The summary of the recommendations was developed as part of the "1993 Boston Logan Capacity Enhancement Plan".

[1] FAA, 1993 Aviation System Capacity Plan

Exhibit 1
Summary of Recommendations
Boston Logan Capacity Enhancement Plan

Strategy: Alternative Description		Estimated Savings in Delay (000 hrs) 412,000 ops/year	450,000 ops/year	504,000 ops/year	Status
Strategy A. Separation of Small and Jet Aircraft Operation					
A-1	New commuter Rwy 14/32, undirectional	33.6	81.3	171.4	further study
A-2	New commuter Rwy 14/32, bi-directional	34.8	86.0	193.1	not recommended
A-3	Extend runway 15L/33 R to 3,500 w/ new taxiway	34.9	85.0	[illegible]	further study
A-3a	Combine alternatives A1 and A3	34.0	84.4	178.4	not recommended
A-3b	Combine alternatives A2 and A3	34.4	85.1	181.9	not recommended
A/B-4	Removal of noise restrictions on arrivals on Rwy 22R	0.222	0.255	[illegible]	not recommended
A-5	400' extension of Rwy 9 for commuters to hold short of Rwy 15R	1.8	5.6	12.9	^
A-6/D-2	Application of MLS technology with new procedures		see narrative		^
A-7	Simultaneous parallel approaches to Rwy 33L circle to Rwy 4L	1.5	0.0	0.0	^
Strategy B. Expand The Number of Rwys For Simultaneous Jet Operations					
B-1	East extension Rwy 27, hold short of Rwy 22L daylight, VFR	0.089	0.12	0.5	not recommended
B-2	Simultaneous approaches to Rwys 4R,4L, 22R & 22L < VFR 1 cond's	15.1	30.0	30.2	^
B-3	Simultaneous IFR approaches to Rwy 27, 22L 4L & 33L	2.1	4.0	4.5	^
A/B-4	Removal of noise restrictions on Rwy 4 departures	0.332	0.255	0.6	not recommended
A/B-4a	Remove noise restrictions on Rwy 4L & extension to TwyB.	0.2	0.2	0.6	not recommended
B-5	Side step approaches from Rwy 4R to Rwy 4L	1.6	0.7	0.0	further study
B-6	Utilize fan headings for aircraft departing Rwys 22L & 22R.	1.9	2.7	6.2	not recommended
B-7	Use of hold short procedures Rwys 15R, 22L 33L	3.2	8.3	17.9	^
Strategy C. Improve Taxiway Circulation					
C-1	New parallel taxiway between Rwys 4L-22R & 4R-22L		see narrative		Massport is currently pursuing a comprehensive system analysis of the taxiway system using a simulation model to improve taxiway efficiency and reduce the potential for runway incursions
C-2	New south exit parallel taxiway for Rwy 27		see narrative		
C-3	Add fillets at intersection of Twys D and C with Rwy 15R/33L	0.061	0.104	0.156	
C-4	Staging areas for Rwys 15R/33L, 27, 4R, 22R and 33L/TwyG	0.75	0.83	1.6	
C-5	New taxiway from the end of Rwy 27 to the end of Rwy 33L				
C-6	Extend TwyD to Rwy 4R/22L.		see narrative		
Strategy D. Lowering Approach Minimums

^ Will proceed toward implementation, unless otherwise noted

In the capacity enhancement plans for the most congested airports, the FAA evaluated how each individual airport could operate more efficiently for the air traveling public. The FAA did not consider nor were they asked to address the broader question that investigates how to economically, effectively, and efficiently move people from place to place.

As airports become more congested and individual airports can not keep pace with the demand, the answers to the capacity dilemma will need to consider using a full range of multi-modal transportation methods. The need to remedy the capacity problem is not being solved with the incremental addition of more airside and landside facilities. Additional construction has not and will not solve the problem.

Massport projects Logan's annual passenger demand is projected to grow from 24 million in 1993, to 29 million in 1999, and to the range of 37 to 45 million by 2010. Others[2] [3] have projected numbers in the low 30's by about 2010. Annual passenger loadings in even the mid-thirties likely exceed the effective capacity of the airfield. To address the ever-growing problem of delay by solely trying to increase airfield capacity by constructing additional pavement does not address the real issue of effectively and efficiently transporting people from place to place.

The air transport industry is a part of the overall transportation system. Solutions to reducing delays must be a part of the entire system; not just incremental construction of more runways at delayed airports. Shifting of a large portion of the airport passenger growth to other transportation modes, to under-utilized airports or to using new technology in communications is critical lest the demand chokes the existing system. This shifting is particularly relevant when the reduction is evaluated as

[2] Strategic Assessment Report, Arthur D. Little for Massachusetts Aeronautics Commission, 1993

[3] "Does New England Need Another Airport?", Dawson, Michael, L.M. Dean, and J.R. Meyer, Harvard University, August 1995

part of a total delay reduction strategy for the entire air transportation system.

It is time to consider an approach to address capacity constraints other than by solely building more runways. It should be especially noted that the airlines and passengers voluntarily schedule more flights in given periods than the airport can handle without delays, and the airport (with the federal government) allows this scheduling practice to continue.[4]

The Logan Airside Feasibility Study indicates the current level of delay at Logan is about 80,000 total hours annually.[5] Massport argues further that in 1999, with unidirectional runway 14/32 in operation, delay hours at Logan will be about 180,000 hours per year.[6] A memo prepared by Massport's consultants[7] which addresses cost of delay argues for a per-hour average cost of delay of about $3,100 per aircraft hour. Therefore, Massport's projection of the current cost of delay would seem to be about $250,000 annually, while the projection for the annual cost of delay at Logan in 1999, from Massport's figures, appears to be in the range of $550,000,000, increased slightly if 14/32 were not built.

It appears, based on these numbers, that the air transportation system is now and will be imposing

[7] Memorandum to Flavio Leo and Betty Desrosiers of Massport from David Holland of SH& E memo on May 18, 1996 referencing "Cost of Delay"

a cost each year on the Boston metro and New England area ranging from a quarter of a billion dollars (current) to over half a billion (near future) without counting the environmental, social, and other costs imposed on the area communities and residents. One might expect a significant concern with such costs. The somewhat surprising absence of a high level of complaint and of corrective actions suggests that as a whole society either does not perceive these "costs" or is inclined to accept and somehow compensate for them.

Such costs do justify major actions to control and reduce them. The actions which can be most useful in this regard are those which enhance and develop alternatives to air travel. An annual investment of a significant portion of these "delay costs" in the development and promotion of the several alternatives suggested would produce large dividends. Some of these would be appreciated in the short term while others, such as full high-speed rail service in the Northeast Corridor with ready access, major enhancements of regional airports, and replacement of many of the smaller aircraft would take much longer.

Of course, no one single entity or even a limited number of entities experiences these "costs". Seventy percent ($390 million annually for 1999) of the "costs", previously referenced by Massport's consultants, will be borne by passengers; of whom about 30 million are expected in 1999 (not all delayed). By contrast, the airline industry bears a much smaller share, projected to amount to around $ 150 million annually in 1999.

A part of the problem, therefore is how to support the costs of developing and implementing alternatives. Options might include additional "airport ticketing fees" levied on passengers, assessments against aircraft operators (in the form of increased and dedicated user fees), the proceeds of "congestion fees", and general or special levies not directly linked to the air transport system.

Another part is how to allocate such funds among the several alternative modes of communication and transport which could serve to ameliorate the delay situation. A third part is the control of the funds and their expenditures. By contrast, decisions concerning responsibility for collecting such funds are simple.

Massport is currently pursuing several options identified in the FAA's Boston Logan Capacity Enhancement Plan in the airside improvements planning project (including construction of a new commuter and jet uni-directional runway 14/32, a centerfield taxiway, other taxiway improvements, and administrative techniques). However, a review of the summary list from the Boston Logan Capacity Enhancement Plan may provide some insight into additional actions that may be considered by Massport in the future.

A real-life example of FAA acting on the airport delay problem is the history of the high density rule (HDR). About 28 years ago, FAA established restrictions on operations during peak hours at some of the nation's most congested airports. While this paper does not advocate the introduction of "slots" for Boston Logan, this historical action does point out that airport capacity constraints can result in substantial political actions besides construction and expansion. A brief history of the HDR and a summary of a comprehensive review of this rule will provide some insight to the concerns over airport capacity and delay.

High Density Rule[8]

In 1968, the FAA established a regulation to address delay problems at five of the nation's busiest airports. The regulation, known as the High Density Rule (HDR) implemented in 1969 governed the

[8] Information on HDR Rule summarized from "A Report to Congress - A Study of the High Density Rule", USDOT, May 1995.

allocation of capacity at Chicago O'Hare, Washington National, New York area's: Kennedy, LaGuardia, and Newark airports (Newark was later exempted from the rule).

The HDR allocates capacity at these four airports by imposing limits on the number of operations during certain periods of the day. A single operation, commonly called a "slot," is authorized by the Department of Transportation under the FAA for air carrier, commuter, and other types of operations.

In 1968, rising flight demand, work slow-downs between FAA management and air traffic controllers, over-scheduling by the airlines, limited airport capacity and unlimited access by general aviation led to a determination by the air carriers, air travelers and the federal government that a short-term solution was needed to reduce congestion, thus the high density rule was implemented.

For each airport, the rule imposes limitations or quotas on the number of slots allocated per hour (or half hour) for three classes of users: Air carriers, scheduled air taxis (regional carriers and commuters), and other operators (general aviation, charter operators, military, and other nonscheduled operators).

After nearly 25 years in operation, a long term capacity solution was still not in-sight and the HDR rule was still in effect at these four airports. The rule has evolved to change with the aviation industry environment as a result of the introduction of wide-body and jumbo jets, airline deregulation, airline mergers and acquisitions, bilateral agreements, growth in international service, airline hubbing, and FAA flow control management.

In 1993, the National Commission to Ensure a Strong Competitive Airline Industry urged a review of the HDR rule and gave consideration of lifting the operational restrictions. The Report to

Congress on "A Study of the High Density Rule" as a response to the Industry Commission reported[9]:

* Changing the HDR will not affect air safety
* While each of the four HDR airports has unique characteristics, eliminating or substantially changing the HDR is likely to result in an increase in the number of airport operations. These increased operations will carry both benefits and costs, including:
  * Benefits to consumers in the form of new and expanded air services and reduction in air fares,
  * Increase in revenue for each airport as a result of a larger number of operations,
  * A reduction in airline profits when fare premium presently charged at 3 of 4 HDR airports is lost due to increased competition,
  * An increase in travel delay time and costs -- for consumers and airlines -- due to increased "peaking" of demand in airport operations as users opt to fly at their most desired times, and
  * A near-term increase in the size of the population affected by aircraft noises at each airport.

The report also noted that "if lifting the HDR precipitates significant travel delays, consumers, airlines, and the airports will be motivated to adjust their behavior in response to market forces, as happens at non-HDR airports across the U.S. Consumers, for instance, might elect to fly during "off-peak" hours, and airlines could modify their flight schedules to mitigate increased delay costs."

Relevant to Boston Logan is the discussion in the cited report on peaking, or as in the case of the HDR, changes in peaking. It was noted "increased peaking has important potential consequences for noise impacts, delays and economic benefits. If more operations are concentrated into shorter periods of time, perceived noise, and therefore noise impacts, increase.

Similarly, delays may be exacerbated by the concentration of operations in shorter time periods. At any given time an airport's capacity to process traffic on its airfield is fixed, depending on weather

[9] Excerpts from Executive Summary of "Report to the Congress: A Study of The High Density Rule", USDOT, May 1996

conditions and runway configurations. A higher concentration of operations is likely to cause longer queues of both arrivals and departures."

One important reason that change to the rule was considered is the advances made in air traffic management. The FAA's traffic management system has changed dramatically since 1969 when the slot rule was implemented. Traffic management innovation and sophisticated technology equipment has enhanced the efficiency of the air space system.

The above cited comprehensive report on the High Density Rule, released by the U.S. Department of Transportation, concluded that the projected costs to consumers, airlines and communities of eliminating or modifying the rule currently outweigh the benefits, and that it would not be in the public interest to initiate a rulemaking on this issue.

In this paper, a brief summary of some alternatives to more and more construction at Logan are introduced. Some of these concepts are an out-growth of a simple idea but complex to put into practice. The solutions require action on a local regional, and national basis so political support will need to be garnered to effectively solve the delay dilemma.

Airside Development and Expansion

Since the concerns of expanding the airfield to squeeze what additional capacity there is left on the physical facility by constructing more pavement for landing, departing and taxiing aircraft is being pursued by Massport, this report will not address the alternatives of expanding the Logan airside to gain additional capacity. The current Massport proposals, were they to be allowed and implemented, represent the maximum feasible significant expansion of airfield pavement at Logan.

There are significant obstacles to these proposed improvements including legal obstacles, environmental issues and the disapproval of citizens of communities in the Greater Boston area which are already impacted by noise, air pollution, and construction activities at Logan.

Instead of building additional pavement, Massport needs to explore other options that might relieve existing and future airport delay at Logan. These larger scale issues may require action from various agencies going across state lines and focusing regionally or even nationally to find a solution that looks at the larger problem of airport congestion.

Improvements to Air Navigation and Equipment

The FAA is currently working on several programs to enhance air traffic control, air navigation, and weather information that may be able to reduce future airport and airway congestion and delay. There are several types of emerging technologies that should help pilots navigate and land during low or reduced visibilities.[10]

An Enhanced-Vision System (EVS) uses different types of sensing methods like forward-looking infrared and millimeter wave radar to allow the pilot to view the approach and objects that could be obscured due to weather or darkness such as hill, towers, or other objects which could be a hazard to air navigation. Synthetic-Vision System (SVS) is enhanced EVS using information included in a data base regarding the terrain and runway. SVS information would be displayed "in front" of the pilot through the use of a head-up display.

[10] J. Glen Moore cited by CRS Report for Congress: Airport Congestion: Background and Some Policy Options, Stephen J. Thompson, May 20, 1994

A head-up display (HUD) of an enhanced-vision system (EVS) or synthetic vision system (SVS) is a tool being developed that allows the pilot to see the runway better through a pull-down piece of equipment located in front of the pilot. The HUD allows the pilot to view the approaching runway in natural light without the need to move his head or adjust his vision from far-sight to short-sight to observe the EVS or SVS display.

While certainly adding to safety considerations during any IFR approach procedure, these emerging technologies may be able to ultimately provide reduced minimums for certain approach configurations; thus allowing additional operations to occur in poor weather conditions than are presently feasible. These improvements may have a significant impact on reducing weather-related delays.

The Global Positioning System (GPS) now jointly operated by the U.S. Department of Defense and the U.S. Department of Transportation is highly likely to make precision instrument approaches available to many runway ends where no physical obstacles exist. It is the FAA's intention to provide new approaches using GPS instead of the traditional Instrument Landing System (ILS) presently in wide use.

The cost of GPS equipment supplemented by some ground equipment is significantly less than ILS. The data received from this system of earth-stationary and earth-orbiting satellites would allow pilots to determine the latitude, longitude, and altitude of their aircraft to precision level standards.

Already GPS is widely being used as a non-precision approach at air carrier and general aviation airports. FAA is currently testing its usage for precision instrument capabilities. The FAA is hopeful that GPS can increase airport capacity because it will allow for the implementation of additional instrument approaches, giving air traffic controllers more options to route traffic into the airport.

One cautionary note regarding the advent and usage of GPS is the shifting of the operational patterns which may occur because of the greater airfield operational flexibility. *Massport is urged to coordinate implementation of new GPS approaches with the community so that noise, frequency of operations, odor, and other concerns of the community can be carefully considered in the choice of runway approaches and runway priorities.*

Intercity/Corridor Transport Ground Transportation Alternatives

Providing alternatives to air transportation by focusing on improvements in ground transportation including rail and transit systems could reduce the need for new airport capacity. If ground transportation options were more convenient and competitive for traditional air travelers, these transportation modes could present a viable alternative to congested airports for travel in corridors where these modes are available.

Setting regional and national policies to promote better ground transportation alternatives and new technologies such as high speed rail, magnetically levitated trains, and other related technologies must be a priority to reduce airport congestion. In a congressional research service report it was noted that "Public policies regarding ground transportation alternatives, and related emerging technologies, might be able to significantly reduce future airport congestion and delays, at least in some corridors such as Boston to Washington, D.C.".[11]

According to the FAA's 1993 Aviation System Capacity Plan, nine of the 33 airports anticipated by to be "congested" by 2000 (exceeding over 20,000 hours of delay) lie along the Atlantic Seaboard between Washington, D.C. and Boston. These airports include the following:

[11] Congressional Research Service, The Library of Congress, "Airport Congestion: Background and Some Policy Options", Stephen J. Thompson, May 20, 1994

- BDL Windsor Locks, CT
- BOS Boston, MA
- BWI Baltimore Washington, MD
- DCA Washington National, VA
- EWR Newark, NJ
- IAD Washington Dulles, VA
- JFK New York John F. Kennedy, NY
- LGA New York LaGuardia, NY
- PHL Philadelphia, PA

The ability to provide alternate modes of transportation rather than air travel will be crucial to the entire eastern coast. The currently-programmed improvements (electrification) to the railroad corridor between New York City and Boston should provide an increase in service frequency and a reduction in rail time travel to about three hours, city to city. Better railroad travel time and increased frequency should lead to a shift to rail transportation between these two cities. The Harvard University paper previously cited projects a shift from air to rail of about one million passengers annually in 2010, about three percent of projected demand at that time. Others who have studied the issue are in general agreement with this estimate.

Unfortunately, further significant improvements, such as "mag-lev" trains operating in the 150-200 mile per hour range on new rights of way could cost as much as $20 to $ 30 million per track mile, plus rolling stock. In addition, significant right of way and environmental obstacles would have to be surmounted.

As an example of airport revenues being used to fund alternative transportation sources: New York's Governor George Pataki has recently outlined a plan that will eventually link J. F. Kennedy Airport to Pennsylvania Station in downtown New York. The Kennedy/Penn rail link would be funded as part of the "Master Links Transportation Plan" using $ 750 million in passenger facility charge

revenues, with the balance coming from the Port Authority of New York and New Jersey's capital funds.[12]

It is recognized that alternatives to develop ground transportation modes is a national as well as regional issue. *It is recommended that Massport actively pursue regional development of rail and bus capacity and capability for the purposes of relieving future airport delay through enhanced Northeast Corridor surface transport, as well as enhanced surface transport to and from Logan. Massport should support and contribute funding for these efforts.*

Improvements in Communications Industry

Developing technologies including video conferencing, world-wide-web communications and other emerging communications industry improvements may indeed influence future air transportation for business travelers. While the impacts of these communications enhancements are currently difficult to quantify, the improvements could change the way of doing business, saving costs and expenses while providing economies in resources. This may facilitate a dramatic change in the way our society does business and travels to meet business needs. For example, satellite inter-active telecasts are now a regular feature of the information transfer programs of major professional groups.

As airport delay increases, many business people may find it more effective to use these emerging techniques rather than to travel by air. This may be especially true of business travelers on one to two day trips. The air transportation industry, though hardly currently threatened by this communications technology, may find that this alternative may impact future travel forecasts.

[12] As cited in Airports, 1996 The McGraw-Hill Companies, May 7, 1996, page 180

Educating the business travelers to allow them to experience this new technology would provide a future resource to choose this option over air travel, reducing demand for limited airport capacity. It is not practical at this time to estimate the extent to which growth in demand for air travel might thereby be reduced.

Massport should expose business travelers to the potential of these emerging technologies. These efforts should be cooperative with leading providers of electronic communications technology, with business groups and professional associations, and with universities. In addition to supporting marketing efforts, Massport should participate in the development of facilities and the enhancement of technologies. In both cases it should encourage participation by Airports Council International and similar groups.

Using and Expanding Under-Utilized Airports

Another alternative is to provide an air transportation system that allows further utilization of currently available New England region airports, instead of increasing the capacity of Logan.

However, it was noted in a report prepared for Massport entitled Air Service Patterns in New England[13] that "unless there are significant changes in demand patterns, capacity, or ground access times at Logan, the regional airports are not expected to attract significant levels of traffic away from Logan within the immediate future." This report points out that over 70% of the total operations at Boston, Bradley, Providence, Portland, Manchester, Hyannis, Nantucket, and Worcester airports were recorded at the seven smaller airports. However, these seven regional airports account for only

[13] LOGIC - "Air Service Patterns in New England", prepared for the Massachusetts Port Authority by Flight Transportation Associates, Inc. subconsultant to Frederick R. Harris, Inc., February 8, 1993, page 41

30% of the enplanements. Thus, Logan accommodated 70% of the enplaned passengers with only 30% of the operations. The report recognized two types of regional airports, including:

- Type A — those who have established air carrier services parallel to Logan, and
- Type B — those that serve primarily as commuter feeders to Logan.

The report indicates that the "larger regional airports experience sufficient demand to provide origin-destination services for their respective market areas. Although some destinations can only be reached through connections at Logan or other major cities." Further, "The role of Boston or New York as a hub has become less significant for those regional airports which have attracted sufficient demand to establish services beyond the most important markets." **This suggests that as the regional airports develop more mature markets and additional air service the demand for hubbing activities at Logan may be reduced.**

In order to decrease delays at Logan, it will be necessary for more Type B airports who are commuter feeders to Logan to provide "stand-alone" air service from their own regional facility. In addition, the larger regional, Type A airports must expand their market base to reduce their connection requirements with Logan. Expansion of these regional airports is an on-going process, and much has been or is being done. Airside, landside, and terminal construction will be an important element in allowing these facilities to become poised to expand their air service. The Air Service Patterns in New England Study indicated that all the regional airports could accommodate "very significant expansions in passenger handling capability" and many of the airports have already completed terminal expansion projects. However, that report further stated airside expansions including new runways would be difficult to accomplish due to environmental constraints.

This cited report suggests that because of the continued congestion surrounding Logan, both from an airport delay standpoint and a ground access problem, that passengers will voluntarily choose other alternative airports for service. It was recognized though, that these regional airports have a tough time competing with Logan for frequency, international activity, and market competitiveness for fare prices.

Since many agree that help for delay increases at Logan can come from the further development of the regional airports and establishing a market base for these under utilized airports, the key to the solution will be to identify what specifically can be done to set up additional air services at these regional airports.

An Air Passenger Service Study on New England's Regional Airports[14] identified that "each of the regional airports has some service underdevelopment and could viably support additional jet service". It was noted that of the eight regional study airports analyzed, Portland, Manchester, Worcester and Providence are the most impacted by Logan in terms of service area traffic using another airport. Hartford and New Haven were identified as being related to the New York airports in terms of traffic diversion. Burlington and Bangor airport service areas were identified as autonomous.

From the noted passenger survey, the fare survey at the regional airports noted that the air fares are generally higher at the regional airports relative to Boston or New York although not in all markets. The most significant differences in fares tended to be in the shorter haul business travel markets to New York, Washington and Philadelphia. Nonstop flights at the regional airports generally have higher fares than connecting services.

[14] New England Regional Airports Air Passenger Service Study, Phase I Summary Report, prepared by New England Council, Hoyle, Tanner Associates, Kramer Associates, SH&E, Inc, November, 1995.

If profitability to the airlines is the only factor that will establish convenience to passengers and minimize Logan's demand, it will be necessary to look toward ways to attract service, provide incentive packages, and make deals with the carriers to establish the service that will serve the overall public interest not just the airlines.

The cited passenger survey recommended a strategy of identifying opportunities for fare parity to local carriers and demonstrating that fare reductions will be offset by increased revenues. It was noted that because "regional carriers have fewer seats to sell, the chances of obtaining fare parity are enhanced where there is the most jet service".

All agree that there is no simple solution to change the way airlines do business. However, the idea that the passenger will eventually re-shape the scheduling of the airlines does not appear to be a viable approach, either for the short or long time-frame. The distribution of traffic between the regional airports and Logan has remained fairly constant. Thus, the pressure from market forces has not induced any substantial changes in the way the regional air service market in New England is operating.

One specific need which has been identified is to substantially improve ground access to the Worcester airport, to overcome one of the major impediments to its marketing and use. This should be a responsibility of the Massachusetts Highway Department. Reconsideration of the role of Hanscom Field has also been urged, coupled with an enhanced ground link between Hanscom and Logan. A joint effort of Massport and the Massachusetts Executive Office of Environmental Affairs would be needed.

It is time to take some measures to induce those changes. It is recommended that Massport step-up their existing activities to promote the development of the other New England Airports. Massport's

participation in the New England Council Study is a beginning which has provided marketing assistance and technical services to specific regional airports. Follow-on efforts to marketing regional airports to air carriers, and to research and analyze traffic leakage should be fully supported by Massport. More aggressive tactics are needed to actively induce additional services to the regional airports. *Massport, together with the other regional airports, should make regional airport market service expansion a priority.*

There are financial constraints on the airports whose "logical service areas" abut Logan's. There are impediments to Massport providing significant assistance to facilities in which it has no "stake". Therefore, it is recommended that Massport pursue the acquisition of partial interest in those airports with the greatest potential to provide alternative service to Logan, with the view of a) making Massport resources available to those airports and b) diversifying Massport's interests.

Improvements in Airspace and Approach/Departure Management and Procedures

A goal of the FAA's traffic management function is to ensure that the number of aircraft in the air to any location and in any airspace does not exceed the personnel or equipment capability to handle these aircraft. To ensure attainment of that goal, the FAA will hold aircraft on the ground, and assign a departure time that limits the demand to a manageable number of aircraft at the destination airport. This "ground delay program" is a keystone of the modern traffic management system.

For a given set of operating conditions (wind, weather, runway configuration) with operational limits, the ground delay programs define specific departure times for flights to match the demand to the available capacity at an airport, or in a sector of enroute or terminal airspace.

There are three types of ground delay programs currently in use: Select (selected flights, individual time assignment), general (fifteen minute block delay factors), and a combination of select and general. Other programs that are currently available to assist in the management of delay from an airspace perspective and to ensure operational safety include:

* Preferred Routes
* National Route Program
* Managed Arrival Reservoir
* Limited Airborne Holding
* Special Event Programs
* Airport Reservation Office
* Sector Traffic Management Program
* Severe Weather Management
* Severe Weather Avoidance Plan
* Departure Flow Management
* En Route Flow Management
* En Route Spacing Program
* Miles-in-Trail and Altitude Restriction
* Arrival Flow Management
* Arrival Sequence Program
* Enhanced Traffic Management System
* Terminal Air Traffic Control Automation
* Airport Surface Traffic Automation
* Terminal Doppler Weather Radar
* Wind Shear Warning Systems
* Collision Avoidance Systems
* Precision Runway Monitoring System
* Global Positioning System

These improvements to the traffic management system have favorably affected delay at congested airports. Other programs to enhance Air Traffic Control facilities, programs, and processes will be a further step in making the air traffic system run as efficiently as possible - a key link in the transportation system.

An issue at Logan is whether the FAA can and will be proactive in concert with Massport to further reduce delay; moving beyond its apparent support of the airfield improvements project. For example, might the FAA expand and enhance its implementation of selected elements of the above measures to influence the scheduling practices of air carriers?

Additionally, it is recommended that Massport enhance electronic navigational aid in the following ways:

* Provide precision instrument equipment (GPS or CAT II ILS) on Runway 33L
* Implement Parallel/LDA Point in Space Approaches to Runway 4L
* Install the following systems as developed:
  - ◊ Wake Vortex Avoidance System
  - ◊ Vortex Advisory System
  - ◊ Global Positioning System on all candidate runways
  - ◊ Precision Runway Monitoring Radar System

With the full electronic navigational aid upgrades, an Enhanced Preferential Runway Advisory System can be developed that will reduce delay at Boston Logan Airport while also reducing impacts.

Massport, in conjunction with the FAA, should implement new traffic management systems that work with the goals of the community to reduce noise and congestion. In addition, work should continue to quantify the benefits that improvements in airspace, approach and departure management and procedures can have in reducing delays at Logan.

Demand Management Policies

The establishment of congestion fees, or peak-period pricing, in which such fees would charged for use during peak hours would have the objective of shifting some aircraft operations to other times of the day or week, thereby lessening the number of operations during the peak. Using peak period pricing to improve the airport's capacity during periods on congestion and delay is favored as a tool by many economists.[15]

A goal of charging additional fees at Logan during peak hours is to induce a shift in the aircraft operations during the existing peak time period to less congested hours of the day and days of the week. The result would be to reduce the delay during peak-hour operations.

Another goal of congestion fee pricing would be to encourage the airlines to expand services at other under-utilized airports. Could the peak-hour pricing revenue to be used to promote airline expansions into these other market areas?

An example of a demand management policy is an action of the Port Authority of New York and New Jersey which operates LaGuardia, John F. Kennedy, and Newark Airports. In 1968, the Port Authority raised the minimum landing fee for aircraft during peak hours by a factor of 5, while keeping the off-peak fee the same. Peak-hour surcharges produced significant beneficial results at all three of these airports.

---

[15] "It may be possible to say with considerable confidence that use of the facility with a congestion toll, although not globally optimal, would be more efficient than use without the toll." In Alan Carlin and R.E. Park, "Marginal Cost Pricing of Airport Runway Capacity", American Economic Review, Vol. 60, June 1970, pp. 310-319, at p. 310 as cited from CRS Report for Congress, Airport Congestion: Background and Some Policy Options, Stephen J. Thompson, May 20, 1994

The Port Authority's congestion fee was challenged in a court suit, and was up-held by the court as follows:

> "The United States District Court found in favor of the Port Authority, ruling that the defendants were justified in distinguishing different classes of aircraft on the grounds of safety and efficient use of landing facilities. The court further recognized that the fee was meant to induce aircraft operator to use other times of the day or other facilities."[16]

The Port Authority continues the policy of using peak hour pricing at all three of the metropolitan New York airports although the peak-hour fees have not substantially changed since their initial implementation. The result of the low price fee surcharge limits the effectiveness for significantly shifting operations during the peak period.

In 1988, Massport instituted a management pricing program at Logan entitled PACE which based its landing fees both on the weight and the operations of the aircraft where previously the landing fees were based (as is traditional) only on weight. The PACE program succeeded in reducing the number of smaller planes by this pricing program. Logan increased its on-time performance record during this period.

[16] U.S. Congress, Congressional Budget Office, Paying for Highways, Airways and Waterways: How Can Users be Charged?, Report Number ISBN 0-16-03797-7, May 1992, Washington, D.C. U. S. Government Printing Office, 75 p., at p.24 as cited by CRS Report for Congress: Airport Congestion: Background and Some Policy Options, Stephen J. Thompson, May 20, 1994

The U.S. Department of Transportation disallowed this program[17], citing the PACE program as discriminatory pricing since it did not differentiate between congestion and non-congestion periods and the allocation of cost between weight and operations was found to be arbitrary.[18] (It is noted that Massport plans the release of a study of the impacts of the PACE program for mid-summer 1996).

Because Logan has such frequent commuter services acting as a New England hub for both code-sharing regional affiliates (typically a smaller airline which agrees to share similar functions like reservations, frequent flyer programs, gates, etc. with larger, name-recognized airlines) and smaller, independent airlines, the number of passengers on these aircraft are small but their frequency is high.

As noted in one report[19] noted "More than 60 percent of regional flights at Logan are in aircraft with 19 or fewer seats. Logan also has the highest overall percentage on non-jet aircraft operations at more than 50 percent and the smallest average aircraft size among major U.S. airports".

This same report from the Transportation Research Board concluded that certain factors must be present for a peak period pricing program to offer tangible benefits at an airport. These include:

* Regularly occurring, measurable congestion,
* No external regulatory scheme that reduces market forces (i.e. slots),
* Peak-period fleet mix sensitive to small fee changes,
* Quantity of air service is available so as not to eliminate access to a particular community.

---

[17] The Boston Sunday Globe, "Small planes a big factor in airport congestion", Charles M. Sennott, April 14, 1996

[18] Peak Hour Pricing at Logan Airport, Massachusetts Port Authority, April 1993

[19] Transportation Research Board Record 1461, Peak Pricing As It Might Apply to Boston-Logan International Airport, Claire Barrett, Richard J. Murphy, Scott Lewis, Mark Drazen, Lynn Pearson, Amedeo R. Odoni, and William Hoffman

The TRB Report modelled the impact of a revised fee structure and resultant cancellations and flight shifts, predicting a reduction in delay hours at Logan and significant benefits. The effect on the air carriers shown in this model indicated that the three major code-sharing airlines (Delta, Northwest, and USAir) would be most affected by cancellations of flights.

It was noted that "although these three major regional airline systems would be affected, they and their code-sharing jet partners (and their passengers) also would be among the primary beneficiaries of the reduced congestion and delays at Logan". Obviously, one of the key goals of a demand management policy would be to encourage regional flights with fewer passengers to re-schedule activities in non-peak hours; thus, spreading out the use of the airfield to accommodate the demand and minimize the delay.

Still another goal for a demand management policy would be to encourage the use of larger aircraft carrying more people while using relatively the same operational time on the airfield. Eliminating or consolidating flights to provide higher load factors would maximize airline revenue, reduce operations, and provide for delay reduction. Scheduling for flights and selection of aircraft size has traditionally been market driven. It is time to introduce other economic factors into the decision matrix.

The public interest is a key concern in trying to get the greatest benefits with the existing system. Maximizing net benefits consistent with public interest considerations is particularly important at congested facilities, since access must be limited in the interest of providing efficient operations. In domestic markets, flights using large jet aircraft tend to produce greater benefits than commuter or general aviation flights with smaller prop aircraft.[20] Therefore, it makes sense to look at management

[20] "Report to the Congress: A Study of The High Density Rule", USDOT, May 1995, Chapter 7, Sub-Section: Reallocate Slot Pools Among User Groups, Page 111

techniques that will encourage usage of larger aircraft at Logan. Assisting the airlines in scheduling to maximize load factors in a manner which did not materially affect their competitive position, would not only be profitable for the airlines but would also reduce delay.

Congestion pricing, peak-period pricing and techniques which base landing fees on functional categories relating to operations (landing or take-offs, weight (or size) of aircraft, and capacity to meet peak period demand will be particularly useful in reducing delays.

The models which have been previously performed on peak period pricing scenarios have shown that this management technique can produce tangible benefits in reduction of delays. This type of management technique allows for better utilization of the airfield over time while encouraging additional development of under-utilized airports. It has advantages of negligible initial capital costs for all participants, of flexibility and specificity in design, in phasing-in to allow optimum "adjustment" periods for affected carriers, and in the ability to be readily revised as conditions warrant.

A properly-designed and implemented form of congestion pricing, among the alternatives under consideration, will afford the greatest degree of delay reduction at Logan, for a given investment; and overall has the greatest potential for benefit. It must be recognized, however, that the operations profile at Logan is comparatively rather flat, and thus the extent to which flights can be rescheduled from peak hours to non-peak hours in response to fee changes is limited. The greatest benefit will likely come from consolidation of flights, thus increasing load factors.

Obviously Massport has previously experienced some regulatory and political challenges in implementing a demand management technique. Peak period pricing is currently being evaluated as an alternative in the Environmental Impact Statement and Environmental Impact Report being prepared for the Logan Airside Improvement Planning Project.

Consideration should also be given to a quite different approach to addressing the efficiency of Logan Airport during peak operating periods and in carrying out its primary mission. In a simplistic form, the mission of the airport might be defined as "the accommodation of as many passengers as feasible under existing conditions with a minimum of delay" with some stated commitments to minimizing impacts of operations.

The measure of efficiency presently used by Massport and the FAA relate to numbers of aircraft operations handled in specific periods (i.e. per hour); and the hours of delay experienced in handling those operations. Massport's efforts have focused on operational and facility expansion approaches to increase the capacity for total aircraft operations under restrictive conditions (i.e., when use of Runway 15/33 is required, or when visibility is restricted).

However, if the aircraft passenger is identified as the "unit of concern" in the airport's primary mission, the fundamental measure of efficiency and the principal objective of the airport would be to maximize the number of passengers transiting the airfield per hour. If maximizing the throughput of passengers were the dominant objective of the management and operation of the airport facilities under the control of Massport, the measures considered might differ from the current proposals. Massport is already expanding the capacity and improving the efficiency of access roads, parking garages, and terminals, with the principal measure being the number of passengers able to be accommodated in an interval of time.

One approach might be to use the hourly integral of aircraft type/seat capacity adjusted by the current or projected average load factor for each aircraft type and operator or route. To maximize facility efficiency and to provide the maximum feasible throughput of passengers during critical periods, Massport could through defined mechanisms encourage or give preference to the use of its facilities under its control (i.e. gates, hold rooms, terminals) during critical periods by aircraft and operators

providing service to the greatest number of passengers. Massport would apply this approach through lease terms and operating agreements with its lessees and aircraft operators.

At some point in the future, Massport, the FAA, and other transportation officials will have to make a decision about mass public air transportation. If it is decided that "the good of the many outweigh the good of the few" for the use of limited physical facilities, then management techniques could be implemented that encourage larger aircraft users and higher load factors. It is noted that the effects of these techniques may well have a larger impact on the regional carriers and lower load factor routes. In addition, an increase in the disturbance to neighbors to Logan may be effected since these techniques encourage use by larger aircraft.

Massport is encouraged to develop congestion pricing, peak-period pricing and other delay management programs encouraging increases in load factors, more even distributions of operations throughout the day and expansion of airline services at regional airports. Evaluation of specific strategies to manage demand should evaluate the impact of the various fees established for the peak period pricing technique. Modelling should include a variety of price scenarios to determine the relationship between spreading demand to non-peak hours as well as shifting demand to other airports.

Concluding Comments

Efficient management of the existing airport facility, improvements to air navigation equipment and airspace control, uses of all modes of transportation to transport people where they want to go, increased use of existing under-utilized airports by increased air service and frequency, and providing aggressive measures to manage the demand at the airport are all alternatives that will reduce the current and forecasted aircraft delay at Boston Logan Airport.

It is recognized that combinations of these alternatives will be necessary to address the growing delay concerns at Logan. Too much time has been spent trying to solve the problem by constructing more pavement. It is recommended that Massport focus substantial efforts (as are other airports) on implementing some of these alternatives to reduce delay at Boston Logan Airport.

Specifically, Massport should establish some goals for shifting the demand at Logan by using or implementing other alternatives than airfield expansion. Some suggestions to consider would include:

1. Establishing goals to gradually shift future demand at Logan to other transportation modes, other airports, or communications techniques over a set time period including 5, 10, 15, and 20 year goals. This type of master planning technique will focus attention on shifting demand to other avenues and will allow for a concentrated effort to recognize the growing delay concern.

2. For each alternative, specifically target activities that Massport can develop that support each of the goals. Establish time-frames in which these activities can be accomplished. Identify obstacles including economic, political, and policies issues that may retard progress for each alternative. Develop a strategy to overcome those obstacles.

3. Implement demand management policies that will augment the goals established. Document their effectiveness and expand these polices to induce a shift in demand for Logan.

4. Measure and monitor the effectiveness of delay reduction for each alternative. Encourage exploration of other alternatives as they develop over time.

It is recommended that Massport, the Department of Transportation, the Massachusetts Executive Office of Transportation and Construction, and the airline industry step further away from their traditional roles and responsibilities, and attempt to minimize the interference of self-interest, in order to cooperatively develop coordinated recommendations to senior legislative and executive bodies and commitments to funding and implementations. Otherwise, the future holds only increasing impacts, frustration, and costs; with the concomitant development of greater and opposing pressures for action.

Memorandum by David Standley, P.E.

dated March 27, 1996

on Logan Odor Issue

regarding "Analysis of Odor Complaints at Logan Airport"

prepared by KM Chng Report, March 1996

DAVID STANDLEY, P.E.
Consultant in Environmental Management

MEMORANDUM

To: Bernice Mader, Chair, MPA Logan Community Advisory Committee
Subj: Logan odor issue
Ref: "Analysis of Odor Complaints at Logan Airport", KM Chng Report, March 1996
Date: March 27, 1996

I have reviewed the subject report, prepared by KMC for Massport (through Vanesse Hangen Brustlin Inc.), and have asked Myleen Leary to provide additional copies for you and the other members of the Consultant Team. KMC analyzed Massport odor complaint data for the years 1991-1994, and has produced a very interesting document. The purpose of this memo is to highlight the KMC findings and discuss the implications for the CAC review and response to the Airside Improvements Project.

Sources of Odors:
KMC reports that jet engine idling and low power taxiing are the operating conditions during which the greatest concentration of potentially odorous compounds are emitted, the cause being inefficient combustion. KMC also suggests that high-thrust operations (i.e., start of take-off roll) may produce significant amounts of odorous compounds even though combustion is relatively efficient, because large quantities of fuel are consumed. All of these operations are, of course, conducted at ground level. KMC also reports that considerable variation in discharge of odorous compounds occurs among aircraft and aircraft engines, attributable to differences in engine design and maintenance.

I agree with these conclusions. While a close look at the KMC data might suggest some odor impact of overflights, I feel the data is too limited to support any speculation in that regard.

Period of Review and Sources of Data:
The review period of the KMC study was the years 1991 through 1994. The source of complaint data was the records of the Massport Noise Complaint Line (which generate Aircraft Disturbance Reports). Meteorological data was obtained from both the National Weather Service and the Massport ADRs. Runway use configurations associated with complaints were obtained from the ADRs. Other operational data was provided by Flight Transportation Associates.

Factors Causally Associated with Complaints:
KMC statistically analyzed the association between a number of factors which might be causally associated with the complaints received, and the complaint history. While a number

of factors were associated in time with specific complaints, the ones which appeared to be causal and explain the largest percentage of complaints were, in order of importance,

- Ambient temperature—61-80° F
- Time of Day—7-10 a.m., 4-9 p.m.
- Critical wind direction/runway use combinations for the downwind location of interest

The "Ambient temperature" range is suggested by KMC to represent conditions maximizing outdoor activity and open windows.
"Time of Day" appears to be a metric which both substitutes for and incorporates airfield activity and community activity, resulting in maximum exposure potential. Probably the most important activity factor is queuing of aircraft on taxiways (explicitly recognized by the community-FAA "agreement" to limit queuing of jets on TW November to five planes).
These first two factors account for a majority of all complaints registered.
The third factor accounts for the largest single group of complaints in a given neighborhood, as would be expected.

I was somewhat surprised at the outset to read that wind speed, atmospheric stability and turbulence did not appear to be significant. On reflection, I would attribute that to the fact that the NWS measurements of those factors are "gross" and likely rather different from the conditions which exist at ground level at the ends of operating runways; where pavement and water temperatures, and aircraft activity, may establish local conditions not measured by the available instrumentation.

Number of Complaints:
During the period considered by KMC, Massport received a total of 272 odor complaints through its Noise Complaint Line. (These are distinguished from those complaints which were about noise, but also mentioned odor as a source of irritation.) This is an average of slightly more than one complaint per week! I would consider this to be a rather low response rate to an odor source, in the absence of other factors. KMC further isolates the combinations of conditions likely to create odors in the neighborhoods around Logan, and finds such conditions occurring during about 10% of the total hours analyzed. Treating each complaint as an "incident" representative of one hour, KMC derives an overall "incidence frequency" of about 8%. In other words, during only about 8% of the time during which one might expect complaints were complaints actually registered through the Noise Complaint Line. KMC attempts to analyze the factors which might affect the response rate, and does so competently. Principal factors suggested by KMC as potentially influencing the "complaint rate" include physical factors (i.e., micro-meteorology) which would preclude significant concentrations of odorant in the presence of the analyzed factors predisposing to complaint; as well as factors affecting the predilection of residents to phone the Complaint Line.

My observation is that these numbers are not consistent with the stress placed on odor concerns by residents of the communities immediately adjacent to Logan, both over the years in my experience and during the current ARC/CAC process. This requires discussion among the participants.

My concern is that Massport may interpret these numbers as indicative of a "*de minimus*" problem

Neighborhoods Principally Affected by Odors:
KMC found that three neighborhoods were the principal origin of the complaints received during the four-year study period. These are Court Road in Winthrop (86), "Orient Heights" in East Boston (which I assume includes the Bayswater Street area) (71), and Pleasant Street in Winthrop (40). All other areas registered less than 20 complaints each over the study period, with Eagle Hill, Jeffries Point, Harborview (all East Boston), and "Upper Winthrop" each registering in the 10-20 complaint range.

I am surprised that the Jeffries Point and Eagle Hill areas seem not to be heavily impacted by odors generated by aircraft activity in the immediate vicinity of the terminals. Otherwise, I think the findings, in terms of the areas most affected by odors from aircraft engine emissions, are consistent with logic and past representations by community representatives.

Odor Response and Potential for Reduction of Odor Impacts:
KMC correctly observes that human response to odor stimulus is non-linear; in fact it is logarithmic. That is, the relationship between the perceived odor intensity, "I", and the concentration of odorant, "C", is expressed as $I = k (C)^n$ where k is a constant and n is an exponent, both of varying magnitude but always positive. This yields a straight-line plot on log-log paper, with **k** establishing the intercept on the y-axis and **n** the slope of the line. (**n** is normally less than unity). Under the case where n = 0.7 (the uppermost of its usual range), a reduction of the concentration by a factor of ten would change perceived odor intensity by a factor of about 5; in other words, the result is only about half the effort. Were **n** = 0.2 (the lower end of its usual range), the same reduction of the concentration by a factor of 10 would change the perceived odor intensity by only about 1/3; in other words, the result is less than 5% of the effort. Typically, a change in odorant concentration must exceed about 20% to be generally detected as a change.

A conclusion to be drawn from the above is that major reductions in source strength (aircraft engine emissions of odorous compounds in specific locations) will be required to effect perceptible improvement in odor impacts. Conversely, changes in aircraft operating procedures and locations, as proposed in the Airside Improvements Project, should not be expected to result in significant improvement.

Of much greater potential odor impact is the projected increase in aircraft operations at Logan over time. Without significant reduction in the rate and change in the nature of jet engine emissions, a 25% increase in operations would have two impacts readily detectable as increases in odors in the community. First, the concentration of odorous compounds would increase during those time periods when operations increased by such a percentage; and second, the time periods of intensive aircraft operations would be significantly extended

to accommodate the increase in operations (since the airfield is at or near capacity during peak hours now).

Summary and Conclusions:

KMC stresses that the problem of odor impacts on residents of the adjacent communities must be considered real and significant. I feel that the data supplied by Massport likely under-represents the scope and intensity of odor impacts because of a general tendency of the (relatively stable) population of the communities to (a) become disillusioned about the value of complaints, (b) utilize other methods and fora to express their concerns, and (c) to become somewhat desensitized or inured to this odor stimulus. It is impossible to judge whether different and more representative data might result from a different method of determining either or both community response or odor concentrations in the neighborhoods. However, I suggest Massport consider a trial implementation of a focused odor complaint survey project in one of the most impacted areas, over the coming summer season.

Conversely, again, were a significant change in operating procedures or locations to expose a new population to jet engine odors, there would likely be a substantial increase in the number of complaints registered. The construction of RW 14/32, and its use by jet aircraft for a takeoff in the 14 direction, would result in a start-of-roll point moving about 2500 feet closer to Jeffries Point compared to takeoffs on RW 9. Jeffries Point would be downwind of such operations on a southeasterly wind. The effect of construction of the Centerfield Taxiway on odors in the Court Road and Pleasant St. areas of Winthrop would be similar in manner but not in magnitude. The distance between these areas and the Centerfield TW would be about 2-3000 feet, compared to 3-4000 feet from TW November. These areas are and will continue to be impacted by operations involving RW 4R/22L, which is about 1000 feet from the backyards of houses on Court Road.

The identification of the more impacted areas is consistent with other information, and intuitively correct; despite the relatively small number of registered complaints.

The potential odor impact changes which may be associated with the current Airfield Improvement Project are overshadowed by the potential odor impact changes associated with the growth of Logan operations, and the shift of commuter traffic from propeller to jet propulsion.

Consultant to the CAC

Appendix C

Draft Proposal for Discussion

prepared by David Standley, P.E.

dated May 24, 1996

on "Efficiency of Utilization of Facilities during Peak Hours"

MASSPORT LOGAN COMMUNITY ADVISORY COMMITTEE
LOGAN AIRSIDE IMPROVEMENTS PROJECT

EFFICIENCY OF UTILIZATION OF FACILIITIES DURING PEAK PERIODS

A DRAFT PROPOSAL FOR DISCUSSION

May 24, 1996

The Consultant Team to the Logan CAC suggests consideration be given to addressing the **efficiency of Logan Airport** during peak operating periods, in carrying out its primary mission. We understand that mission to be the accommodation of as many **passengers** as feasible under the extant conditions with a minimum of delay. (There are, of course, modifiers to this mission expressed as commitments to minimizing impacts of operations; but discussion of those constraints is not the purpose of this paper.)

Heretofore, the metrics of efficiency utilized by Massport and the FAA relate to numbers of **aircraft operations handled** in specific periods (i.e., per hour); and the **hours of delay** experienced in handling those operations. Their efforts have focused on operational and facility expansion approaches to increase the capacity for total aircraft operations under restrictive conditions (i.e., when use of Runway 15/33 is required, or when visibility is restricted).

We propose that the **aircraft passenger** is the "unit of concern" and the *raison d'etre* of the airport (with a bow to transport of parcels, not critical to this discussion). This, we believe, is also the fundamental concern of Massport, although it has not so expressed it to our knowledge. The expansions and modifications underway and proposed by Massport its for terminals, garages, and other landside facilities, and the investments therein, are testimony in support of that assumption. It follows, therefore, that maximizing the throughput of **passengers** should be the **dominant objective** of the management and operation of the airport facilities under the control of Massport.

Thus, we further propose the fundamental measure of efficiency and of attainment of the principal objective of the airport, be the **number of passengers transiting the airfield per hour.** The total would be derived as the sum of all passengers arriving at and departing from all gate and apron positions within the hour of concern. It is unnecessary and probably

impractical to measure the comparable throughput of landside facilities (access roads, garages terminals). In any event (as noted) Massport is expanding the capacity and improving the efficiency of those facilities, **with a principal measure being the number of passengers able to be accommodated in an interval of time.**

As a prospective planning and management tool, a surrogate for the measurement of the number of actual passengers transiting the airfield per interval must be established, of course. Our proposal is the hourly integral of aircraft type/seat capacity adjusted by the current or projected average load factor for each aircraft type and operator or route.

Massport would apply this approach, **the minimizing of costs to the user community**, to its management of the facilities under its control terminals, hold rooms, gates, and aprons through lease terms and operating agreements with its lessees and aircraft operators. To maximize facility efficiency, to provide maximum feasible throughput of passengers during critical periods, and thereby attain this objective, Massport would through those mechanisms encourage or give preference to the use of its facilities during critical periods by aircraft and operators providing service to the greatest number of passengers. A form of agreement for use of facilities is anticipated which would not cede full control at all times over a specific portion of Massport's property to a specific operator.

The effect would be observed in the scheduling of operations by the aircraft operators and owners using Logan in response to the incentives and strictures that Massport elected to institute. No actions or decisions by the FAA or DOT would be required. The effects would not be immediate in most cases, since current lease terms would be respected for as long as mandatory; but on the other hand, they do not need to be.

Letter 85
Community Advisory Committee
Anastasia Lyman, Co-Chair

Code	Topic 1	Topic 2	Comment	Response
85.1	Environmental Review Process	MEPA, FAA/NEPA	Massport for too long has been allowed to take a segmented approach to Logan's development, arguing that landside projects are designed to accommodate ground passenger handling; airside improvement projects are designed to accommodate aircraft handling; that neither generates traffic; and that Massport has no control over passenger and cargo growth.	The purpose of the Airside Improvements Planning Project is to reduce current and projected levels of airfield congestion and delay and to enhance the safety of aircraft operations at Logan. Massport's proposed landside improvements are planned to enhance the efficiency of passenger processing, and include terminal modernization, as well as roadway, parking and service area improvements. The landside projects will not affect the design or implementation of the Airside Project, which has independent utility, nor will the Airside Project improvements affect the design or implementation of any of the landside projects. All airside and landside projects, where required, will continue to be the subject of separate comprehensive environmental analysis by project proponents in accordance with federal and state regulations. As expressed in the May 7, 1999 EOEA Certificate, Massport's Environmental Planning and Status Report (ESPR, formerly GEIR) process "is expected provide a big picture cumulative impact analysis of Logan operations, impacts and mitigation. It complements the project-specific EIRs," such as this one for the Airside Improvements, "helps to focus the review process of individual EIRs, and ensures that segmented project review does not occur in the context of MEPA review at Logan Airport."
85.2	Purpose and Need	Delays	The Airside Improvement Planning Program is a short-range and limited response to a major concern about long-term trends, future growth, and increasing impact.	The Airside Project will provide immediate delay reduction benefits to Logan Airport users, and the delay savings will grow over time as passenger traffic increases. Although Massport only has jurisdiction over Logan Airport and Hanscom Field, and now operates Worcester Regional Airport, the agency has for years taken a leading role in supporting regional transportation initiatives and the development of alternate modes. In fact, since 1996, eight out of ten new air passengers in New England have used the regional airports rather than Logan Airport. Massport's support for regional transportation initiatives, its proposed PPP monitoring program, and the Preferred Alternative are part of Massport's long-term strategy for reducing delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
85.3	Analysis Assumptions/ Methodologies	Forecasts	Base year should be 1998 and planning period should extend to 2020.	Consistent with the request made by EOEA in its Certificate, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. However, it should be noted that the appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project, is a comparison of the Preferred Alternative to the No Action Alternative. A discussion of current and historic conditions can be found in Section 4.2 of the Supplemental DEIS/FEIR. Current traffic trends at Logan Airport and the regional airports indicate that Logan Airport is not expected to reach the 29 million passenger forecast presented in the Airside Project Draft EIS/EIR until 2003. Continued air service expansion at the regional airports and the introduction of high-speed rail to New York in December 2000 is expected to further slow Logan Airport's passenger traffic growth. With these developments, Logan Airport is not expected to achieve the 37.5 million passenger forecasts until 2015, and the 45 million passenger forecasts will not be achieved until 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period of at least 20 years. Refer to Section 4.2 of the Supplemental DEIS/FEIR for a complete discussion of the planning forecasts.
85.4	Delay	Model	The FAA data on delays show that the delay situation at Logan has improved since 1993 and is essentially in equilibrium, as assessed by the FAA.	Section 1.4 and Appendix C of the Supplemental DEIS/FEIR contains a discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport with other United States airports. The delay situation is not at equilibrium. FAA Opsnet delays at Logan Airport peaked in 1993, declined for two years and are rising again. Arrival delays, which would be directly affected by Runway 14/32, have risen steadily since 1994. In fact, Logan Airport is the second most delayed airport in the nation for arrivals.
85.5	Analysis Assumptions/ Methodologies	Base Year	The Airside delay model (DELAYSIM) used hourly weather observations from 1981 to 1990. Weather patterns have changed significantly within the last five years due to effects from El Niño and La Niña. A new 10-year average should be constructed and used.	Comparative analysis of 1981 to 1990 weather with 1989 to 1998 weather identifies no significant differences in statistical properties.
85.6	Regional Transportation	Cargo	Item not specifically addressed in the DEIS/DEIR: Discussion of diversion to cargo to off-airport alternatives.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Secretary of Environmental Affairs' Certificate on the ENF directed Massport to "discuss [these] off-airport alternatives and analyze the potential each has to divert passengers and/or cargo from ... Logan Airport." Cargo operations were not specifically analyzed because they account for only two percent of aircraft activity at Logan Airport and since most all cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
85.7	Regional Transportation	Regional Airports	Item not specifically addressed in the DEIS/DEIR: Considering the off-airport alternatives as a separate scenario.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The alternative analysis conforms to FAA and MEPA scoping directives. The impact of the regional alternatives has been addressed through the study of a range of forecast activity levels. Refer to Chapter 2 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR for a comprehensive discussion of regional alternatives.
85.8	Regional Transportation	Regional Airports	Item not specifically addressed in the DEIS/DEIR: Failure to consider Hanscom Field in Bedford as a reliever airport for general aviation operations, origin/destination regional non-jet traffic, and short-haul origin/destination jet traffic.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR, specifically considered the role of Hanscom Field in the analysis of regional alternatives. Hanscom Field, which serves as a general aviation reliever airport to Logan Airport, already accommodates a significant number of aircraft operations (183,000 operations in 1998). The Hanscom Field activity includes private, business, charter, and air taxi operations that might otherwise use Logan Airport. Since the Airside Project Draft EIS/EIR was filed, Shuttle America, a newly founded airline, began commercial scheduled operations at Hanscom Field, offering limited turboprop services to short-haul regional markets – Trenton, Buffalo, Hartford (discontinued), Wilmington, Delaware (discontinued), and Greensboro. Shuttle America is also conducting operations between Hanscom and New York LaGuardia Airport. While Massport supports commercial service at Hanscom Field consistent with its established limits (60 seat regulation), Massport believes that Hanscom Field will maintain its role as a major general aviation reliever, and that its geographic proximity to Logan, Worcester Regional and Manchester airports will prevent its development as a significant commercial airport. Additionally, commuter airlines serving Logan Airport are unlikely to move a significant number of flights from Logan Airport to Hanscom Field, since approximately 50 percent of passengers on Logan Airport's commuter flights connect to other Logan Airport flights and a significant number of passengers are travelling to Boston. However, any new commercial service initiatives proposed for Hanscom Field shall be reviewed for consistency with the *Hanscom GEIR* (HGEIR) and its Annual Updates, and shall be considered by the Hanscom Area Town Selectmen (HATS). Refer to Section 2.6 of the Supplemental DEIS/FEIR for a discussion of Hanscom Field.
85.9	Regional Transportation	Regional Airports	Item not specifically addressed in the DEIS/DEIR: Considering the development of a second major airport, in discussion of environmental justice.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. Because the development of a second major airport would require ten to 15 years for site selection and environmental review in addition to a multi-year construction period, this option is not viewed as a solution to accommodating forecast demand over the next 20 years. Service developments at other surrounding airports, including Manchester, T.F. Green/Providence and Worcester Regional airports, preclude the need for a second major airport.

Code	Topic 1	Topic 2	Comment	Response
85.10	Delay	Model	Item not specifically addressed in the DEIS/DEIR: Detailing of the existing delay at Logan including delay derived directly from wind/weather and indirectly from delay at other airports.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The Airside Project addresses delays from constraints at Logan Airport. Section 1.4 and Appendix C of the Supplemental DEIS/FEIR also contains a detailed discussion of the FAA and U.S. DOT delay measures and historical data, along with comparisons of Logan Airport delays within the context of delays at other United States airports.
85.11	Noise	PRAS	Item not specifically addressed in the DEIS/DEIR: Documentation of history of PRAS and problems implementing it.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. Section 4.3 of the Supplemental DEIS/FEIR contains a history of PRAS development and performance at Logan Airport.
85.12	Environmental Review Process	MEPA	The Secretary of Environmental Affairs should determine that significant planning deficiencies exist in the DEIS/DEIR that must be addressed. The DEIS/DEIR should be found inadequate, and a new Draft document should be required.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act...". Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999.
85.13	Delay	Model	The proposed projects provide only limited and interim relief to whatever aircraft operating delays at Logan Airport are caused by or as a result of the airfield configuration. The delay problem as modeled and represented by Massport will get worse.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 hours under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate and long-term benefits by lowering runway delays by 38,000 hours if it had been in place in 1998, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. Because of the impact of the regional alternatives, the 37.5M High Fleet scenario is not expected to be achieved until 2015. The sooner airside efficiencies are implemented; the more benefits will accrue over time. Section 4.6 of the Supplemental DEIS/FEIR shows that delay reduction benefits increase over time as traffic levels increase.

Code	Topic 1	Topic 2	Comment	Response
85.14	Regional Transportation	Regional Airports	There is no plan or program to deal with long-term growth at Logan. There are measures that could be instituted to effectively address transportation in eastern New England, but there is no discussion in this document. There must be a plan and a program to shift some current, and most growth in, air traffic and passengers away from Logan. Major expansion of service and capacity of other airports must be undertaken.	Massport continuously engages in planning for Logan Airport through the GEIR process (now called the *Logan Airport 1999 Environmental Planning and Status Report, ESPR*). The 1994/95 GEIR, subsequent Annual Updates including the 1999 ESPR, the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR all recognize the role that Logan Airport plays in the larger regional transportation context and acknowledge inter-city travel alternatives to Logan Airport. Furthermore, Massport and the FAA have taken the lead in promoting the development of regional airports as an alternative to Logan Airport. In 1995, the FAA and Massport co-sponsored the New England Regional Airports Air Service Study, which estimated the number of passengers that bypassed regional airports in favor of Logan Airport and recommended strategies for increasing regional airport air service levels and their attractiveness. FAA is sponsoring an upcoming New England Regional Airports System Study. Since 1996, there has been tremendous growth at the regional airports. In fact, eight out of ten new air travelers in New England have chosen the regional airports over Logan Airport. The regional airports are expected to accommodate an increasing share of the overall growth in air travel demand within the greater Boston area. This will provide some relief to Logan Airport. Nevertheless, the proposed Airside Project is necessary and provides clear benefits at current traffic levels. These benefits will only increase in the future, even as developments at the regional airports act to reduce the rate of future growth at Logan Airport. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a discussion of growth at the regional airports, including capital improvements and traffic growth.
85.15	Noise	Fleet Mix	Massport should evaluate increase in "equivalent jet operations."	Refer to Appendix C of the Supplemental DEIS/FEIR for equivalent jet operations by project alternative.
85.16	Alternatives	Runway 14/32	Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan directly, because of delay reduction.	Implementation of the elements of the recommended Airside Project, specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. This capacity is available at Logan Airport approximately 80 percent of the time. Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used at Logan Airport. The runway will substantially reduce the delays that now occur during northwest wind conditions. Preventing these delays will represent a real benefit to the passengers and airlines that currently experience them. However, because these wind conditions and the associated delays are not regular or predictable, and cannot be readily anticipated, it is not expected that their prevention will stimulate growth in Logan Airport passenger demand above and beyond the rates that would have occurred without the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. Refer to the discussion in Section 4.2 in the Supplemental DEIS/FEIR.

Code	Topic 1	Topic 2	Comment	Response
85.17	Alternatives	Demand	This project and landside projects at Logan are interdependent, and both will increase capacity and stimulate demand.	The Airside Project has independent utility from existing and proposed landside projects at Logan Airport. The proposed Airside Projects at Logan Airport are designed to improve airport efficiency and better accommodate current and future levels of demand. Long-term growth in air travel demand is a recognized worldwide phenomenon that results from economic and demographic growth. Massport has no control over the underlying determinants of aviation growth. The construction of unidirectional Runway 14/32 would prevent the significant drop in airfield capacity that now occurs during northwest wind conditions. The runway will not increase Logan Airport's normal operating capacity of approximately 120 operations per hour which is available nearly 80 percent of the year. The runway does not induce or stimulate new traffic that would otherwise not occur at Logan Airport.
85.18	Ground Transportation	Access to Logan Airport	Massport's proposal to increase the percentage of passengers accessing Logan Airport who do so in high-occupancy vehicles falls far short of absorbing the full projected increase in passenger ground access requirements.	The *Logan Airport 1999 ESPR* (previously GEIR) which was filed December 15, 2000, examines the feasibility of reaching a higher target percentage for air passenger HOV ridership than 35.2 percent when annual air passengers reach 37.5 million.
85.19	Alternatives	Runway 14/32	There can be no guarantee of "unidirectional use" of Runway 14/32.	The Runway 14/32 concept under review in the Supplemental DEIS/FEIR allows unidirectional operations only - i.e., all aircraft arrivals would occur over Boston Harbor to the Runway 32 approach and all departures would initiate from Runway 14 heading out over Boston Harbor. State approval under MEPA and federal approval under NEPA will allow Runway 14/32 to proceed only on a basis consistent with the stated unidirectional limitations. Consistent with any such approvals, Massport will light and stripe Runway 14/32 to accommodate unidirectional operations only. Appropriate supporting documentation will also be issued (e.g., appropriate designations in the Airport/Facility Directory, and Notices to Airmen or NOTAMS). Furthermore, the location of proposed Runway 14/32 involves physical limitations that reinforce the unidirectional requirements of that improvement concept. The Hyatt Hotel and Conference Center, which is 174 feet high, is within 1,300 feet of Runway 14. The location of the Hyatt Conference Center invades applicable FAA approach surface glide slope requirements, thereby precluding arrivals from the west to the Runway 14. Another factor limiting westerly operations on Runway 14/32 is the lack of available facilities to allow aircraft to taxi to Runway 32. The unidirectional limitations of Runway 14/32 allow for maximum use of over-water operations which would thereby limit operational impacts over residential areas. To reinforce these important environmental benefits, Massport has designated the intended unidirectional limitation on Runway 14/32 as a mitigation measure. It is anticipated that any state and federal approvals will also strictly reinforce the unidirectional limitations intended for Runway 14/32.

Code	Topic 1	Topic 2	Comment	Response
85.20	Noise	PRAS	... airfield operations are unlikely to attain, and even less likely to sustain, the progress toward attainment of PRAS goals that Massport projects.	During very high demand periods, the controllers have little or no flexibility for runway selection and PRAS recommends an appropriate runway configuration given the extant demand. Unidirectional Runway 14/32 would give the controllers considerably more flexibility and allow them to improve achievement of PRAS goals. The Supplemental DEIS/FEIR demonstrates that the controllers have been improving performance with respect to PRAS recommendations. Section 8.5 of the Supplemental DEIS/FEIR contains methods for more comprehensive monitoring of PRAS. These methods will be implemented as part of the mitigation program for the Airside Project.
85.21	Noise	PRAS	PRAS goals may well no longer represent community consensus.	The PRAS goals were established after community input in the 1980s. The goal of PRAS was to distribute noise equitably, based on demographic considerations. As demonstrated in the Supplemental DEIS/FEIR, there have been no significant demographic changes since the time of the establishment of the PRAS goals. An update of the PRAS goals is therefore not warranted. Furthermore, the Supplemental DEIS/FEIR also demonstrates the more equitable balance of noise impacts among communities surrounding Logan Airport that can be achieved with the Preferred Alternative as opposed to the imbalance that occurs today and would occur in the future if no action is taken.
85.22	Noise	Fleet Mix	Most of the projected increases in passenger demand will be met by increased operations of the "passenger jet" fleet. This of course is the fleet that creates the noise impacts at Logan and elsewhere.	The operations forecast accounted for passenger growth and how that growth would be accommodated within a range of future fleets. The noise analysis reflects the impacts associated with these fleets. Refer to Chapter 6 of the Supplemental DEIS/FEIR.
85.23	Noise	Runway Use, PRAS	There will be significant increases in overflights of East Boston, Chelsea, Everett and other "15/33" communities, and of South Boston, South End, Roxbury and other Runway 27 communities.	The Supplemental DEIS/FEIR projects that the Preferred Alternative would promote runway use in a manner that is more consistent with annual PRAS goals. The total number of departures from Runway 27 (over South Boston, Roxbury, and Jamaica Plain) would increase, but the number of equivalent jet operations would remain essentially the same. The difference in these communities would be fewer nighttime operations and more daytime operations but the same noise impacts. Total departures from Runway 33L and arrivals to Runway 15R (over East Boston and Chelsea) would increase, but most of these are non-jets. These runway operations are currently running well below the PRAS goals, and the unidirectional Runway 14/32 would allow the controllers to approach, but still remain below the annual goals for these operations. Additionally, by increasing the number of operations over water, Runway 14/32 would reduce the total annual hours of dwell and persistence over populated areas in accordance with short-term PRAS goals.
85.24	Noise	Hushkitted Aircraft	Massport overstates the benefit of further conversion to Stage 3 aircraft on future noise levels around Logan Airport.	The study does not overstate the benefit of further conversion to Stage 3 aircraft on future noise levels. It uses two fleet scenarios in which almost all aircraft meet Stage 3 requirements, either as hushkitted Stage 2 aircraft or new Stage 3 aircraft, and three fleet scenarios in which all the aircraft meet Stage 3 requirements. Most of the aircraft are new high-bypass, engine-powered Stage 3 aircraft. Many of the hushkitted aircraft have been retired.

Code	Topic 1	Topic 2	Comment	Response
85.25	Noise	Nighttime Noise	The number of nighttime jet operations can be expected to double within the foreseeable future under conservative forecasts. The noise impacts of this increase are huge, and are not mitigated by use of Stage 3 aircraft since night operations are now required to be only of that type.	Table 6.2-17 of the Supplemental DEIS/FEIR shows nighttime jet operations projected to increase from 106 in 1998, to as many as 259 under the No Action Alternative with the 2015 High Regional Jet Fleet. However, regardless of the fleet, many of the future night operations are the result of delays that will occur as demand at Logan Airport continues to increase. One of the direct benefits of the Preferred Alternative is that it will reduce these night operations by 32 to 43 flights depending on the fleet forecast, though *any* alternative to the No-Action scenario will help alleviate some of the projected delays. In addition, Massport is committed to exploring other measures to reduce nighttime noise whether or not the Preferred Alternative is implemented.
85.26	Noise	Nighttime Noise	An alternative that should be considered is the creation of a cap on nighttime operations pursuant to FAR Part 161.	Since a low level of flight operations occurs during nighttime hours, very few delays occur during these hours. Therefore, eliminating night flights would not be a viable alternative as a delay reduction measure.
85.27	Noise	Runway Use	A significant number of flights did not conform to the published departure tracks, and re-crossed the shoreline over Hull and were also below 6,000 feet.	Comment noted.
85.28	Noise	Sound Insulation	We disagree with the statement, "After sound-proofing to mitigate impacts within the 65 DNL Contour, the full-build alternatives provide net long-term benefits."	Long-term benefits are derived from reduced delays, increased achievement of PRAS goals, and the reduced numbers of people exposed to the highest noise exposure levels. Each of these benefits becomes more substantial as aircraft operations are projected to increase over time. Refer to, for example, the comparison of exposed populations presented in Table 6.2-3 of the Supplemental DEIS/FEIR. Sound insulation reduces noise inside the home. While the implementation of the Preferred Alternative would bring additional homes within the criteria for inclusion in the sound insulation program, the inside of these homes will have lower noise levels than they would have had without sound insulation under the No Action Alternative.
85.29	Noise	Sound Insulation	Concerns about Massport's residential "soundproofing" program include the pace of the program, the failure to provide air conditioning in conjunction with the "soundproofing" program, and the small number of dwelling units that are eligible for the program.	By the end of the 2000 construction season, Massport sound insulated approximately 3,400 residential buildings containing about 6,000 dwelling units, constituting one of the largest sound insulation programs in the country. Construction over the last seven years has proceeded at the rate of 550 to 800 dwelling units per year. Mitigation of noise impacts from the Preferred Alternative is estimated to add up to 1,450 units to the program. At current construction rates, that work could be complete in approximately two years. FAA policy regarding sound insulation programs requires that "positive air ventilation" be provided in conjunction with sound insulation treatment so that windows may be left closed during all seasons to maintain adequate noise reduction. The Massport residential sound insulation program is designed to comply with this requirement.
85.30	Noise	Sound Insulation	FAA Order 5100.38A makes ineligible for AIP funding any non-related code-required building improvements necessary to accommodate acoustic treatment improvements. This may impose significant burdens on some property owners.	Federal requirements typically exclude the FAA from any responsibility to bring a building up to code when the structure is sub-standard but otherwise qualifies to participate in an airport-sponsored sound insulation program. However, to address impacts in particular projects such as the proposed Airside Project, FAA has discretion to use grant funds to bring buildings up to code as part of this mitigation program to the extent such improvements are required to proceed with the sound insulation work. The mitigation program for the Airside Project includes use of grant funds for such purposes.

Code	Topic 1	Topic 2	Comment	Response
85.31	Air Quality	Odor	The proposed Airside Improvement Project provides minimal long-term air quality benefits. Changes in air quality associated with the proposed project are likely to be undetectable, with the exception of adverse odor impacts. There is potential for adverse odor impacts in certain areas proximate to the airport, as a result of this project. Changes in odor impacts are most likely to occur in the Jeffries Point neighborhood from takeoffs on Runway 14.	The Airside Project leads to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. However, decreases in odorous emission concentrations will be imperceptible.
85.32	Air Quality	Odor	The odor modeling and odor impact assessment procedure is inadequate.	Neither the EPA nor the FAA provides specific requirements, guidelines, or standards for assessing odors at airports. The modeling of odor-causing hydrocarbons was used as a surrogate in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. The results are used as an indicator of odor-causing compounds.
85.33	Air Quality	Impacts	For all modeled contaminants other than VOCs, the difference (if any) among Airside Improvement Project alternatives is much less significant than the projected growth of emissions over time.	The growth in emissions over time will occur with or without the Airside Project. However, the Preferred Alternative presents a significant decrease in emissions compared to the No Action Alternative.
85.34	Air Quality	Model	Massport should have used the ten-year hourly average meteorological input for the air quality dispersion model, and should be required to rerun to dispersion model for all of the conditions modeled for the DEIS/DEIR.	In accordance with EPA, MDEP, and FAA modeling guidance, DELAYSIM uses ten years of weather data, not an average of ten years of data. These data were obtained from the National Climatic Data Center. Also, the air quality dispersion model that was used complies with EPA and FAA standards.
85.35	Ecosystems	Rare Species	A program is required to compensate for impacts to the nesting habitat on Logan Airport of the state-listed endangered upland sandpiper. The suggested program appears highly speculative as described. Massport should be required to set forth the resolution with NHESP in the DEIS/DEIR.	Massport has developed a comprehensive on-site and off-site Upland Sandpiper habitat mitigation plan in close coordination with the Massachusetts Natural Heritage and Endangered Species Program (NHESP) for loss of such habitat at Logan Airport associated with construction of the Centerfield Taxiway. The plan strives to enhance protection of remaining Upland Sandpiper habitat at Logan Airport without increasing the aviation safety hazards typically associated with birds or hazards to the birds. Additionally, it is expected that an area of former Upland Sandpiper habitat at Camp Edwards on Cape Cod will be restored to grassland habitat by removing woody and shrub vegetation to encourage enhancement of the Upland Sandpiper regional population. This restoration effort provides a unique opportunity to expand grasslands in the Commonwealth far in excess of the 40± acres to be lost at Logan Airport. A Memorandum of Agreement will be signed between Massport and the Massachusetts Army Air National Guard for implementation of the program.
85.36	Construction	Mitigation	Massport has failed to demonstrate how fugitive dust emissions from construction operations on the airfield will be controlled during winter months.	Construction-period air quality impact mitigation will include the steps specified in FAA Advisory Circular 150/5370-10A, Standards for Specifying Construction of Airports. These and other measures are listed in Section 8.5.2 of the Supplemental DEIS/FEIR.
85.37	Construction	Noise	Shortcomings of the Massport construction noise analysis include its failure to address the matter of pure tones and of impact noise (i.e., paving breakers and hoe rams), and the failure to separate out and separately analyze nighttime construction noise levels against nighttime ambient levels. The noise criteria applied by Massachusetts Department of Environmental Protection are applicable to this project.	The analysis of nighttime construction noise levels does not show any significant impact from construction noise, since no pure tone noise is allowed to be emitted from construction equipment such as back-up alarms, as specified in Massport's construction mitigation guidelines.
85.38	Noise	Sound Insulation	We disagree with the statement, "After sound-proofing to mitigate impacts within the 65 DNL Contour, the full-build alternatives provide net long-term benefits."	Refer to response to Comment 85.28.
85.39	Environmental Review Process	FAA/NEPA	Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan.	Refer to responses to Comments 85.1, 85.16 and 85.17.

Code	Topic 1	Topic 2	Comment	Response
85.40	Analysis Assumptions	Forecasts	The planning period is inadequate, and should be extended to 2020. There is no plan or program to deal with long-term growth at Logan, which will soon overwhelm any interim benefits of this project.	Massport has developed a range of potential future traffic levels for planning purposes. For a variety of reasons, Massport believes that the forecasts described as 1999 and 2010 projections in the *Logan Airside Improvements Feasibility Study, Phase I Report and the DEIS/EIR* will not be achieved until after 1999 and 2010, respectively. The Airport is likely to reach 29 million passengers (formerly the "1999" forecast) in 2003. Developments at the regional airports and Amtrak's high speed Acela Express rail service to New York are expected to further slow Logan Airport's passenger traffic growth. As a result, Logan Airport is now expected to reach 37.5 million passengers in 2015 and 45 million passengers in 2024. Thus the planning forecasts that underlie the delays and environmental analyses cover a planning period that extends beyond 2020. Refer to Chapters 1 and 4 of the Supplemental Draft EIS/Final EIR for a complete discussion of the planning forecasts.
85.41	Purpose and Need	Delays	Delay does not appear to be a major problem at Logan, based on Massport's two-year history of inaction and on FAA analyses.	Refer to response to Comment 85.4.
85.42	Environmental Review Process	MEPA	The DEIS/DEIR should be found inadequate ...	Refer to response to Comment 85.12.
85.43	Analysis Assumptions	Forecasts	The airside project and the landside projects at Logan are interdependent, and both will increase capacity and stimulate demand.	Refer to responses to Comments 85.1, 85.16 and 85.17.
85.44	Delay	Model	Background information on the development of these models [FLAPS and DELAYSIM] is not presented, as required by FAA.	FLAPS and DELAYSIM have been discussed in Section 4.4 of the Supplemental DEIS/FEIR. These models were originally developed for Logan Airport under Massport and FAA funding, and have been used in airport planning studies in the United States and internationally.
85.45	Delay	Model	Massport did not use the FAA-approved SIMMOD model for the airport simulations, but chose to develop its own model for estimating delay.	The Supplemental DEIS/FEIR contains a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of computer models for estimating flight delays, including their limitations. SIMMOD is not well suited for conducting the long-term delays analysis that DELAYSIM provides for the Airside Project study. FAA reviewed and approved the simulation models used in this study.

Code	Topic 1	Topic 2	Comment	Response
85.46	Delay	Model	The delay hours projected by Massport are the artifacts of its own model, severely overstate the actual situation, and do not comport with the FAA's procedure for calculating delay at airports.	Refer to Section 4.4 of the Supplemental DEIS/FEIR for a discussion on the estimation and modeling of flight delays. Chapter 1 and Appendix C include a description of FAA and U.S. DOT delay measures and their limitations, an explanation of computer models for estimating flight delays, and historical data on delays at Logan Airport and other major United States airports. The methodology used for the Airside Project includes the effects of constraints at Logan Airport, and produces lower delay estimates than FAA modeling. The FAA approved all the models, which have been validated in previously published studies of Logan Airport. The FAA Technical Center was responsible for the capacity and delay results in the 1992 FAA Capacity Enhancement Report for Logan Airport that concluded the need for Runway 14/32, reduced minimums and taxiway improvements. The Technical Center simulated Logan Airport airfield operations with the RDSIM model and estimated that when activity reached 504,000 annual operations, total delay would exceed 260,000 hours per year. The Airside Project Draft EIS/EIR forecasts delays to increase to 157,500 hours per year when annual operations reach 510,000 with the 29M Low Fleet scenario. The Supplemental DEIS/FEIR compares the FAA Technical Center delay estimates in 1992 with those of the Logan Airside Project estimates. The FAA has concluded that the Airside delays represent "a plausible and conservative estimate...." The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States Logan Airport's estimated annual delay hours are over five times the FAA's 20,000-hour threshold for a severely delayed airport.
85.47	Noise	PRAS	The DELAYSIM model should use as the leading criteria the highest capacity configuration and air traffic controller workload weighting approved by FAA ATC.	The FAA has signed a MOU with Massport to follow PRAS recommendations, when feasible. Implementing a maximum capacity policy would ignore the agreement for equitable distribution of noise among the surrounding communities, and cause use of the northeast-southwest runways to grow to 70 percent or higher. The workload weighting factor used in DELAYISM was developed in conjunction with FAA ATC.
85.48	Delay	Model	The report compares Massport's calculation of delay with FAA's calculation of delay. This comparison throughout the DEIS/DEIR is incorrect and misleading.	Refer to response to Comment 85.46.
85.49	Delay	Model	The FAA data on delays cited elsewhere in this report shows that the delay situation at Logan has improved since 1993 and is essentially in equilibrium ... The DEIS/DEIR does not reflect this information.	Refer to response to Comment 85.4.

Code	Topic 1	Topic 2	Comment	Response
85.50	Delay	Model	Modeled delay under the most optimistic Massport scenario will return to present levels within a very few years and increase after that. The stimulation of demand is not reflected in the annual hours of delay calculations.	Based on simulation modeling, Logan Airport experienced 120,000 hours of runway-related delays in 1998. If no actions are taken, runway-related delays are forecast to grow as high as 333,000 under a 37.5M High Fleet scenario. The Preferred Alternative produces immediate *and long-term* benefits by lowering runway delays by 38,000 hours under 1998 conditions, and by as much as 94,000 hours in the future 37.5M High Fleet scenario. The sooner airside efficiencies are implemented, the more benefits will accrue over time. The Preferred Alternative, and specifically unidirectional Runway 14/32, would not increase Logan Airport's normal airfield capacity of approximately 120 operations per hour. Instead, Runway 14/32 would allow Logan Airport to maintain this capacity during periods of strong northwest winds that now require controllers to operate on only one or two runways, compared to the typical three-runway configurations used during high demand periods. The runway will not increase Logan Airport's normal operating capacity, nor will it encourage or induce an increase in aircraft operations. The runway will substantially reduce delays that occur during northwest wind conditions, and will represent a real benefit to the passengers and airlines that currently experience them. However, these wind conditions and the associated delays are not predictable and cannot be anticipated, so Runway 14/32 will not stimulate growth in Logan Airport passenger demand above the rates that would have occurred absent the runway. Instead, growth in Logan Airport passenger demand will be principally driven by local and national economic conditions, competition and pricing within the airline industry, and the distribution of airline services and passenger traffic between Logan Airport and the surrounding regional airports. The broad range of forecasts considered in the airside operational and environmental analyses would capture any potential variation in future passenger and aircraft activity at Logan Airport.
85.51	Alternatives	Runway 14/32	While peak hour capacity does not increase with construction of the runway, the additional runway will provide the controllers the option to use higher-capacity configuration more of the time. This ability is providing additional "throughput" of aircraft operations.	Runway 14/32 would correct an airfield deficiency in the northwest operating direction by increasing the capacity of that configuration closer to the airport's normal operating capacity of 120 operations per hour.
85.52	Environmental Review Process	FAA/NEPA	Massport has not met the requirements of the National Environmental Policy Act ... No discussion of "alternatives not considered in this DEIS/DEIR" was included.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to FAA scoping directives, applicable FAA environmental orders and all other NEPA requirements.
85.53	Regional Transportation	Regional Airports	DEIS/DEIR should include development of a new airport.	Refer to response to Comment 85.9.

Code	Topic 1	Topic 2	Comment	Response
85.54	Alternatives	Other Non Construction Alternatives	DEIS/DEIR should include Consideration of Implementing a High-Density Rule (Slots)	Neither federal nor state scoping directives required an analysis of slotting. Imposition of slot controls constitutes a federal policy that has been preempted to the FAA under federal law and is not within Massport's jurisdiction. Congress determined that the slot program has a number of significant problems. The U.S. DOT has studied options for reducing slot controls at airports. As a result, the AIR-21 Act, which was enacted in March 2000, eliminates all slots at three of the nations slot controlled airports. Slots at the Chicago O'Hare airport will be eliminated by July 1, 2002 and slots at New York LaGuardia and New York JFK will be eliminated by January 1, 2007. PPP represents a market approach that should encourage the highest value services to use Logan Airport during periods of scarce capacity without the market disruption and other inefficiencies related to slot control.
85.55	Noise	Nighttime Noise	DEIS/DEIR should consider implementation of FAR Part 161 regulations to provide aircraft noise and access restrictions for Stage 2 and Stage 3 operations at Logan to provide noise relief to affected communities. A specific measure that could be considered is a cap on nighttime operations.	The phaseout of Stage 2 aircraft operations was complete as of December 31, 1999. Refer to response to Comment 85.26.
85.56	Regional Transportation	Regional Airports	The New England governors, the FAA, and the Federal Highway Administration must assist state government and the Boston area communities in devising and implementing programs to ensure that Massport's numbers grow no larger, while not inhibiting normal beneficial economic growth of Eastern New England. The Airside Improvement Project must be viewed in this larger regional context.	While Massport has no jurisdiction over the development, operation or use of infrastructure at airports other than Logan Airport, Hanscom Field, and Worcester Regional Airport, Massport is engaged in promoting the use of other alternative regional airports and travel modes to relieve traffic growth pressures at Logan Airport. For example, in November 1999, Massport and Governor Cellucci sponsored a Regional Transportation Summit that involved the New England Governors, transportation officials, and business leaders. The summit focused on joint marketing among the New England commercial service airports and the joint promotion of rail and road initiatives that will foster an efficient and balanced regional transportation system. Refer to Chapter 2 of the Supplemental DEIS/FEIR for a comprehensive discussion of Massport's regional transportation planning initiatives.
85.57	Regional Transportation	Regional Airports	Massport argues that the growth in passenger traffic experienced at the Manchester, New Hampshire Airport and the T.F. Green Airport in Warwick, Rhode Island represents shifts of demand from Logan Airport. It is equally likely that the introduction of those two airports of low-cost carriers has stimulated overall regional air travel growth, the bulk of which has been absorbed at those two airports.	Until Southwest Airlines, Delta Express and MetroJet introduced low-fare services into the region, the New England region had been one of the only regions in the United States without a significant low-fare carrier presence. The resulting stimulation of traffic at the regional airports consists of both induced demand and diversion from Logan Airport. This diversion results from a recapture of traffic within Manchester and T.F. Green/Providence airports primary markets that was previously using Logan Airport. The slowing of Logan Airport's growth rate is a clear indication that the new services at the regional airports have diverted traffic from Logan Airport. The induced demand resulting from Southwest Airline's low cost service is being accommodated at the regional airports and not at Logan Airport.

Code	Topic 1	Topic 2	Comment	Response
85.58	Regional Transportation	Regional Airports	If market forces are left to drive growth in traffic at those airports, growth at Logan will not be significantly constrained. Specific goals would have to be established, and a series of measures implemented to stimulate a substantial shift of traffic demand from Logan.	Market forces have been responsible for the shift in airport usage from Logan Airport to the regional airports. Since 1996, when low-fare services were first established at T.F. Green/Providence Airport, eight out of ten new air travelers in New England have chosen to use the regional airports over Logan Airport. Regional airports have become attractive alternatives to Logan Airport because of airline decisions to increase the frequency and quality of regional airport services (i.e., jet versus turboprops), the availability of lower airfares, convenient access relative to Logan Airport, and increased public awareness of the regional airports. Given this situation, growth is expected within Logan Airport's primary service area that will now shift to Manchester or T.F. Green/Providence airports.
85.59	Regional Transportation	Regional Airports	Although Massport includes some off-airport options, the development of other obvious alternatives has not been reasonably discussed nor have the reasons for their elimination as options.	The discussion of alternatives in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR responds to federal and state scoping directives and provides appropriate analytical context for assessing the need for the Preferred Alternative.
85.60	Regional Transportation	Regional Airports	The conclusion of the MAC Second Major Airport Study points out that long-term considerations to meet increasing demand require that a second airport (either a greenfield airport and/or significant expansion of an existing airport) be an alternative to the improvements recommended.	Refer to response to Comment 85.9.
85.61	Alternatives	Peak Period Pricing	Peak Period Pricing is but one form of economic incentive or control that should be considered in evaluating measures to reduce airspace and airfield congestion.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR contain analysis of PPP as a demand management alternative at Logan Airport. The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. Additional analysis of PPP is set out in Section 4.5 of the Supplemental DEIS/FEIR. This analysis includes the High Fleet scenario. Demand management measures at other United States and international airports are discussed in Section 3.5. For a review of demand management policies at other U.S. and international airports, refer to Section 3.5 of the Supplemental Draft EIS/FEIR.
85.62	Alternatives	Peak Period Pricing	The basic assumption was made that peak period pricing needed to be revenue neutral, pertaining only to airfield revenue and airfield costs at Logan. This assumption resulted in impacts to airlines that operate small aircraft only.	The PPP program evaluated in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR was designed to comply with pertinent U.S.DOT and federal court precedent in the PACE proceedings and with existing federal regulations regarding airport rates and charges. Revenue neutrality was incorporated in the tested program for this reason. Massport's prior experience with the PACE landing fee structure demonstrates that changes to the existing weight-based landing fees will undergo thorough legal and regulatory review, and that the program must be carefully structured to withstand this process. This was examined in developing the illustrative program.
85.63	Alternatives	Peak Period Pricing	Consideration should be given to a quite different approach to addressing the efficiency of Logan Airport during peak operating periods and in carrying out its primary mission.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. The application of a fixed peak period surcharge corresponds to the Citizens Advisory Committee's recommendation that an appropriate demand management program provide mechanisms to encourage the use of larger aircraft at higher load factors. Flights carrying greater numbers of passengers will minimize the cost per passenger impact of the surcharge.

Code	Topic 1	Topic 2	Comment	Response
85.64	Alternatives	Peak Period Pricing	Massport's model for peak hour pricing has chosen too narrow a definition of the regulatory criteria it must meet to establish a peak hour pricing structure.	Refer to response to Comment 85.62.
85.65	Alternatives	Peak Period Pricing	The range of options considered for Peak Period Pricing is insufficient.	The Airside Project analysis of PPP examined an operations threshold of 110 operations per hour, which is already below Logan Airport's normal operating capacity of 120 operations per hour. There is no legitimate operational justification for imposing a peak period surcharge at an operation level significantly lower than Logan Airport's normal operating capacity which is achieved 80 percent of the year without any delays. Even at 75 operations per hour, Logan Airport would be subject to delays from northwest wind conditions. The Airside Project analysis in the Airside Project Draft EIS/EIR and in the Supplemental DEIS/FEIR indicates that, with the Preferred Alternative, Logan Airport can accommodate existing and foreseeable future levels of demand without imposing a drastic administrative restriction to artificially revise Logan Airport's existing capacity.
85.66	Alternatives	Peak Period Pricing	The option of utilizing "costing" (including peak period pricing) approaches for the purpose of delay reduction should be retained. It should be the first option selected for implementation, as a non-capital intensive, adjustable measure to move toward a goal.	Analysis of PPP is set out in Section 4.5 of this Supplemental DEIS/FEIR.
85.67	Regional Transportation	Diversion	A shift away from air travel through reliance on other means of travel or communication is essential. Vigorous measures to foster and encourage this shift should be undertaken by State government in cooperation with Amtrak and telecommunications providers.	The acceptance of videoconferencing and other means of telecommunications by businesses as a substitute for air travel are largely dependent upon the quality of the available technology and private sector decisions outside the authority of FAA and Massport. Massport encourages such initiatives from state government, Amtrak, and others. Massport forecasts in the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR took account of the likely effect of such factors as videoconferencing over the forecast period.
85.68	Environmental Review Process	FAA/NEPA, MEPA	The DEIS/DEIR does not indicate the requirement of a benefit-cost analysis.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR respond to federal and state scoping directives and applicable FAA environmental orders and all other NEPA and MEPA requirements, and provide appropriate analytical content for assessing alternatives. According to 40 CFR Part 1502 Environmental Impact Statements Regarding Cost-Benefit analysis " for purposes of complying with the act, the weighing of the merit and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis..."
85.69	Noise	Studies	There are no economic analyses of the noise impacts regarding the various alternatives.	Analysis of noise impacts of the various airside alternatives was performed and is described in Chapters 6 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR. The noise analysis complies with federal and state scoping directives on the Airside Project Draft EIS/EIR and Supplemental DEIS/FEIR.
85.70	Environmental Review Process	FAA/NEPA	No indication of how the project is to be financed is provided . . .	The Airside Project is programmed into Massport's standard five-year capital budget process. An appropriate financing plan, including AIP funds and other grant funds, will be developed at the time the project is ready for financing. Sufficient funds will be available to complete the project.
85.71	Alternatives	Preferred Alternatives	Full impact of FAA not issuing a "Modification of Standards" for Layout Option C needs to be discussed.	A Determination of Acceptable Level of Safety, not a Modification of Standards, is required from FAA for Option C.
85.72	Alternatives	Runway 14/32	The commitment to maintain Runway 14/32 as a unidirectional runway is clearly reversible.	Refer to response to Comment 85.19.

Code	Topic 1	Topic 2	Comment	Response
85.73	Alternatives	Runway 14/32	Massport indicates that only regional and commuter aircraft will use the proposed runway. The Airport Reference Code (C-III) for the proposed runway includes the following aircraft types: Airbus A-320s, BAC 111s, Boeing 727s, Boeing 737s, Fokker F-28s, and MDC DC-9s. Therefore, large jets can and will use the runway.	Design Category C-III indicates the highest approach speed and widest wingspan of the aircraft to use the runway. Approach Category C includes those with speeds from 121 to 140 knots. Design Group III designates wingspans from 79 to 117 feet. Several of the general aviation and commuter aircraft have approach speeds or wingspans in these classes. Most of the types cited in this comment are Stage 2 aircraft that were phased out of service in 2000. Required runway takeoff and landing distances would prevent most of these aircraft operations on Runway 14/32. For operating efficiency, FAA controllers would keep the large jets on Runway 33L and the smaller aircraft on Runway 32.
85.74	Alternatives	Taxiway Improvements	The summary of advantages cited for the Centerfield Taxiway supports the community concern that the presence of the Centerfield Taxiway will make the use of the 4/22 runway combinations more attractive ...	The taxiway improvements are designed to improve ground movement efficiency and safety, and to reduce taxiing delays, thereby reducing associated noise and emissions. Section 3.3 of the Supplemental DEIS/FEIR describes several operating situations that would benefit from these improvements. Unidirectional Runway 14/32 would allow more evenly distributed runway use, reducing the use of the Runways 4/22 from 60 to 70 percent to 35 to 40 percent. When using Runways 22L/R for departures, the Centerfield Taxiway would be used for Runway 22L departures to bypass the queue for Runway 22R.
85.75	Alternatives	Peak Period Pricing	Massport is not including Alternate 1 as the preferred alternative, which according to its model provides the highest reduction in delay.	The analysis indicates that PPP is an effective option when airlines schedule beyond the normal hourly operating capacity of the airport and provides an assessment of the extent of the benefits from PPP under such circumstances. Analysis of PPP is set out in Section 4.5 of the Supplemental DEIS/FEIR.
85.76	Alternatives	Peak Period Pricing	The peak period pricing option or an alternative congestion approach should be implemented immediately to gain its delay-reduction benefits throughout and beyond any construction period.	Refer to response to Comment 85.66.
85.77	Air Quality	Odor	There are adverse air quality impacts associated with construction of Runway 14/32 and the Centerfield Taxiway that are not sufficiently explored in the DEIS/DEIR. These include odor impacts, especially in the Jeffries Point area, and potential construction dust problems.	Section 6.4 of the Supplemental DEIS/FEIR contains a thorough analysis of adverse air quality impacts. There are no anticipated odor-causing operations during the construction process. Fugitive dust from construction will be minimized by using methods described in FAA Advisory Circular 150/5370-10A, Standards for Specifying Construction of Airports.
85.78	Ecosystems	Rare Species	A major element of the proposal to mitigate impacts on the state-listed upland sandpiper, that of creation of a replacement habitat on Cape Cod, appears to ignore geography and is of questionable benefits.	Refer to response to Comment 85.35. In addition to shifting Upland Sandpiper habitat areas at Logan Airport from proposed construction sites to other grassland areas on the airfield, Massport has worked closely with NHESP to develop an off-site habitat enhancement plan for this species. The individual birds that use the airfield are part of a larger Upland Sandpiper population in Eastern Massachusetts. The proposed off-site habitat enhancement program will significantly improve regional opportunities for Upland Sandpiper and restore habitat for the declining population at Camp Edwards on Cape Cod. The on-site mitigation program is designed to maintain the existing population.
85.79	Alternatives	Runway 14/32	The commitment to maintain Runway 14/32 as a unidirectional runway is clearly reversible.	Refer to response to Comment 85.19.

Code	Topic 1	Topic 2	Comment	Response
85.80	Alternatives	Runway 14/32	... this project sends [the signal] that Massport continues to be committed to expansion of Logan Airport ...	The Preferred Alternative is a delay reduction program that promotes the efficiency and safety of airfield operations at Logan Airport. Runway14/32 enhances operating efficiency by providing a third available runway in weather conditions that require northwest-southeast operations. Similar three-runway configurations exist for all other operating directions. Runway 14/32 would not expand the overall capacity of the airport, since Logan Airport's normal operating capacity of 120 operations per hour, which is available approximately 80 percent of the year, is maintained with Runway 14/32. Massport is committed to ensuring that the airfield continues to function as efficiently as possible. The Preferred Alternative achieves this goal responsibly.
85.81	Alternatives	Preferred Alternatives	Alternate No. 3 provides delay reduction without the build option. Alternate No. 2 provides significant delay reduction by allowing maximization of existing airfield capacity through the construction of a parallel taxiway. These two alternatives appear to be the most viable for the community.	The Preferred Alternative contains the elements of Alternatives 2 and 3. The elements contained in Alternatives 2 and 3 are each part of the long-term delay reduction strategy for Logan Airport. However, only the proposed unidirectional Runway 14/32 addresses delays caused by northwest winds and the corresponding reduction in airfield capacity that occurs in this operating direction.
85.82	Analysis Assumptions/ Methodologies	Planning Period	... the DEIS/DEIR document should indicate: a) what the long-term (20-year) needs are.	The analysis in Chapters 4 of the Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR clearly indicate that airside delays and congestion at Logan Airport will worsen over the long term (ten- to 20-year time frame) if no actions are taken. The Preferred Alternative is designed to address the long-term need to reduce future growth in airside delays.
85.83	Purpose and Need	Delays	... the DEIS/DEIR document should indicate: b) how the alternatives considered meet these [long-term] needs.	Refer to response to Comment 85.82 and Section 4.6 of the Supplemental DEIS/FEIR.
85.84	Environmental Review Process	MEPA	Logan was constructed into a residential setting. The history of the airfield at Logan is noted in Appendix B but does not point out the residential development existing during the phases of development.	Comment noted. All planning efforts for Logan Airport, including the Airside Project, that are the subject of this environmental review take into account impacts on affected residential areas.
85.85	Environmental Review Process	FAA/NEPA, MEPA	Massport for too long has been allowed to take a segmented approach, arguing that landside projects are designed to accommodate ground passenger handling; airside improvement projects are designed to accommodate aircraft handling; that neither generates traffic; and that Massport has no control over passenger and cargo growth.	Refer to response to Comment 85.1.
85.86	Regional Transportation	Diversions	There needs to be a reallocation of roles and responsibilities, a primary objective of which should be to significantly temper the adverse impacts of air and ground vehicle operations to and from Logan Airport.	Massport has a long-standing commitment to minimizing and where possible, mitigating, environmental impacts associated with Logan Airport. The *Logan Airport 1999 ESPR* (previously GEIR) discusses the status of Massport overall mitigation for the groundside and airside impacts of the airport. The ESPR was filed on December 15, 2000.
85.87	Analysis Assumptions/ Methodologies	Base Year	This project, initiated in 1995 with the filing of an ENF, uses 1993 as its "base year" for planning purposes ... The passage of over five years from the "base year," ... should require that 1998 and data therefore constitute the "base year" for this Planning Project.	Refer to response to Comment 85.3.
85.88	Analysis Assumptions/ Methodologies	Planning Period	... the project should be extended to a 20-year planning horizon, to 2020 ... Massport claims that there has been no change in schedule ... This is untrue.	Refer to responses to Comments 85.3 and 85.40.
85.89	Environmental Review Process	FAA/NEPA MEPA	... Massport and the FAA have not complied with the required timing of the DEIS/DEIR document.	Massport and FAA have complied with all applicable state and federal requirements.
85.90	Analysis Assumptions/ Methodologies	Base Year	... the analysis uses baseline data of 1993 for a document submitted in 1999. [Is not appropriate]sic	Refer to responses to Comment 85.3.

Code	Topic 1	Topic 2	Comment	Response
85.91	Delay	Model	The FAA data on delays cited elsewhere in this report shows that the delay situation at Logan has improved since 1993 and is essentially in equilibrium, as assessed by the FAA.	Refer to response to Comment 85.4.
85.92	Purpose and Need	Delay	Massport has clearly demonstrated, by its action placing this project on hold for nearly two years, that the problem is not "a matter of priority."	Delay is a current problem that is only going to worsen. Massport is committed to improving airfield efficiency and reducing delays. Refer to Section 4.6 of the Supplemental DEIS/FEIR for a discussion of how the Preferred Alternative reduces airfield-related delays at Logan Airport.
85.93	Regional Transportation	Cargo	The ENF Certificate required ... discussion of diversion of cargo to off-airport alternatives.	The Secretary of Environmental Affairs found that "...the Draft Environmental Impact Report (DEIR) submitted on this project adequately and properly complies with the Massachusetts Environmental Policy Act..." Refer to the Certificate of the Secretary of Environmental Affairs on the DEIR, dated May 7, 1999. The potential diversion of cargo operations was not specifically analyzed because cargo operations account for only two percent of aircraft activity at Logan Airport and since most all-cargo aircraft operate during off-peak hours, cargo operations do not contribute to delays at Logan Airport. However, all cargo operations were included in the future fleets analyzed in the Airside Project. Additionally, some cargo is now being diverted to regional airports as indicated by the strong growth in cargo services and air cargo activity at the regional airports.
85.94	Regional Transportation	Regional Airports, Passenger Rail	The ENF Certificate required consideration of...the off-airport alternatives as a separate scenario evaluated during the DEIS/DEIR.	The Secretary of EOEA determined in the May 7, 1999 Certificate that the Draft EIR complied with applicable legal requirements. The certificate also provided a scope for the Final EIR in response to the May 7, 1999 scoping directives. Chapter 2 of the Supplemental DEIS/FEIR provides an evaluation of options to Logan Airport, regional airports and regional rail projects. These alternatives are expected to accommodate an increasing share of the region's overall growth in inter-city travel demand and provide relief to traffic growth pressures at Logan Airport. Nevertheless, the proposed Airside Project is necessary and provides clear benefits at current traffic levels. These benefits will only increase in the future, even as regional alternatives reduce the rate of future growth at Logan Airport.
85.95	Environmental Justice	Impacts	The ENF Certificate required consideration of ... the development of a second major airport in discussion of environmental justice.	Refer to response to Comment 85.9.
85.96	Delay	Model	The ENF Certificate required ... detailing of the existing delay derived directly from wind/weather and indirectly from delay at other airports.	The Secretary of EOEA determined in the May 7, 1999 Certificate that the Draft EIR complied with applicable legal requirements. Refer to response to Comment 85.10.
85.97	Noise	PRAS	The ENF Certificate required ... documentation of history of PRAS and problems implementing it.	Refer to response to Comment 85.11.
85.98	Environmental Review Process	MEPA	... DEIR is submitted subject to Massachusetts' laws, policies and regulations, in addition to federal regulations and guidance. As such, it is subject to the determination of the Secretary of Environmental Affairs as to whether cumulative impacts have been adequately addressed.	The Secretary of Environmental Affairs determined in the Certificate on the DEIR, dated May 7, 1999, that the document complied with all applicable state requirements.
85.99	Environmental Review Process	MEPA	The Airside Improvement Planning Program is a short-range and limited response to a major concern about long-term trends, future growth, and increasing impact. The DEIS/DEIR does not address the long-term implication of growth.	Refer to response to Comment 85.82.

Code	Topic 1	Topic 2	Comment	Response
85.100	Analysis Assumptions/ Methodologies	Passenger Forecasts	In our opinion, the statement (page 7-3) that "The Airside Project has independent utility, and will not stimulate, preclude, or otherwise determine other development anticipated as part of Massport's landside planning effort" is incorrect. Massport argues the Airside Improvement Project is independent of the landside projects in every way. We disagree.	Refer to responses to Comments 85.1, 85.16 and 85.17.
85.101	Environmental Review Process	FAA/NEPA	The full implementation of the Airside Improvement Project ... is expansion of capacity. Such as increase must be translated into a projected increase in demand, as the FAA has stated in its regulations.	Refer to response to Comment 85.80.
85.102	Analysis Assumptions/ Methodologies	Planning Period	This DEIS/DEIR ... does not cover a sufficient planning period. Massport continues the fiction that 1999 is the near future and 2010 the far future. As a standard, FAA typically reviews and evaluates 20-year forecasts. ... No justification for using these short time frames was given.	FAA has no standard that requires a 20-year forecast. Refer to responses to Comments 85.3 and 85.40.
85.103	Analysis Assumptions/ Methodologies	Forecasts	The base year for the development of these forecasts is 1993. ... A more updated forecast for passengers at Logan in future 5, 10, and 20 years with high and low fleet scenarios should be provided for evaluation.	Refer to response to Comment 85.40.
85.104	Analysis Assumptions/ Methodologies	Base Year	... Massport cites significant changes since 1993 in the aircraft fleet mix; thus, the validity of the base year and high-range fleet forecasts are not appropriate for consideration in this analysis.	Consistent with the request made by the EOEA in its Certificate on the Draft EIR, the Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and provide context to the delay problem at Logan Airport. The High and Low Fleet scenarios for 37.5 and 45 million passengers represent a range of possible future activity—both levels and fleet mix—at Logan Airport.
85.105	Analysis Assumptions/ Methodologies	Passenger Forecasts	Massport should provide recent and relevant passenger forecasts for a 20-year period with associated operational forecasts using high and low fleet scenario assumptions that are consistent for all forecast years.	Refer to response to Comment 85.40.
85.106	Analysis Assumptions/ Methodologies	Passenger Forecasts	The DEIS/DEIR does not indicate the detailed methodology used to develop the levels of passenger forecasts presented. ... Massport must clearly identify the basis for the passenger demand projections, and must state the confidence level in those projections. Similarly, it must state the confidence level in the projections of diversion at each projected passenger level, and show the resultant range of passenger level projections.	The Airside analysis is based on a range of historic, current and future passenger levels. The Airside Project Draft EIS/EIR included the analysis of 1993 Historic Modeled Conditions with 24 million passengers. The Supplemental DEIS/FEIR was updated to reflect 1998 current conditions, i.e.: 26.5 million passengers. To account for the uncertainty associated with any forecasting effort, the Airside analysis considered a range of future passenger levels from 29 million (expected to be reached in 2003), to 37.5 million (2015), and 45 million (2024). Furthermore, the results of the Airside analysis indicate that the delay reduction benefits of the Preferred Alternative are not dependent upon the future forecast passenger level. As demonstrated in Section 4.6 of the Supplemental DEIS/FEIR, the Preferred Alternative would produce significant delay reduction at current, 1998 activity levels, as well as the wide range of current and future forecast passenger levels.
85.107	Analysis Assumptions/ Methodologies	Passenger Forecasting	The distinction between the "low operations fleet" and the "high operations fleet" is confused in the DEIS/DEIR.	As described in Chapter 4 and Appendix E of the Airside Project Draft EIS/EIR and in Section 4.2 of the Supplemental DEIS/FEIR, the high fleets are characterized by comparatively larger number and share of operations with smaller regional carrier aircraft, consistent with the three carrier network observed in the early 1990's. The low fleets exhibit fewer small aircraft and a larger average aircraft size at Logan Airport, resulting in fewer aircraft operations required to accommodate the specified number of passengers. The alternative fleet forecasts examined in the Airside analysis permitted Massport and the FAA to compare the relative merits of different improvement concepts against a wide range of current and potential future activity levels.

Code	Topic 1	Topic 2	Comment	Response
85.108	Noise	Fleet Mix	... the percentage distribution of passengers between "passenger jets" and "regional carriers" presented ... indicate that most of the projected increases in passenger demand will be met by increased operations of the "passenger jet" fleet. This is the fleet that creates the noise impacts at Logan and elsewhere.	Refer to response to Comment 85.22.
85.109	Analysis Assumptions/ Methodologies	Cargo	It should also be noted that cargo fleet operations in 1999 were held constant in both the "low fleet" and the "high fleet" projections ... the increased economic growth projection ... should also include a concomitant increase in the cargo jet operations forecast ... These corrections will affect the noise and noise impact forecasts of Chapter 5 and Appendix L.	Cargo activity at Logan Airport changes from year to year. Despite strong economic growth over the last few years, cargo operations at Logan Airport increased by less than two percent in 1999 and actually declined by 1.2 percent in 1998. Since cargo operations account for only two percent of aircraft activity at Logan Airport and occur during off-peak hours, cargo operations do not contribute to delays at Logan Airport. By reducing delays during the peak hours, the Preferred Alternative reduces the number of passenger operations that are delayed into the nighttime and thus reduces late night noise exposure for the surrounding communities.
85.110	Analysis Assumptions/ Methodologies	Planning Period	In our opinion, Massport should be carrying its projections a minimum of 20 years from a base year of 1998, for a draft environmental impact statement and report published in 1999.	Refer to responses to Comments 85.3 and 85.40.
85.111	Noise	Fleet Mix	Massport projects air traffic operations to increase substantially over the project planning period. ... A more important assessment is the projected increase in "equivalent jet operations," which ... approaches 50% over the next decade.	While equivalent jet operations increase by more than 50 percent from a 1993 base to the future 37.5M High Fleet scenario if the Preferred Alternative is implemented, the appropriate basis for comparison of the Preferred Alternative is the No Action Alternative. Equivalent jet operations would increase by more than 75 percent over the Preferred Alternative if no action were taken. Despite the increase in equivalent jet operations, the Airside analysis indicates that overall noise impacts decline over time with the elimination of Stage 2 aircraft and the replacement of hushkitted Stage 3 aircraft with non-hushkitted Stage 3 aircraft. By allowing aircraft operations to shift from over-land to over-water routings and by providing greater flexibility in the use of Runways 27 and 33L for takeoff, the Preferred Alternative further reduces the highest noise impacts to the close-in neighboring communities.
85.112	Ground Transportation	Access to Logan Airport	Massport proposes to increase the percentage of passengers accessing Logan Airport who do so in high-occupancy vehicles, but its proposal falls far short of absorbing the full projected increase in passenger ground access requirements.	The *Logan Airport 1999 ESPR* (previously GEIR) which filed on December 15, 2000, evaluates the feasibility of a higher target percentage for air passenger HOV ridership than 35.2 percent and discusses parking demand and management.
85.113	Regional Transportation	Regional Airports	A new class of much larger aircraft is under active development by several manufacturers. ... Their size and height, and the number of passengers, pose significant terminal problems. They are expected to require runways of about 11,000 feet in length. ... This therefore becomes another argument for the development of a major international airport serving New England that will have the capacity and capability to handle this generation of planes.	The Airside Project analysis is based on alternative 20-year forecasts of operations by aircraft type. Only larger aircraft compatible with the existing facilities at Logan Airport are included in the future forecasts for Logan Airport fleets on which the delay and environmental analyses are based. Also, refer to response to Comment 85.9.
85.114	Mitigation	Initiatives	These documents fail to address how Massport, the air transportation system, and the regional transportation and communication systems will cope with continued passenger and operations growth while simultaneously maintaining and improving environmental quality and quality of life, and an efficient transportation and communication system in the future.	The Airside Project Draft EIS/EIR and the Supplemental DEIS/FEIR analyze the environmental impacts of the Airside Project, consistent with established federal and state scoping directives. Appropriate mitigation associated with the Airside Project has also been established. Massport has programs in place to reduce the environmental impacts associated with Logan Airport as a whole. These initiatives are described in the *Logan Airport ESPR* and its updates.

Code	Topic 1	Topic 2	Comment	Response
85.115	Noise	PRAS	Massport argues that the project "will not result in the division or disruption of established communities." This must refer solely to physical division or disruption, since Massport's promotional and political strategy has clearly been to effect division among the communities around Logan Airport. Some of these communities will be further disrupted by the short-term shifts in runway usage which are the basis for Massport's claims of "net benefits", all will be disrupted by further growth in Logan air operations over the near and far futures. Furthermore, this is the last possible physical project to increase Logan airfield capacity that could be undertaken without "division or disruption of established communities," or of the waters of and lands under Boston Harbor.	Projected changes in flight patterns and associated noise shifts are consistent with the PRAS goals, which were studied and approved by the community when established. Activity increases over certain communities are offset by activity reductions over other severely impacted communities and by activity increases over water.
85.116	Noise	Hushkitted Aircraft	Concerned that aircraft operations will continue to increase with the noise impact per operation unlikely to diminish.	The noise impact per operation is expected to diminish in the future for several reasons. The two largest airlines at Logan Airport, Delta Air Lines and US Airways are replacing their hushkitted shuttle fleets with full Stage 3 aircraft. US Airways took delivery of Airbus 320 aircraft in the fall of 1999 and Delta Air Lines has ordered Stage 3 Boeing 737-800s for its Boston to New York shuttle operations. By the end of 2000, approximately 24,000 annual operations were replaced by full Stage 3 technology aircraft.
85.117	Purpose and Need	Delays	It seems inevitable that Logan Airport will experience growing congestion, and with that congestion will come increasing pressure for additional measures to reduce it.	The Airside Project analysis shows that the Preferred Alternative will significantly reduce the growth in airside delays compared to the No Action Alternative. Refer to Section 4.6 of the Supplemental DEIS/FEIR. Massport will continue to examine ways to make Logan Airport more efficient.
85.118	Environmental Review Process	MEPA, FAA/NEPA	... The DEIS/DEIR should be found inadequate, ...	Refer to response to Comment 85.12.
85.119	Environmental Review Process	MEPA	The boundaries of the Airfield Study Area, Figure 5.1-2, should be extended to include the Hyatt Hotel and the waters to the east of Governor's Island, in order to include the runway safety areas and other protective envelopes.	The study area shown in Figure 5.1-2 of the Airside Project Draft EIS/EIR is intended to include all aircraft movement areas at Logan Airport.
85.120	Noise	Impacts	Concerned the 60 DNL contour does not include any areas of Milton/Quincy/Braintree, nor the town of Hull, whose residents are distressed by airport noise.	The Secretary of Environmental Affairs has requested that Massport examine noise exposure out to the 60 DNL contour. There is no evidence either from noise exposure contours or from measurements to suggest these communities experience noise greater than DNL 60. Also refer to Figure 5.2-3 and Table 5-6 of the *Logan Airport 1998 Annual Update*.
85.121	Noise	Impacts	The most salient observation is that "equivalent operations" will increase substantially over almost all areas over time. ... while the different alternatives slightly shift overflight impacts among communities, most residential areas will experience significant increases in impacts over time.	Refer to response to Comment 85.111.

Code	Topic 1	Topic 2	Comment	Response
85.122	Noise	Impacts	The plan to add another runway on the southern boundary of the airport will definitely alter the noise patterns for those south and southwest of the proposed runway....The South Boston and Jeffries Point areas will definitely have an increase in noise above 60 dB and possible above 65 dB. ... There is forecast to be an increase of five or more dB in approximately a three square mile area on the south shore of the Inner Harbor.	The only change in the shape of the noise contours from the addition of Runway 14/32 is the addition of a contour into the harbor in the general direction of the extended runway centerline (refer to Figures 6.2-5 through 6.2-14 in the Supplemental DEIS/FEIR). No increase is forecast for Jeffries Point (refer to Tables 6.2.4, 6.2.5, and 6.2-22 in the Supplemental DEIS/FEIR). Also, the Day-Night Sound Level for Noise Monitor No. 2 at B Street and Bolton Street in South Boston is expected to *decrease* (not increase) from 66.7 decibels (dB) in 1998 to between 63.4 and 64.5 dB with the 29M Low Fleet scenario, depending on the alternative; to between 58.7 and 63.8 dB with the 37.5M High Fleet scenario, and to between 58.1 and 63.0 with the High Regional Jet Fleet, depending on the alternative.
85.123	Noise	Model	Two sensor sites to the west-northwest of the airport are those at the Jeffries Point Yacht Club and at Summer, near [Lamson] in East Boston....According to the day-night contours in the analysis, the noise level would never reach 60 DNL. The Times Above Noise Levels (TANL) tables contradict these figures. ...	There is no contradiction between the tables of Day-Night Sound Level (DNL) values at the noise monitoring sites and the Time Above (TA) threshold values. The graphics in Appendix L of the D EIS/EIR and the new graphics in the Supplemental DEIS/FEIR (for example Figures 6.2-7 and 6.2-8 showing exposure levels for the 29M Low and 37.5M High fleets) indicate that both sensor sites (Sites 14 and A, respectively) are properly situated on or between the 60 and 65 DNL contours, their locations accurately matching the tabular values of DNL listed in Tables 6.2-10 and 6.2-of Supplemental DEIS/FEIR. Comparable comparisons also exist between the noise contours of Figure 6.2-12 and Table 6.2-26 of the Supplemental DEIS/FEIR for the 2015 High Regional Jet Fleet. However, the commentor appears to be confused over the difference between the DNL and Time Above noise metrics. The time-varying sound level of a passing aircraft can rise to a numeric value that exceeds a threshold of say 65 dB, then fall back below that threshold and in so doing will add several seconds to the Time Above noise metric. Yet that threshold exceedance does not mean the DNL value (a cumulative measure of exposure for a full 24-hour period) will be greater than 65 dB. Readers unfamiliar with these technical issues should refer to Section 5.2.3 of the DEIS/EIR, *Appendix G of the Logan Airport 1998 Annual Update,* or Appendix E of this document for background explanations of the noise metrics used in this evaluation.
85.124	Noise	PRAS	PRAS goals are advisory...We believe airfield operations are unlikely to attain, and even less likely to sustain, the progress toward attainment of PRAS goals that Massport projects. Therefore, the projected noise reduction "benefits" of the proposed project for the communities impacted by operations using the 4/22 Runways are not likely to be attained or, if attained, to be sustained.	Refer to response to Comment 85.20.
85.125	Noise	Hushkitted Aircraft	The number of nighttime jet operations can be expected to double within the foreseeable future under conservative forecasts. The noise impacts of this increase are huge. All nighttime operations of jets weighing over 75,000 pounds are required to be of Stage 3 aircraft, at this time. Therefore, the growth in numbers and percentage of nighttime jet operations will not be mitigated by the conversion to Stage 3 aircraft.	Refer to response to Comment 85.25.
85.126	Noise	Nighttime Noise	An alternative [to the projected increase in nighttime operations] that should be considered is the creation of a cap on nighttime operations pursuant to FAR Part 161.	Refer to response to Comment 85.26.

Code	Topic 1	Topic 2	Comment	Response
85.127	Noise	Nighttime Noise	There has been a program at Logan for preferential use of over-water approaches and departures, in effect from midnight to 6:00 a.m. The DEIS/DEIR should report on the current status of the program, and discuss/explain the apparent diminution in its application.	The *Logan Airport 1998 Annual Update* indicates that late night preferential runway use improved on an annual basis in 1998. Also refer to Section 4.3.6 of the Supplemental DEIS/FEIR for a discussion of the impact of extending the late-night overwater routing preference to begin earlier than midnight.
85.128	Noise	Nighttime Noise	Comparison of the report of the flight track monitoring program in the 1994/1995 GEIR Update with that reported in the 1997 GEIR Annual Update shows the following. While the number of aircraft departing Runways 22 that subsequently cross the Hull peninsula on their westbound leg did not increase appreciably, the percentage of aircraft crossing that peninsula below 6,000 feet increased from about 8% to about 42%...It appears from the data that a significant percentage of operations failed to conform to the procedure in two ways—the Hull peninsula was crossed, and it was crossed at less than 6000 feet altitude.	While the current use of Runway 22 L/R for departures exceeds the PRAS goal (Refer to the *Logan Airport 1998 Annual Update*, Table 5-12), the Airside Project analysis indicates that, with the Preferred Alternative, use of Runway 22 for departures will fall below the PRAS goal under future short-term and long-term scenarios. The analysis also shows that Runway 22's departure use will exceed its PRAS goal in the long term if no actions are taken.
85.129	Noise	Nighttime Noise	The 1997 GEIR Study does not report on compliance with the flight tracks for Runway 27 departures as established by the FAA in 1996.	Both the *Logan Airport 1997 Annual Update* and *Logan Airport 1998 Annual Update* reported that aircraft were not achieving the goals of the 1996 FAA ROD and that further testing was needed to get improved conformance. The FAA is currently funding an analysis of the procedure and meets periodically with the Runway 27 Advisory Committee to report interim findings. The *Logan Airport 1999 ESPR* (previously GEIR) reports on flight track monitoring which includes Runway 27 test results. The Runway 27 departure tracks have been reviewed in more detail in Section 4.3.4 of the Supplemental DEIS/FEIR.
85.130	Noise	Hushkitted Aircraft	The Logan Low Frequency Noise Study reported in 1996 by Harris, Miller, Miller & Hanson, Inc. indicates that Massport overstates the benefit of further conversion to Stage 3 aircraft on future noise levels around Logan Airport.	Refer to response to Comment 85.24.
85.131	Noise	Monitoring	[Asks that specifics of each noise event be included which] might allow those concerned to better understand community perceptions of aircraft noise and the lack of broad community acceptance of the use of DNL contours as an adequate means of expression of aircraft noise impacts.	It is impossible to show the specifics of each noise event for each location. Rather, the Supplemental DEIS/FEIR provides data at 23 sites, mostly noise monitoring locations, to enable comparisons to measurements and to provide information in several metrics. Included are the annual Day-Night Sound Level for each fleet scenario, the nighttime Leq, the 24-hour and the nighttime Time-Above threshold and the maximum, single event, sound levels. This constitutes a comprehensive set of data, enabling a statistical view of the noises during the average 15-hour day and nine-hour night.
85.132	Noise	Sound Insulation	... acoustic treatment should not be regarded as a full substitute for reduction in ambient levels of aircraft noise.	Massport's FAA-approved sound insulation program is only one element of the noise abatement program. For a discussion of the noise abatement program, refer to the discussion in the *Logan Airport 1994/1995 GEIR* and the *Logan Airport 1998 Annual Update*. Massport has existing actions initiatives underway that reduce noise impacts on nearby communities, including: Noise abatement and runway use restrictions; Exploring means of extending the Logan Airport sound insulation program through innovative investigation of hill effects on sound propagation; Encouraging growth at Worcester Regional Airport and other alternative airports; and Monitoring and improving achievement of PRAS goals.

Code	Topic 1	Topic 2	Comment	Response
85.133	Noise	Sound Insulation	Concerned that FAA eligibility rules makes ineligible for AIP funding any non-related code-required building improvements necessary to accommodate acoustic treatment improvements. This may impose significant burdens on some property owners.	Refer to response to Comment 85.30.
85.134	Noise	Sound Insulation	Another concern is the failure to provide air-conditioning in conjunction with the "soundproofing" program.	Refer to second paragraph of response to Comment 85.29.
85.135	Noise	Sound Insulation	A further concern is the eligibility of dwelling units for the program. At present, eligibility is determined by the location of the unit within the 65 DNL noise contour, as determined by the application of the Integrated Noise Model. Massport should consider whether other factors should be included in the determination of eligibility that might not be adequately captured by the use of the 65 DNL noise contours. Consideration should also be given to establishment of an interior noise level goal for the program regardless of location of the dwelling unit.	Massport has investigated possible hill effects to explain some larger differences at individual sites and plans to petition FAA for approval to modify the INM contours, where applicable. FAA policy on sound insulation already includes an interior design goal. FAA Order 5100.38 states "A 45 Ldn [DNL] within the major habitable rooms of a dwelling is considered the reasonable design objective for selecting noise attenuation measures". The policy also requires that a minimum of 5 dB of noise reduction be provided by a treatment to assure that the benefit will be noticeable.
85.136	Noise	Sound Insulation	The shortcomings of the INM [Integrated Noise Model] should be recognized and accommodated in the further development of the acoustic treatment program and with respect to eligibility for the program.... Credence should be given to the measured values in determining eligibility and design of corrective measures.	Differences between measured and modeled sound levels have been reported in Logan Airport's various GEIRs and Annual Updates for a number of years. Differences at close-in locations were significantly reduced in 1996 through modification of source levels to better account for over-water sound propagation and apparent use of higher engine power settings than are normally assumed in the noise model's database (Refer to Appendix F of the *Logan Airport 1996 Annual Update*). In 1998, differences between measured and modeled noise became even less when Massport upgraded its monitoring system and began to report noise caused only by aircraft -- a metric directly comparable to the DNL exposure levels predicted by the noise model. At sites having exposure levels of 60 dB or more, this improvement to the monitoring system brought measured and modeled DNL values to within 0.2 dB of each other. (Refer to Chapter 5 of the *Logan Airport 1998 Annual Update*). Massport continues to investigate possible causes for remaining differences (such as from hill effects) but believes the FAA's INM noise model used in the Airside Project noise analyses accurately represents expected noise exposure.
85.137	Noise	Sound Insulation	Want discussion on adequacy of school soundproofing program.	The Airside Project does not adversely affect any schools. In response to the SDEIS Panel, the Supplemental DEIS/FEIR includes a school day/school year contour.
85.138	Air Quality	Odor	Changes in odor impacts are most likely to occur in the Jeffries Point neighborhood from takeoffs on Runway 14...This would constitute a new source of odors in the Jeffries Point area and would also affect the Hyatt Hotel.	One-hour VOC concentrations (used as an indicator of odor) increase only slightly at Jeffries Point with the Preferred Alternative, when compared to the No Action Alternative. The predicted increase is so small that changes in odor will remain imperceptible, as measured against the No Action Alternative. Concentrations decrease at all other receptors with the Preferred Alternative.
85.139	Air Quality	Model	Increased use of Runway 15 for takeoffs can be expected to have an influence on odor impacts downwind of Runway 15 in the Bremen Street/Eagle Hill area of East Boston...An odor receptor location in East Boston representing the most proximate residential receptor located along or near the extended centerline of Runway 15R/33L should have been selected for odor modeling rather than Location 10 at the intersection of Condor and Glendon Streets.	Receptor No. 10 is representative of conditions in East Boston and is located near the runway centerline. East Boston is bracketed by the receptors placed at Receptor No. 10, at Eagle Hill, and at Jeffries Point.

Code	Topic 1	Topic 2	Comment	Response
85.140	Air Quality	Odors	The construction and use at the Centerfield Taxiway would change odor impacts in the Bayswater Street area of East Boston...[and] place taxiing aircraft closer to the Court Road section of Winthrop, where the odor impact would depend on the crosswind component during operations on Runways 4 and 22.	The emission inventory results show that the Airside Project, including the Centerfield Taxiway, would lead to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. The small changes in emission concentrations at Bayswater Street, East Boston, and Winthrop will meet federal standards for hydrocarbon emissions.
85.141	Air Quality	Odor	... the introduction of a new source [of odor emission] as in the case of Runway 14, is very likely to be detected, noted, and complained of. The same is probably true of an increase in frequency at which detectable odors are present, as could be the case for increased use of Runway 15 for takeoffs.	The Airside Project associated with Runway 14/32 would decrease overall odor-causing hydrocarbon emissions when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. The dispersion analysis indicates that the Preferred Alternative will have lower concentrations of odor-causing VOCs at all receptors other than at Jeffries Point. The minor increase at Jeffries Point is expected to be indistinct from the No Action Alternative.
85.142	Air Quality	Odor	Improvements in efficiency of ground taxi operations, while potentially yielding or resulting in reduction in odorous emissions generally on the airfield are not likely to be detected in the neighborhoods as reductions in odor intensity.	The Airside Project leads to a decrease in odor-causing hydrocarbon emissions, when compared to the No Action Alternative. This is illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR. Small changes in odorous emission concentrations will be imperceptible as measured against the No Action Alternative.
85.143	Air Quality	Impacts	The modeled increase in one-hour predicted levels of Volatile Organic Compounds ("VOCs") is of particular concern...It appears from the modeling results that the principal determinant of overall changes in VOC emissions would be the Taxiway Improvement Program. Runway 14/32 would have little impact...	Although VOC emissions increase over time because of increased aircraft operations activity at Logan Airport, emissions are lower with Alternatives 1 and the Preferred Alternative, when compared to the No Action Alternative. The decreases are attributable to both the proposed Runway 14/32 and the taxiway improvements.
85.144	Analysis Assumptions/ Methodologies	Base Year	The direct or indirect comparison of various alternatives to the baseline year 1993 is misleading. Conditions have changed substantially since 1993 in many respects, and emission rates for the various alternatives and for the various scenarios should be compared to 1998, the most current year for which operational data are available.	The projections of future airfield delays at Logan Airport are not based on analysis and modeling of delays which occurred during 1993. The analysis for 1993 was included in the Airside Project Draft EIS/EIR to provide historical perspective to the delay problem at Logan Airport and for use in model calibration. The Supplemental DEIS/FEIR includes delay and environmental analyses for 1998 to reflect current conditions and to provide context to the delay problem at Logan Airport. The appropriate comparison for assessing future year conditions and the effectiveness of the Airside Project is a comparison of the Preferred Alternative to the No Action Alternative, not a comparison of the Preferred Alternative to the base year.
85.145	Air Quality	Model	It is unclear why aircraft VOC emissions are not projected to increase with increasing numbers of aircraft operations. The KM Chng Environmental Study of 1996 reports that high-power operations may be significant sources of emissions of odorous compounds despite lower concentrations during that mode of operation, because of the high volume of contaminants discharged, yet this mode was not incorporated in the "odor emission" estimates.	Total VOC emissions increase with increased aircraft operations. However, low-thrust mode VOCs are reduced because of more efficient airfield operation (less delay). These emissions are most closely attributable to odor events.
85.146	Air Quality	Model	Massport should have used the same ten-year hourly average meteorological input for the air quality dispersion model [as was used for the DELAYSIM Model], and should be required to rerun the dispersion model for all of the conditions modeled for the DEIS/DEIR.	Refer to response to Comment 85.34.
85.147	Air Quality	Model	The use of the EPA Industrial Source Complex Dispersion Model utilizes too long an averaging time to adequately model peak odor concentrations...	A one-hour averaging time was used as the basis for all modeling results. This method is appropriate for estimating peak period concentrations.

Code	Topic 1	Topic 2	Comment	Response
85.148	Air Quality	Model	The modeling that was performed should be supplemented by the application of a "puff" model utilizing reasonable worst-case dispersion and dilution conditions and short-term peak emission rates, ...	Worst-case meteorological conditions have been modeled. Actual weather data and temporal aircraft distribution modeling were used to determine peak hours, days, and months of operations. Thus, true worst-case conditions have been modeled and supplemental modeling would not be instructive.
85.149	Air Quality	Model	No references are given for the assertion that newer engines associated with Stage 3 aircraft produce lower hydrocarbon emissions...Thus, the assertion that odorous emissions will decrease over time has not been substantiated.	Low-thrust mode VOCs are reduced because of more efficient airfield operation (less delay). These emissions are most closely attributable to odor events.
85.150	Ecosystems	Rare Species	The suggested program appears highly speculative...Massport should be required in the DEIS/DEIR to define a project fully acceptable to the Massachusetts Natural Heritage and Endangered Species Program that involves creation of a comparable habitat and its protection and preservation in the Metropolitan Area.	Refer to responses to Comments 85.35 and 85.78. Massport's program responds to directives from the EOEA and to its Natural Heritage and Endangered Species Program goals and guidelines.
85.151	Water Quality	NPDES permit	The presentation for minimizing water quality impacts during construction is completely inadequate and is substantively limited to the one paragraph on page 6-94.	Construction for Runway 14/32 and the Centerfield Taxiway would include excavation of unsuitable substrate, placement of clean new fill, and some regrading. Because of the flat topography on the airfield, erosion is more controllable than on more variable topography. As detailed in Section 6.9.4 of the Supplemental DEIS/FEIR, site-specific Stormwater Pollution Prevention Plans will be developed during design and as part of the NPDES construction permitting process. These measures will likely include siltation fencing, hay bales, sediment sumps, detention tanks, water quality monitoring and weekly Best Management Practices inspections.
85.152	Soil	Testing	Massport has performed no soil sampling and analysis in the principal areas of proposed excavation for the planned construction projects.	A sampling and analysis program to characterize soil conditions in potential construction areas was developed in support of the Supplemental DEIS/FEIR. The sampling and analysis involved the taking of 93 soil borings during July and August 1999 to determine both soil quality and structural characteristics. A summary of laboratory data and characterization of soils to be excavated is presented in Section 6.7.3 of the Supplemental DEIS/FEIR.
85.153	Soil	Reuse/ Disposal Options	Massport has indicated that the principal means of disposal of excavated material will be as landfill cover and contouring material. ... the Central Artery Project has substantially saturated the demand for materials for those purposes ...	Since filing of the Draft EIS/EIR, stockpiled materials at Governors Island have been moved off-site in response to a request from the receiver of the Rubchinuk Landfill in Middleton, Massachusetts. Section 6.7.4 of the Supplemental DEIS/FEIR describes this effort and identifies suitable reuse options for the remaining materials to be excavated.
85.154	Soil	Testing	... no assumption should be made about the chemical characteristics of the underlying material.	Refer to response to Comment 85.152.
85.155	Soil	Reuse/ Disposal Options	... management and disposal [of soil] is a significant program. The DEIS/DEIR treats this matter far too casually.	Refer to response to Comment 85.153.
85.156	Construction	Schedule	The statement that construction work with limited exception would only occur during the months of January, February and March, weather permitting, is puzzling. It is not consistent with Table 6.7-3; ... This matter needs to be clarified.	The only construction work proposed for the months of January, February and March is that associated with the demolition of Cargo Buildings 60 and 61. All other work associated with construction of Proposed Runway 14/32 and the taxiway improvements is proposed for the period of April through December.

Code	Topic 1	Topic 2	Comment	Response
85.157	Construction	Mitigation	Need to discuss construction worker access to site and related potential parking issues.	Runway and taxiway construction is similar to highway construction and is not labor intensive. As few as two and as many as 50 to 75 people would be working on the Airside Project construction at any one time, with an average of 15 to 20 workers on-site during a typical shift. By comparison an average of 15,000 non-construction employees work at Logan Airport on a daily basis. Parking on-site will be limited. Under Massport's construction period mitigation program, construction workers will be subject to a contractually required transportation management program. Workers are expected to commute to and from the construction site by using public transportation or high occupancy vehicles, such as shuttles or buses.
85.158	Construction	Air Quality	Massport has failed to demonstrate how fugitive dust emissions from construction operations on the airfield during winter months will be controlled.	Refer to response to Comment 85.36.
85.159	Construction	Mitigation	Wheelwash facilities generate considerable quantities of silt and sediment-laden water. Massport has not discussed how discharge of these contaminants will be controlled.	Wheelwash water will be discharged to grass areas on the airfield. This allows for the settling of sediments and the infiltration of water into the ground. Catch basins will be protected by silt fences or other suitable sediment barriers
85.160	Construction	Noise	Massport proposes to use the Federal FHWA Criteria for construction noise impact. Massport fails to recognize the criteria applied by Massachusetts Department of Environmental Protection, which limit construction noise increases to 10 dB(A) above background and prohibit pure tones as defined by DEP (DEP Policy 90-001). These criteria are applicable to this project.	The DEP identifies two criteria against which construction noise can be judged: it cannot increase ambient levels by more than ten dB, and it cannot produce a "pure tone" condition. Section 6.9.4 of the Supplemental DEIS/FEIR contains an analysis of construction noise with reference to these criteria. Refer to Comment 85.37.
85.161	Noise	Nighttime Noise	Other shortcomings of the Massport construction noise analysis are its failure to address the matter of pure tones and of impact noise and the failure to separate out and separately analyze nighttime construction noise levels against nighttime ambient levels ...	A discussion of nighttime construction noise levels has been included in the Supplemental DEIS/FEIR. The analysis of nighttime construction noise levels does not show any significant impact from construction noise.
85.162	Construction	Traffic	How will construction vehicles accessing or exiting via the North Gate be precluded from use of local streets?	The use of Neptune Road for *direct* connection to Route 1A (Northbound entrance ramp or southbound exit ramp) is the only portion of Neptune Road approved for contractor access or egress. This requirement will be contained within the contract specifications for the Airside Project.
85.163	Construction	Stormwater	The Soils Use Policy and the Stormwater Pollution Prevention Plan should be available for and subject to public review and comment.	The Massport Soil Use Policy and Stormwater Pollution Prevention Plan are available for review through the Massport Environmental Unit.
85.164	Noise	Sound Insulation	The statement is made, "After sound-proofing to mitigate impacts within the 65 YDNL Contour, the full-build alternatives provide net long-term benefits." We disagree with this statement.	Refer to response to Comment 85.28.
85.165	Air Quality	Odor	There is potential for adverse odor impacts in certain areas proximate to the airport, as a result of this project.	Odor impacts are generally lower with the Airside Project than without, as illustrated in Table 6.4-7 and Figure 6.4-5 of the Supplemental DEIS/FEIR.
85.166	Construction	Traffic	The statement expressing total peak construction trips as a percentage of the average annual daily traffic on the regional highway system is misleading, since most of the construction-related traffic consists of heavy vehicles.	Refer to Section 6.9 of the Supplemental DEIS/FEIR for an updated analysis of truck trips.
85.167	Environmental Review Process	FAA/NEPA	Federal planning policy establishes that this project must be considered and evaluated as stimulating growth in aircraft operations at Logan. The DEIS/DEIR makes a clearly contrary statement (page 7-3): ...	Refer to response to Comment 85.16.
85.168	Analysis Assumptions/ Methodologies	Planning Period	The planning period is inadequate, and should be extended to 2020.	Refer to responses to Comments 85.3 and 85.40.

Code	Topic 1	Topic 2	Comment	Response
85.169	Alternatives	Delay	There is no plan or program to deal with long-term growth at Logan, which will soon overwhelm any interim benefits of this project. There are measures that could be instituted to effectively address transportation in eastern New England, but there is no discussion in this document.	Refer to response to Comment 85.14.
85.170	Environmental Review Process	MEPA	...the Secretary of Environmental Affairs should determine that these significant planning deficiencies exist in the DEIS/DEIR that must be addressed. The DEIS/DEIR should be found inadequate, and a new Draft document should be required.	Refer to response to Comment 85.12.
85.171	Purpose and Need	Delays	Delay does not appear to be a major problem at Logan, based on FAA reports and Massport's 5-year history of inaction.	The FAA consistently rates Logan Airport as one of the most delay prone airports in the United States. Logan Airport's estimated annual delay hours are over five times the FAA's threshold of 20,000 hours for a severely delayed airport. Refer also to response to Comment 85.4.
85.172	Analysis Assumptions/ Methodologies	Passenger Forecasts	This project and landside projects at Logan are interdependent, and both will increase capacity and stimulate demand.	Refer to responses to Comments 85.1, 85.16, 85.17 and 85.80.
85.173	Cumulative Impacts	Master Plan	The Airside Improvements Project is already "divisive and disruptive of established communities," and prospects for the long term are significantly worse.	Refer to response to Comment 85.115.
85.174	Noise	Sound Insulation	With respect to Section 7.3.1, Noise, it is necessary to iterate that the "sound-proofing" does not fully mitigate for the impacts of increased overflights and increased ambient noise.	Refer to response to Comment 85.28.
85.175	Air Quality	Model	With respect to odor impacts that may be associated with the proposed project, we believe the modeling approach used by Massport to be flawed and to require substantial enhancement.	The modeling of hydrocarbon emissions (used as an indicator of odor) was performed using MDEP-approved methods and is accurate.
85.176	Delay	Model	Questions why the Airport Machine Model and not the FAA-approved SIMMOD Model was used for capacity and delay analysis.	FAA recognizes and approves the Airport Machine model. In fact, the FAA helped fund Massport's acquisition of the Airport Machine for taxiway studies at Logan Airport. SIMMOD is an older, more general-purpose model that is most useful for airspace studies rather than capacity and delay analysis of runways and taxiways. The Airport Machine Model used in the analysis was developed to reflect operating conditions at Logan Airport.
